Farmers Must Solve Their Own Problems—By Samuel Gompers

For More Orderly Marketing

State Department, WEAF and A.A. Broadcast Daily Market Reports

As announced last week, American Agriculturist, cooperating with the New York State Department of Farms and Markets and with WEAF broadcasting station, is now furnishing a radio market service every Tuesday, Wednesday, Thursday and Friday morning. These market reports are broadcast at 10:50 A. M. Eastern Standard time. Reports are gathered by experts out of the market and represent the exact status of the market right up to the time of broadcasting. We are enthusiastic about this service and

reports will be given slowly so that you will have no difficulty in setting them down. On this report, somewhere, there is at least one product in which you are interested. For instance, there are few farmers, or farmers' wives, that are not interested in New York City poultry and egg prices. Last minute quotations will be given every day on these products. If the market is firm and a particular product in high demand, you will know it and can get your product in immediately. If, on the other hand, there is an over-supply or glut, you can save yourself

products on that market to the best advantage. Tell us in a letter how to improve this service. Tune in on WEAF 10:50 Eastern Standard time (Wave length 492 meters).

Remember the Date

Radio Market Service

THE following market report is furnished by the New York State Department of Farms and Markets cooperating with American Agriculturist. This report is broadcast every Tuesday, Wednesday, Thursday and Friday at 10:50 A. M., Eastern Standard time, through radio station WEAF of the American Telephone and Telegraph Company, on wave length of 492 meters. Prices represent sales by original receivers in the wholesale produce markets in New York City. Fruit and vegetable prices represent sales up to 7 A. M. Eastern Standard time. Prices on other commodities represent sales up to 10 A. M. Blanks for filling in the prices will be furnished free of charge upon application to American Agriculturist, 461 Fourth Avenue, New York City.

A Reproduction of Each Side of the Market Report Form, Issued by American Agriculturist

are having much to say about it because we know that if you make the most of it, it will save you money in marketing your farm products this year. There is printed on this page a reduced copy of the forms from which the reports are made. We will be glad to furnish upon application to American Agriculturist, 461 Fourth Avenue, these blank forms free of charge. If you keep them near your receiving set with a pencil handy, you can fill in the blanks with that day's prices as they come out of the air. Only the prices of those products that are in season will be broadcast so there will be some items on your blank each day which will not be filled in. The

tremendous loss by holding it a few days or sending it to some other market. We expect to quote Newark and Philadelphia prices a little later. Will you not cooperate with us in helping to make this service reach as many people as possible? Perhaps some arrangements can be made with some local farm organization, storekeeper, milk station, or weekly newspaper to post these reports so that everybody can find them each day. Here is an opportunity to help yourself and help your neighbors market their farm products. Farm people know how to grow stuff, but we have not learned as yet how to sell it well. Here is a chance to study the greatest market in the world and to learn how to put your

cial standpoints, greater in scope, more interesting in appeal, and more educational in its influence than has ever before been attempted in an exposition of this character. Every dairy interest will be represented—the amateur and professional dairyman, the creamery man, the cheese manufacturer, the ice cream manufacturer, the banker and financier, the community builder, and the student of dairying from whatsoever angle will find something of value and of interest to him at this great show. Be sure to vote on the Prohibition issue, see page 5. Sign your name and address. Only initials will be used on letters published.

Farmers Must Solve Their Own Problems

Legislative Cure-alls Will Not Bring Prosperity

IF the farming interests of America can devise no sounder methods of maintaining their proper place in the economic scheme of things than a resort to legislative cure-alls they are inevitably doomed to disappointment.

I see no reason why farmers need to expect hope from anything that does not also offer hope for labor; and labor long since abandoned any dream of salvation through politicians.

This conference, called by those whose present trend of thought at least is toward political remedies, must turn its feet toward paths that lead into the economic structure itself if it wishes to work real benefit and point to lasting and sound methods.

I have heard much about the alleged disproportionate income of industrial wage earners and farmers. Some have pointed out that one of the things greatly to be desired is an increased market for wheat. They propose to pattern after industry and teach the people to eat more wheat. Let me remind you in passing that you will not induce people to eat more wheat if you threaten the income out of which they buy wheat.

Farmers complain of the state of their market to-day. I join with you in lamenting the inadequate income of the farmer, but I venture to assert that the income of the farmers can never be greater if industrial wages are either to stand still or go down. The product of the farm is largely bought by the populations of the cities and the populations of the cities are composed mostly of wage earners.

There is throughout America to-day a comparative state of prosperity because there is a comparatively high average buying power among the workers. Wages are not what we would like them to be in a great many cases, but at least they are not the wages of poverty. They are wages that permit workers to buy and to exercise some choice in the range and quality of their buying.

The state of the farmer may be described as an economic maladjustment; and that being the case, it can be righted. It seems easy to rush to the law-makers, and ask for law. Let me assure you, out of a long and active experience, that there is no great magic in a law. You will not stop the economic machine and reverse its operation by the enactment of a law. About the best that a law can do is to go along with a ripening public sentiment or a ripening economic development.

There are many law-makers, some farmers and some wage earners who forget that we are living in an industrial civilization. The

By SAMUEL GOMPERS

economic forces of our time ride on, developing and changing in accord with the progress of human needs, invention, and the supplies of raw materials. The dominant character of a civilization is and must be reflected in its customs, its laws and its manner of life. Study history to find out about that.

Law-makers a decade ago were furiously engaged in trying to "bust the trusts." Political campaigns were fought on that issue. The graveyards of the decade are not filled

living that has progressed somewhat in accord with and in relation to the increase in volume production.

Europe talks about its proletariat, and it has a proletariat. Europe talks about its peasantry, and it has a peasantry. The United States has neither of these, for two reasons. It has neither the economic conditions nor the state of mind that produces a proletariat and a peasantry as those classifications are understood in Europe. Even if we had ever had a proletariat and a peasantry, which we did not,

mass production would have put an end to both. Because American cities have no proletariat, American industrial wage earners are free in mind and in fact to proceed to work out their salvation through organization and cooperation within their industries. Our minds are not frozen by any ingrained sense of belonging to a given status. We are free to accept whatever facts we find and to use them as seems best. That applies with equal force to our farms. And let me add that the farmers of our country will, if they know their history, proceed to find remedy and improvement through organization within their industry. There are all manner and varieties of evangelists shouting from the house tops, demanding miraculous works from politicians, and the poor politicians are being driven to desperation. I am perfectly

Whether You Agree With Him or Not

WHETHER you agree with all that labor organizations have done or not, you will find little to disagree with in Samuel Gompers' article on this page. This speech was delivered at Chicago on June 20 at the conference on the wheat situation, which was trying to devise ways and means of giving the wheat growers more money for their product.

"Sam" Gompers was the first president of the American Federation of Labor since its start in 1886, and with the exception of one year, has been its president ever since. This is a remarkable record in leadership particularly of any great new organization that has had the bitter ups and downs that labor has been through. Through all that time, Gompers has been opposed to, and has fought down radicalism. He has retained his leadership through stormy and critical periods mainly because he used his great ability towards constructive ends.

Nearly all farmers will agree Mr. Gompers is right when he says that farmers cannot hope to get help from politicians, but should resort "to your own power, your own capacity and your own intelligence."—The Editors.

with the remains of busted trusts, but they are well populated with the skeletons of forgotten laws and law-makers. The trusts are greater than ever. It has been possible to curb some of their practices and to prevent some practices, but the essential structure has stood because it was economically right and moreover economically inevitable.

I point to these things to help make clear my thought. The road to right practices, right developments, right compensations for various kinds of useful service is not through Congress or State Legislatures. These may lend a helping hand and they may clear the road; but they cannot build the body of our effort nor shape our course.

Let us look at the specific economic condition affecting the farm community.

In the last ten years there has been no increase in the farm population of our country. Despite this, the farms raise crops to feed an addition of 14 millions in our population and enough to increase annual farm exports from seven and one-half million tons a year to seventeen and one-half million tons a year.

The per capita volume production of our farms has increased amazingly. The industrial production has likewise increased, but the industrial workers have found a way to command for themselves a standard of

willing that they should be driven to desperation; and there are a lot of political crooks and charlatans whom I would joyfully see driven clear out of the game; but all of that brings home precious little bacon, either to farmer or wage earner.

If the wage earners of our country had not the sense and the courage to organize, nobody would have much sympathy for them and nobody would take their complaints very seriously. Gentlemen, the temptation to say, "go thou and do likewise," is almost beyond my power to resist.

I should like to give you another reason for resorting to your own power, your own capacity, your own intelligence. You will not admit that you have not the intelligence, for almost anyone of you within hearing of my voice could tell what is wrong and how to fix it. I think most Americans do that with great facility. You know what is wrong and you know what ought to be done, but when it comes to doing it you are not in position to act as a unit, to pool your thought and your power for a single purpose. You are disorganized.

The best knowledge of an industry or an occupation is to be found within that industry and that occupation. Farmers know more about farm problems than anyone else

Look Out For San Jose Scale

IF you look closely you will be very likely to see some San Jose Scale in your orchard. This scale is dangerous. It was once bad throughout the East, but was pretty well cleaned out by the efficient spraying campaign aimed against it. Because of the lack of recent attention, it is now on the increase again. Look for it carefully and have it in mind to spray to control it during the next dormant season.

By the way, do you know about the splendid spray service which existed in ten counties in New York State during the past season? In each of these counties an expert is employed with laboratory facilities. Constant use is made of the telephone to get the spraying at the right time, and numerous field demonstrations are held. If your county wishes to line up with those who already have this service for the coming year, you should get in your application immediately in order that the proper arrangements may be made and qualified men secured. Write the New York State College of Agriculture for further details.

Cool the Milk

MOST dairymen have learned that it is easier to cool milk below the requirements than it is to quarrel with the dealer's representative at the local station. If he obeys orders, there is but one thing for him to do and that is return the milk if it is not down to the required temperature.

The critical time of the whole year in the care of milk is now at hand. During July and August, and usually extending into the fall, there are hundreds of thousands of dollars lost because milk has not been properly cooled. If you have plenty of ice, now is the time when you will appreciate it and will realize that it is practically impossible to dairy it under modern regulations without it. This is particularly so if you have a large body of milk.

If your ice is limited, or you have none at all, or the volume of your milk is small, you may be able to worry along through

the hot spell by taking extra precautions. Nearly everyone knows that frequently stirring the milk helps to cool it rapidly. If the can is put into the water and the milk poured into it as it is milked, without waiting to fill the can, the milk will be much more likely to keep longer.

If only well water is used, it should be changed more than once on hot nights. If spring water is relied upon, it should be arranged so that there will be a constant flow of water through the tank. Blankets soaked in ice cold water and placed on the cans before starting to the station will help to keep the temperature down.

Alfalfa in the Orchard

WILL alfalfa retard the growth of a young apple orchard? The experience on American Agriculturists' farm indicates that it will.

All but about twenty acres of the hundred odd acres in our young orchards are under cultivation. There has never been any doubt in our minds that the only way to get an apple tree to make its best and most rapid growth is by constant cultivation, but we are such great believers in what alfalfa will do for the soil that with a twenty-acre orchard we made exception to our cultivating practice and sowed it to alfalfa. The result for two years has been a splendid growth of alfalfa, but a slowing up in the growth of the apple trees, as compared with the same age trees in the cultivated orchards.

Is it possible that the alfalfa aids trees to get enough nitrogen, but not enough of the other plant food elements? If this is the case, then would applications of acid phosphate with some potash applied close to the trees help them? Or must we plow under this splendid alfalfa sod? Does the alfalfa hurt the trees by taking moisture away from them?

The whole question of what is best, the sod mulch or frequent cultivation for young and old orchards, has never been really settled. If you have had some experience with either method, or if you have any observations on any part of the problem of bringing fruit trees to their maturity as quickly and with as little expense as possible, let us hear from you that we may pass on your experience to others.

The Cost of Going It Alone

AT the recent annual meeting of the Dairymen's League Cooperative Association, President Slocum said in his report: "Cost of production plus a reasonable profit is now within the realm of possibility, and I ask this question, 'Why are we not getting it, why was the price of milk reduced last month and this, why were four millions of dollars taken from the incomes of the dairymen in this territory in just two months?' Why? Because some farmers still believe in going it alone or in competing groups.

"By such a state of affairs, no relief can ever come. I am speaking now to all dairymen, both organized and unorganized. We are standing in our own light. Our petty difficulties should be cast aside and we should all get together. In comparison to the big broad viewpoint a farmer must take in solving this gigantic marketing problem; the difference of opinion existing between us as individuals or as groups are mere details easy of solution."

President Slocum's words hit the nail squarely upon its head. This is the day of cooperation and organization. There are three great units in our industrial system to-day, labor, capital and that combination of both of these, known as agriculture. Capital is well organized; so is labor. While the farmers have made wonderful progress in organization, the last few years, there are

still thousands of them unorganized. This is true of the milk business in this section. There are still many dairymen not in any organization, and the organizations themselves are not cooperating.

Two things, therefore, are needed before cost of production plus a reasonable profit can be hoped for. First, dairymen must join some good milk producers' organization, and then these organizations themselves must work together in some kind of a federation.

The Gasoline Age

NOT so many years ago we had a horse on the home farm that was afraid of automobiles. Not more than one car a week passed, but that was one too many. In spite of the strongest hands on the rein, the moment the car came in sight Old Prince would turn squarely around, overturning the wagon, or else make an attempt to drape himself and his unfortunate driver over the top cross-piece of the nearest telephone pole. The word "detour" was not so common as it is to-day, but it was Prince's middle name. The slightest sign of an approaching car was the signal to his driver to get him hastily through the roadside fence for a long side trip through the meadow or pasture lot.

Yesterday we drove a hundred miles along a main highway and we could not help thinking what a whale of a time Old Prince and especially his driver would have if they could have been along. There were at least four thousand automobiles on the road. What a change in transportation methods in a short ten years!

This has indeed been well called the "gasoline age," and one of the good things about it, is that there is just as large a proportion of country as city folks who own and drive automobiles. The moderately priced cars have brought out-door life, fresh air and recreation to millions of people.

The constant wonder is, where does all the money come from to buy so many cars, and the gasoline to run them. Of course, not all of them are paid for, but probably most of them are, and anyway, some one has to put up money for those that are not. Watch almost any main highway in America on a Sunday or a holiday, count the thousands of cars that pass and you will agree that the majority of common folks of this country, the great rank and file, have had more money to spend in the last decade than ever before in American history, and this is as it should be, providing that at least a small sum is constantly saved for the times that may not be so good.

Quotations Worth While

A friend! What is a friend? My friend is he who laughs with me, who weeps with me: one who encourages, praises, rebukes; who eats terrapin and turkey or bread and salt with me: who comes to me at the wedding feast, or stands with me beside the coffin: who listens to my hopes, my fears, my aims, my despair: who rejoices in my successes: who does not despise me in my misfortunes.—CHICAGO TRIBUNE.

* * *

The fact is, 'squire, the moment a man takes to a pipe he becomes a philosopher. It's the poor man's friend; it calms the mind, soothes the temper and makes a man patient under difficulties. It has made more good men, good husbands, kind masters, indulgent fathers, than any other blessed thing on this universal earth.—SAM SLICK, the Clockmaker.

* * *

The most completely lost of all days is the one on which we have not laughed.—ANONYMOUS.

"Success comes in cans—failure in cant's."

Are Farm People For Prohibition?

Emphatic Letters on Both Sides of the Question—Be Sure To Vote

EDITOR'S NOTE.—Letters are coming thick and fast in response to our editorial "Do Farm People Want Prohibition?" On this page we are printing all the letters we have room for. You will notice that the letters represent both sides of the argument, and you will also note that they are direct from the shoulder. Let them come, and if you don't have time to write, you at least can vote "yes" or "no" on the ballot on this page. Get busy with your friends and see that farm opinion is counted on this great problem.

I READ the letter in your issue of June 16 heading your article "Are Farm People for Prohibition?" If they are not they certainly ought to be, and so should every other organization in the United States. If taxes and other expenses must be kept down by allowing intoxicating liquors back, then let them soar.

The writer of the letter does not allow his or her name published and I can't say I blame him, I wouldn't either if I held such views. Says he is a strict abstainer, but "I am from Missouri" and don't believe anyone who is a "strict abstainer" has any such views. There certainly is no curse about prohibition and if this fair country of ours isn't to be a second Russia, it is time we get together and stamp out intoxicating drinks entirely.

I suppose the writer is one of those people who sit up and howl about prohibition taking a man's personal liberty away from him, but if he is an abstainer, why should he care whether people are allowed to make booze or not. I am for prohibition and laws so strict every bootlegger and still owner in the United States goes behind the bars and stays there. Use your own pleasure about publishing this and sign my name if you like.—D. B., Chemung Co., N. Y.

DOES THE TAIL WAG THE DOG?

IN your June 16, 1923 issue of American Agriculturist, you ask that farmers write you short letters giving their views on prohibition. It would be hard indeed for me, a born farmer, to give my views in a short letter. I can give you a plain answer, however, in the commonly accepted terms of the day by saying, though the whole world may be dry, I am wet.

Did not Christ turn water into wine at a notable wedding that all might make merry? I know our laws are not perfect, as one whom I had befriended swore to a big untruth, and a number of others to make the first one good, and defrauded me out of several thousand dollars a few years ago.

There seems to be no remedy in law for some of the most outrageous wicked and inhuman acts of our fellow men on which the law places its stamp of approval.

It is the abuse of alcoholic liquors, not their use that causes trouble. I for one cannot agree that this question is settled as it should be at this year of the twentieth century when liquor is handled as openly and at the high prices that prevail in our cities. As to quality of liquor drank to-day we need only consult our daily papers.

Contrast this with the condition of affairs that existed within the memory of many men now living when good whiskey was sold at our general stores at about 20 cents per gallon.

In 1794 George Washington called out fifteen thousand of the militia in Pennsylvania to compel the payment of a tax on whiskey.

By A. A. READERS

Are we dealing with whiskey in a more intelligent manner to-day?

The days of prohibition are surely numbered if some men continue to own barrels of liquor and the great majority of our population continue to find it impossible to obtain small quantities for their own many uses.

I for one think it should be our own affairs what we eat and drink in a free country and not be blessed with such a fine country that its citizens must consider a fine every day of their lives.

Would it not be as near right to prohibit certain kinds of food because we have a few gluttons, as to prohibit certain kinds of drink because we have a few drunkards?

When a large percentage of the population

people were blinded to allow the enactment of which Volstead is guilty.

So far so good. The law suppressing saloons would have done well enough and would probably be found good yet by the majority. But the lawmakers, whipped in line by some unseen power and unknown but guessed at, made it a crime to make, to barter, to sell or give away alcohol or anything containing alcohol, not only attacking personal liberty but compelling the farming communities to allow to go to waste a large quantity of material which collected and turned to industrial alcohol would prove a boon to the whole country.

Kindly stop thinking of alcohol as a beverage and turn your thoughts to the usefulness of the liquid. In this time of coal distress, alcohol would keep us warm by its genial flame in the stove, would cook our

meals, could run the engine or the automobile, but perhaps gasoline and kerosene might have to drop a few cents a gallon. Coal would not be so much a necessity and with a distillery in a country neighborhood, farmers could take their all cull fruits, corn, potatoes, etc., etc., as they take grain to the mill or the milk to the creamery, thereby receiving freightage on fuel and turning to by-products the tremendous amount of waste on the farm brought about by the Volstead Act.

If alcohol is such a terror to mankind why has the Creator made it so plentiful?

Let the prohibitionists turn their eyes to the results of their work; a large majority of our citizens made outlaws, but not caught, secret drunkenness caused by homebrews of thousands of various recipes, of compounds far more injurious than ever beer or wine properly made and aged could be, thousands debilitated by vile drugs bought in the secret markets of outlawry, thousands engaged in smuggling prohibited

liquids, looting of government warehouses, big expenses trying to enforce in time of peace a measure thought good in war time. And the result is nil, as any one desiring it can procure the favored drinks if he has the price.—A. L. T., Bucks Co., Pa.

80 PER CENT FOR, NOT 70 AGAINST

HAVING just read an article written by one of your readers in regard to the popular sentiment among the farm organizations as to the repeal of the Volstead Act, I decided to give my views on this matter.

The writer stated he believes seventy per cent of our farm organizations favor repeal, that this law was as unwelcomed as a rattlesnake in bed. He later states he is a total abstainer. He may be, but those who generally experience snakes in bed are the ones who imbibe excessively. He may be a total abstainer as he states, as far as drink goes, and truly he is as far as sensible thinking and sane reasoning goes.

The law was never enacted to aid the abstainer, but to remove the curse of drink from those who do, and the children growing up, and not permit such an outrage to go on legalized by our Government. Intoxicating drink in any form never did any of us any good.

On the contrary it has done much to make fools, paupers, murderers and what not, out of what would have been with-

(Continued on page 10)

Prohibition—Yes? No?

DO you want prohibition? The most discussed and most important problem in America to-day is the Eighteenth Amendment. Do the American people want prohibition? The wets emphatically say "no," and the dries are even more emphatically for it. Both sides claim a majority. Which is right? What do farm people think about it?

A majority of farmers think sanely and straight, and their opinions, therefore, on any problem, if they will express them, goes far in determining the outcome. Farm people are busy and are slow to express their opinions in writing; therefore, things get by that are against their interests.

American Agriculturist is taking a vote of its 120,000 farm families on prohibition. It is a vital issue before the American people. Whether you are for it or against it, be sure to vote on the blank lines below. Cut it out and mail it to American Agriculturist, 461 Fourth Avenue, New York City. Your name will be kept confidential, unless you wish it signed. Get other voting members of your family and your neighbors to send in their vote.

Just answer the following questions either here or on another piece of paper and send it in.

1. Are you for the Eighteenth Amendment as it now stands, with strict enforcement of all prohibition laws? Answer yes or no.....

2. Are you for light wines and beers?.....

If you want to give us your reasons for your answer, use another sheet of paper.

3. Name.....

4. Address.....

of any community are compelled to submit to a famine in some line of goods they consider necessary, it surely is a case of the tail wagging the dog.—E. A. G., Wayne Co., N. Y.

"MILK IS A BETTER DRINK"

JUST a line to let you know that I am one in favor of prohibition, the 18th amendment, and its most vigorous enforcement.

Why should any farmer wish to bear the burden of the pauperism, imbecility and crime caused by booze. Milk is a better and safer drink for the workingman than beer.

If the idle rich will have the stuff, let him pay bootleg prices and run the risk of "Crossing the Bar." There should be "no sadness of farewell" when he departs. To compare prohibition with a rattlesnake seems too funny. I always have supposed that it was the light wine and beer that acted like that.—O. L. S., Washington Co., N. Y.

ALCOHOL MORE THAN A BEVERAGE

YOUR item "Are Farm People for Prohibition?" in June 16 number has interested me to the extent of sending you my ideas on the subject.

War time conditions and pre-war habits pre-disposed the people to favor prohibition. Excitement was in the air and the alcohol drinking habit made it rather a necessity to stop gatherings in saloons and all other causes of excitement and the eyes of the

Our earnings in hauling your products

THE Government does not guarantee us any income.

The rates fixed by the Interstate Commerce Commission are intended to be such as will enable the railroads as a whole to earn at least 5¾% on the value of their properties. Out of this net income they must meet interest on debt, pay dividends to the stockholders and build up a surplus as required by prudent business management.

The railroads earned 3.31% in 1921, and 4.14% in 1922. This year they hope to do better. They must do better if necessary new capital is to be attracted to railroad development.

It was only during the period of Government operation that railroad net income was guaranteed. That income was based on pre-war earnings, and averaged 5½% on the value of railroad property.

If any railroad fails to earn 5¾% on its investment, the Government doesn't make up the difference; and the law provides that anything earned above 6% must be equally divided with the Government.

As stated by the Interstate Commerce Commission in a recent decision, the rate provision of the Transportation Act "carries with it no guarantee", but "it is, instead, a limitation".

4 TIMES Around the World with ONE OILING 100,000 Miles Without Stopping for Oil

An inventor who could develop an automobile, a railroad car or any other conveyance on wheels which would perform such a feat would be considered a wonder. But such is the record of regular accomplishment by the Auto-oiled Aermotor during the past eight years in pumping water.

Did you ever stop to think how many revolutions the wheel of a windmill makes? If the wheel of an Aermotor should roll along the surface of the ground at the same speed that it makes when pumping water it would encircle the world in 90 days, or would go four times around in a year. It would travel on an average 275 miles per day or about 30 miles per hour for 9 hours each day. An automobile which keeps up that pace day after day needs a thorough oiling at least once a week. Isn't it marvelous, then, that a windmill has been made which will go 50 times as long as the best automobile with one oiling?

The **Auto-oiled Aermotor** after 8 full years of service in every part of the world has proven its ability to run and give the most reliable service with one oiling a year. The double gears, and all moving parts, are entirely enclosed and flooded with oil all the time. It gives more service with less attention than any other piece of machinery on the farm. To get everlasting windmill satisfaction buy the Auto-oiled Aermotor, the most efficient windmill that has ever been made.

Do Cows Need Exercise?

The Possible Danger of Continuous Stabling

EVERY year an increasing number of dairymen are installing some system whereby the cows have access to water at all times. This is sound dairy practice and a good investment. Nobody questions the fact that it is better for a cow to have water always before her so that she may drink at will, rather than be obliged to try to drink enough at one time to last her for twelve or even twenty four hours. But out of these systems of stabling watering devices there is very apt to grow up the custom of continuous stabling, the cows never being released from the stanchions for months at a stretch. Our fathers—or grandfathers at any rate—never had any doubts about the necessity of exercise for cows. Rather they went to the opposite extreme. They thought of the barn as a sort of night-time jail or lockup for cows, but as a rule they spent the daylight hours in the barnyard around the strawstack. Now I believe we have wasted a good deal of sympathy over these cows. Let us remember that the cow was native to a region where the climate was fairly severe, but perhaps less so than in the Northeastern States. We spend a good deal of time and money in providing warm stables, but in my own thought it is in order to keep our water pipes from bursting rather than from any fear that a well fed, healthy cow is really uncomfortable at a temperature a few degrees below freezing.

J. VAN WAGENEN, JR.

I remember reading a report concerning a Holstein cow in Michigan that made a rather remarkable 30-day record in a stall with only a single thickness of boards between her and zero temperatures outside, and where much of the time it was below freezing, but of course she was dry, well bedded and abundantly fed. From personal experience I feel sure that once we have water buckets installed, there is a constant temptation to pass on to continuous stabling and I do not believe that there is any authoritative teaching as to either the wisdom or the folly of this plan. Now to begin with, it is possible to say a good deal in favor of the practice. For one thing it is a labor-saving method. To let a cow loose and turn her out and then get her back into her stall again is a considerable item in her daily care. Then there is another item perhaps rarely considered. Cows exercising in an open barnyard are certain to leave there a very considerable proportion of their manure—a much larger proportion than would be indicated merely by the time spent outside. In those days when a good horse represented the fastest method of cross country locomotion, Henry Ward Beecher is said to have loved the fast stepping ponies, his argument being that "time lost on the road is gone forever." Well, I judge that manure deposited in the barnyard has as a rule gone beyond the ken of the dairyman for all time. I am going to hazard the guess that two hours a day spent outside would result in the loss of say 20 per cent of the manure—a loss worth thinking about. Perhaps most people will smile at this for being as the Scotch say "near," but I am not ashamed of the argument.

There is yet a third item. The cow

is a creature of routine and probably, I say "probably," but am open to conviction, will give more milk standing in a stall by the month than she will if given the freedom of the yard for part of the day. So much in favor of continuous stabling. The foregoing statements it seems to me are of the type that do not admit of much debate or questioning.

Now when we come to the other side of the question we have no well-proven ground to stand on. We do a good deal of continuous stabling on Hillside Farm, but I admit that I am not in my own mind well satisfied that it is the proper thing to do. I am afraid it is mainly a concession to convenience. Dairying is a long time business and we must look beyond this month or this year. We cannot be sure what will be the ultimate effect upon the health and vigor of the herd.

Now I am not worrying over T B, despite the fact that we once lost 38 head in one test. No amount of close confinement can give a cow T B unless the germ is somehow introduced and if we are so unfortunate as to get a bad spreader, no amount of outdoor air or exercise will insure against future disaster. In any case, in the long run T B is much less serious and much easier to control than abortion and barrenness.

Now the business of dairying is making progress. We are on the whole very much better dairymen than our grandfathers were. We have better cows to begin with and we feed more wisely and liberally. The average milk production of the cows of the country attests these facts. On the other hand I am very much afraid that we do have more trouble—especially along the line of abortion and failure to breed than was the case a generation or two ago. In part this may be a mistaken idea, resulting from the tendency to magnify present ills and to forget old time disasters. Part of it may result from the fact that we have far more traffic in cattle and hence a wider dissemination of infectious diseases. Some of it may result from feeding so liberal that it becomes crowding or forcing, but may it not also be true that we need at least a partial return to methods now considered as primitive and outgrown? You see I am not dogmatic or cocksure. I am only putting into words some of the doubts and questions that are running in my head. Is it sound to put a cow in stanchion from November until May and never let her loose?

In any case the dairy cow is about the only animal which we treat that way. I think the most important aspect of the case is the effect upon reproduction. I begin to believe that the calves of some of the cows have less pep and vigor when dropped than we would like to see. In fowls, every egg is the physiological equivalent of a birth and poultrymen are agreed that there can be no satisfactory egg production unless the flock is kept active—we might almost say "made" to exercise. To keep a brood sow idle in a close pen is simply to invite disaster at farrowing time. The lustiest colt is dropped by the mare that has pulled the plow and harrow all spring. We go to a good deal of trouble and inconvenience to give the dairy bull exercise, and without it his usefulness often ceases in what is practically early life. Even the prospective human mother is exhorted to keep active either by doing the family washing or playing golf, the prescription varying according to her "social position," but we seem to be in danger of forgetting all these lessons when it comes to the matrons of the dairy herd. Physiologically at least the weight of evidence is against continuous stabling.

ROOM FOR ARGUMENT

AS Mr. Van Wagenen points out in his article on this page, there is chance for a good deal of disagreement and argument on the particular question he raises in the care of dairy cows. Comparatively little has been written or said about this important subject and, therefore, we will be glad to have your opinion in a short letter written from your actual observations and experience.—The Editors.

Apple Growing Advancing

Interesting Facts Revealed in Pennsylvania Survey

APPLE growing to-day is a distinctly business proposition. Only those men who are qualified to underake it in a business-like way can expect to succeed. This statement is borne out by the fact that while during recent years, there has been a rather general decrease in the total number of apple trees, that decrease has occurred largely in the old farm orchards rather than in commercial plantings. Thus in the report just published of the survey of the Pennsylvania apple industry, made jointly by the Pennsylvania State College and the State Department of Agriculture, it is shown that while during the last 20 years, there has been a de-

sandstones which form the ridges overlooking the valleys. Trees in the northern section of the State have been planted usually 40 feet apart. In the southern districts, the spacing has been from 30 to 33 feet. This has been found to be too close, however, and the newer plantings are being spaced more widely—from 35 to 40 feet apart. Fillers have become popular. Peaches have been used, but since the two fruits require somewhat different care, many growers use early apples instead. Probably three-quarters of the orchards surveyed are plowed before blossoming time. The largest group of

TABLE 1.—FERTILIZER TREATMENT AND RESULTS

Treatment	Condition of Trees Per Cent of Total			Total
	Good	Medium	Poor	
Sod with Fertilizer.....	48	42	10	100
Sod without Fertilizer.....	20	27	53	100
Cultivation with Fertilizer.....	71	27	2	100
Cultivation without Fertilizer.....	19	43	38	100

crease of about 4,750,000 apple trees in that State, the commercial apple industry is advancing in almost promising manner. This is but one of the interesting facts revealed by the survey, which is of wide interest and value because of the importance of Pennsylvania among apple-growing States. For example: About one-third of the growers included in the survey had spent from seven to eight years as hired men, tenants, etc., before buying their farms. There were more growers between the ages of 40 and 50 than in any 10-year age period. The next largest group was between 50 and 60 years old. There were as many fruit farm owners over 60 years of age as there were between 30 and 40. A surprisingly large percentage of growers started without previous training. Among the most successful were found doctors, engineers, teachers and business men. All but 33 of the growers questioned were Pennsylvania born. The estimated costs of growing, picking and packing a barrel of apples

growers cultivate four times. Nearly as many cultivate from five to seven times. Cultivating is over and the cover crop seeded in by the third week in July. Clover, either alone or with the other legumes is the most common cover crop of the non-leguminous crops, rye is found most often. Where the season is long enough, the usual rotation is corn, wheat and hay for the main crop, with small acreages of oats and potatoes. Where the season is shorter, part of the wheat usually is replaced with oats and the potato acreage largely increased. Apparently because of somewhat different fertilizer practice and more favorable climatic and growing conditions, Pennsylvania apples do better in sod than do those of New York or Ohio. Thus nearly one-third of the acreage surveyed had been in sod three years or more in the last seven. Practically all orchards less than 10 years old, however, are cultivated. Two-thirds of the sod orchards and a large majority of the cultivated orchards were fertilized. Over half of

TABLE 2.—PROPORTION OF GOOD, MEDIUM AND POOR APPLE TREES IN FERTILIZED AND UNFERTILIZED ORCHARDS

Conditions of Trees	Per Cent	
	Fertilized	Unfertilized
Good	62	20
Medium	33	31
Poor	5	49

ranged from 88 cents to \$1.95 before the war and from \$1.06 to \$3.79 in 1919 and 1920. The proportion of the farm in orchard ranged from 20 to 42 per cent. The percentage of the total farm income derived from fruit varied from 28 to 97. The six most profitable varieties as indicated by the combined total of first and second choices were as follows: Stayman 255 York 250 Baldwin 156 Northern Spy 69 Grimes 41 Ben Davis 40 The six least profitable varieties were: Ben Davis 77 York 15 Smith Cider 15 Baldwin 10 R. I. Greening 10 Northern Spy 8

Twenty-six per cent of the growers questioned were planning new plantings totaling 3,126 acres. 110 of them expected to plant Stayman 57 " " " York 26 " " " Grimes 19 " " " Rome 18 " " " Jonathan The favorite soils among the growers are those derived from the shales and

the unfertilized sod orchards were reported in poor condition. Most of the orchards were manured, the frequent interval being three years and the common application, 5 to 10 tons per acre. Most growers used commercial fertilizer applied every year, the one nearly standard mixture being nitrate of soda and acid phosphate, used at the rate of from 1,015 pounds per tree. Bone meal and sulphate of ammonia are also used. A majority of the growers apply fertilizer prior to May. The effect of fertilizer treatments may be shown in accompanying Table, No. 1. Summing up the proportions of good, medium and poor trees under both cultivated systems, when fertilized and when unfertilized are summarized in Table No. 2. Fertilization a Big Factor Thus no matter which cultural system is followed, apparently, but five per cent of fertilized trees may be counted poor, while about half of the unfertilized trees are in poor condition. Diseases and insects have nearly ruined all but the well-cared for orchards. The tractor is replacing the horse to only a slight extent, one horse less, on the average, being found on farms of the same size without a tractor. On a farm of say 200 acres, the num- (Continued on page 15)

No. 1A Pocket Kodak Series II

For pictures you will want to make on the farm, whether for pleasure or business, here is a Kodak that hits the mark.

It is strikingly simple to operate—just open the camera, pull down the bed and the fixed focus lens springs into picture-making position with a snap. It is strictly sized to fit the pocket and neatly finished to please the eye.

Many pictures that you will make need the date and title to complete their usefulness—photographs of crops and livestock, for example. By means of the autographic attachment, found on all Kodaks, you can write the date and title on the film at the time of exposure and the picture becomes a complete, authentic record.

More and Cheaper Silage—Less Labor

THE "powerful compression" Automatic-feed of the 1923 Papec takes the place of an extra man at the feeding table. It handles heavy corn and crooked stalks. It will cut your silo-filling cost and enable you to fill with a smaller crew.

No more heaving and pushing—no more "riding the bundles" with the Papec—use your extra man to throw bundles from the wagon—you won't need him at the feed table.

You can buy this improved cutter, backed by the Papec guarantee, at a price in line with farm products. Simple design, tremendous production and specialized machinery makes this possible. Ask your dealer to quote you on the size you need.

THROWS AND BLOWS

League Price For July \$2.33

County News From Among New York Farmers

THE Dairymen's League Cooperative Association, Inc., announces that the following prices have been voted for the month of July, quotations being given for milk produced in the basic zone of 201-210 mile zone from New York City for 3 per cent milk.

Class 1—for milk that goes into fluid consumption, \$2.33, which is the same price as for June.

Class 2—for milk which goes into the manufacture of cream and ice cream, \$2.05, which is the same as the June price. However, in this class there are slight increases in the skim milk differentials.

Class 3—for milk used chiefly in the manufacture of evaporated, condensed, and powdered milk and hard cheeses, a differential of 85 cents per hundred has been voted above the price of milk going into the manufacture of butter. This is 20 cents above the differential that was voted for June milk, which was 65 cents, as announced in American Agriculturist of June 2.

Class 4a—for milk going into the manufacture of butter, the price will be determined by the average price of New York market quotations on this commodity. However, there are differentials for the skim milk, the by-product in the manufacture of butter, which varies as in the case of Class 2 and these will also be proportionately increased.

Class 4b—for milk going into the manufacture of cheese, will be determined by the quotations of that commodity on the New York market.

The fact that the League is selling the farmers' skim milk to better advantage, should reflect favorably. By disposing of skim milk, a by-product, to better advantage, brings up prices realized by farmers selling into lower classes, with consequent more just recompense to those producers.

COUNTY NEWS FROM AMONG NEWS YORK FARMERS

Oneida Co.—Rain is needed badly at time of writing, June 21. Pastures are holding up well. Many farmers fed their hay up pretty late. The big hay crop of last season seemed to melt away rapidly during Spring feeding. Seed potatoes were in big demand this Spring and hard to find. About the usual acreage of potatoes was planted. Planting of corn for ensilage is just being completed on many farms. Oats are making a good growth. Meadows that have been well cared for, are looking fairly well. Hired help is very scarce and wages are high, \$60 to \$75 per month. Eggs 30 cents per dozen, pork 12 to 12½ cents per lb. As dairymen have all the cows they can handle, there is little sale for dairy cows. Late apples bloomed fairly well.—E. N. A.

Nassau Co.—The extremely hot dry spell of the last week of June, was broken by several thundershowers. Considerable damage was done by the lightning and wind. Old barns were demolished in several instances. Crops in some parts of the county suffered from the effects of the wind but the rain brought the much needed relief. Had the drought and heat continued for many days, there is no doubt that the potato crop would have been seriously affected.

In Western New York

Steuben Co.—At this writing, June 20th, the drought is getting to be serious. Barley and oats have held their color but unless rain comes soon they will go back. Corn is extremely poor as are the meadows. During the Spring the weather was very cold and dry and now it is hot and dry. Strawberries that at first bid fair for a large crop are drying up without attaining any size. Milch cows are selling for \$50 to \$75, dairy butter is scarce. Most all milk goes to milk plants. Spring pigs are worth \$5 each at 4 weeks of age. Old potatoes about all cleaned up.—C. H. E.

Steuben Co.—The hay crop promises to be light. The weather has been too dry and frosty for grass to make much of a growth. Corn is starting out

fairly well but all crops need rain. About the usual acreage of potatoes was planted this Spring. Up to the middle of June, apples had not completed their bloom, at which time about 75 per cent of the fruit had blossomed. The setting of fruit is below the promise of blossoming time. Early strawberries were considerably damaged by frost.—H. I. D.

Chautauqua Co.—The ground is very dry. Crops are in great need of rain. The hay crop will be light. Many farmers have established roadside markets this year where autoists can stop and purchase eggs, milk, home-made ice cream, doughnuts and fruit, etc. Strawberries are selling from 25 to 30 cents a quart. The crop is quite scarce this year. Butter 45 cents, eggs 30 cents, potatoes 75 cents a bushel, poultry 25 cents a pound.—MRS. C. L. B.

Wyoming Co.—More beans have been planted in this vicinity this Spring than in some years. A number of farmers have had to make the second planting as they did not come up good the first time. Hired help is scarce and wages are high. Many farmers who have always kept one or two men are going without any help at all. An improved road is being put up between Dale and the Attica town line. Eggs 25 cents, butter 36 to 37 cents.—J. H. E.

Ontario Co.—We are having a hot, dry spell and a good rain would do a great deal of good. Wheat and grass are looking well, but corn and potatoes are backward. Young alfalfa is looking good but timothy and old meadows are scant. Hay will be a light crop. Every one is hoping that we will have rain soon.—H. D. S.

In the Hudson Valley

Ulster Co.—The Farm and Home Bureaus are going to hold the annual picnic on August 18, at Camp Wallkill, on the New Palz-Kingston state road. The committee in charge of the event consists of E. W. Hathaway, G. F. Rice, Mrs. Elmer Smith, Mrs. W. A. Warren, R. J. Harder, Millard Davis, Luther Duisberre. The committee is reported to be planning several new features for the picnic this year. One of them will be the installation of an amplifier by W. A. Warren of Hurly, in order that every one present will be able to hear what is being said by the speakers.

Rensselaer Co.—Sheep breeders of Rensselaer and Washington Counties shipped four carloads of wool to Boston totaling 45,000 pounds. Prices ranged from 41 to 53 cents. The milk station of H. P. Hood & Son are now handling on the average of 800 cans per day. Recently this company purchased 600 new 40-quart cans to be distributed among patrons of the plant, at a very reasonable price. Farmers are now mowing hay, which is fairly heavy and promises to make a good crop.—C. H. Y.

Dutchess Co.—An anti-daylight saving society has been formed and already 2,000 signatures have been collected. Prices of farm produce are generally pretty good. Farmers will start to dig their new potatoes about July 10. The old potatoes are bringing \$1.75 a bushel, eggs 38 cents. Hired help is getting \$3 a day and scarce at that. Weather is very dry. Grass looks good, but we need rain.—H. H.

1923 NOT UNUSUAL FOR LATE FROSTS

Extremely late season this year has brought forth many comments relative to the seasonal variations. Some observers claim that the Spring of 1923 was the most backward on record. The fact that this is not so is brought out by J. F. Rose of South Byron, N. Y., who has kept a record of blossoming time of his Dutchess pear orchard for 45 years.

The trees blossomed May 24 this year. In 1917 the date was May 26. In 1882 and 1907 they also blossomed on May 26. Last year the blossoming date was May 10. In three years of the record the orchard was in full blossom in April, the years being 1879, 1910 and 1921.

Why Harder Silos don't tip over

THE Harder patented Spline Dowel and square tongue and grooved staves produce a rigid structure that is secure amid the storms.

A leaky silo is worse than none at all. Be sure to get the air-tight kind, the kind that never lean or shear. The name is "Harder," remember that.

Jersey Crops Below Normal

County Notes — Pennsylvania Farm News

ACCORDING to the New Jersey crop report of June, of the United States Department of Agriculture, in cooperation with the New Jersey Department of Agriculture, farm crops in general will be below normal this year. The condition of the wheat crop on June 1 indicated that it will run about 83 per cent normal with an estimated production of 1,290,000 bushels as compared with 1,515,000 bushels, the average production of the past 10 years.

The area of oats seeded this spring is estimated to be 95 per cent of last year's acreage, while the condition of rye was 91 per cent normal. Corn is approximately 100 per cent, with an estimated acreage of 236,000 acres, compared with 264,000 acres, the average area planted in the last 10 years.

Early estimates of the acreage of potatoes planted this season is 84 per cent of last year. On June 1, the condition of this crop was estimated at 89 per cent of normal as compared with 90 per cent last year. Early estimates of the sweet potato plantings indicate that the acreage this year is about 98 per cent of last year's.

On June 1 the condition of hay was estimated at 72 per cent normal, indicating a production of 349,000 tons compared to 485,000 tons and 487,000 tons, the average production for the past 10 years. It is estimated that slightly more clover will be cut this year than last year, although the condition of the crop was considerably below the average of the past several years. There will be more alfalfa cut this year, it is believed, although the crop is only 88 per cent normal as compared with 91 per cent last year. The acreage of timothy for harvest this year is estimated slightly above last year's acreage, although the condition of the crop on June 1 was 72 per cent normal. The pastures are considerably below last year and the past 10 year average.

It is estimated that the apple crop will be of about 78 per cent of a normal crop, indicating a production of slightly over 2,000,000 bushels. The commercial crop is estimated at 468,000 barrels, compared with 522,000 barrels last year; 501,000 barrels, the average production for the last 3 years. The condition of the peach crop was somewhat better, being estimated at 84 per cent. Pears are slightly better than apples, although not quite as good as peaches, being estimated at about a 80 per cent normal crop.

NEW JERSEY COUNTY NOTES

Hunterdon Co.—The drouth during the latter part of June has developed most seriously. During the whole month of June we have had only one shower. Wheat, rye and grass are suffering with dry weather. The pasture on the upland farms are dry. Some farmers have been cutting their wheat and what grass they have to feed their cows, and now some are cutting off their oats to feed to cows. Hay time is here and some farmers have none to cut. It will take two acres to make a load. Corn is looking bad. It got a poor start on account of the cold late spring. Some fields were planted over. Potatoes are looking good. Apples are a failure in this part of the State. All garden truck is suffering from hot winds and drouth.—J. R. E.

Cumberland Co.—We are having very dry weather with intense heat. This combination has played havoc with all crops. Hay will only be a quarter crop. Grain will be poor. Premature ripening will cause shriveled grain. Pastures are drying up, and feeding of cattle has consequently become a necessity. Wheat \$1.15, corn, 90c; oats, 6c; hay, \$20; early potatoes, \$1 a bushel; eggs, 28c; milk wholesale, 6c per quart; live poultry, 20 to 40c.—A. P. S.

PENNSYLVANIA COUNTY NOTES

Fayette Co.—We have had some very dry weather up until about a week ago, when a rainy spell set in. The winter wheat is looking fine and will undoubtedly make a good crop. The prospects for a good oats crop is good.

Meadows and pastures are looking fine. Raspberries and strawberries and blackberries promise an excellent crop. Sweet cherries will be a failure, while sour cherries will yield about a half crop. Some varieties of apples will make a full crop, while others will be an entire failure. Peach crop will be about 75 per cent normal, plums 25, pears 25. The corn crop planted is about 125 per cent normal and is making good growth. The labor question is serious in this section. The more foreigners we get the worse it becomes. It takes two good bosses to get one day's work from one of them. Coal mines are not running very short, only about 10 per cent.—E. WARMAN.

Dauphin Co.—Some splendid fields of alfalfa and sweet clover are being harvested. Wheat has improved wonderfully and may give a good crop. Roads are looking very nice. Corn has been damaged considerably by cut worms. Timothy fields are short, some of them being all weeds. Potatoes look good, acreage has been reduced, bugs are very plentiful. Fruit will yield a fair crop. Wheat \$1.20, corn 90c, oats 55c, potatoes \$1.20, milk \$2.55 per hundred, eggs 28 to 30c, strawberries 15 to 25c, cherries 10 to 20c. Days are warm and nights are cool.—I. F. ALLEMAN.

Cumberland Co.—The long dry spell that we have been experiencing was broken by heavy rains and thunder showers accompanied by hail. Many buildings in this section were struck by lightning and crops damaged. Telephone and electric service was very much handicapped. Crops will be about a month late this year owing to the cool, late Spring. The hay crop, especially clover, will be short. Farmers are now making the first cutting of alfalfa. Corn did not come up very well. Very little stock changing hands, except calves. Some sheep shearing is being done. The farmers are undecided whether to sell or not. Potato bugs have made their appearance in large numbers. Wheat \$1.25, corn 70c, potatoes 60c and eggs 22c.—J. B. KELLY.

Crawford Co.—The weather is cold and nothing is growing very well. Everything seems late. Meadows and wheat are below normal. Pastures are poor for this time of the year. Light frosts were experienced during early June. Butter, 45c; eggs, 20 to 25c; cream, 36c. The dirt roads are in good condition. Road construction work is going on in a number of places in the county. Farmer help is scarce. There is little or no building being done.—J. T. S.

CENTRAL PENNSYLVANIA NOTES

J. N. GLOVER

Cultivation of corn is taking more of the farmers' time now-a-days. The crop is growing rapidly, but could stand a great deal more rain and warmer nights. The timothy crop will undoubtedly be short this year. Clover is shorter on the stalk than usual. Wheat has improved much since it has headed out. Oats is short and up to the middle of June has made very little growth. Pastures are fair.

Early cherries promise a good crop this year. Some varieties of apples will yield well, while others are going to be scarce. Plums will make a good crop, while potatoes will yield only fair.

Wheat has dropped to \$1.20 a bushel, while corn went up slightly to 90c, oats 55c. Old hay is selling slowly at \$16 per ton for the best. Wheat straw \$11 per ton.

Fresh cows have been generally in good demand and good ones are selling up to \$150 or better. Except for the prices received by Dairymen's League for milk, farmers would be more discouraged over the price situation than they are, although many are planning to hold a sale next spring and quit farming.

We think a good deal of the American Agriculturist, and would not care to be without it.—Mrs. E. F. Gardener, Moscow, Pa.

Easier than Whitewash

CARBOLA
The Disinfecting White Paint

It takes less than five minutes to mix the Carbola powder with water and have it ready to use as a white paint and powerful disinfectant. No waiting or straining; no clogging of sprayer. Does not spoil. Does not peel or flake. Disinfectant is right in the paint powder—one operation instead of two. Gives better results, costs less. Used for years by leading farms.

Your hardware, paint, seed or drug dealer has Carbola, or can get it. If not, order direct. Satisfaction, or money back. 10 lbs. (10 gals.) \$1.25 and postage; 20 lbs. (20 gals.) \$2.50 delivered; 50 lbs. (50 gals.) \$5.00 delivered; 200 lbs. (200 gals.) \$18.00 delivered; trial package and booklet 30c.

Farmers Must Solve Their Own Problems

(Continued from page 3)

knows about those problems. Why do farmers think they must run to legislators to find about the things about which they themselves are the best experts?

I have said, and I should like to repeat here, that political government has definite limitations in the ordering of affairs and it can go beyond these limitations only at the peril of the people and their social and economic organization. Political government, for example, is simply not competent to conduct industry, to work out the salvation of industry, or to teach industry in which paths to walk. There is a great gulf fixed between politics and industry. Industry must work out its own salvation, build up its own great governing forces, apply democratic principles to fit its own structure and meet the needs of humanity out of its own intelligence. There is no other force that has the qualifications to take this job away from industry, and as long as organization persists and grows within industry and the intelligence that is in industry devises methods of functioning, no other force can ever grow up that will possess the qualifications.

Our social order has got to develop according to the character of those things that provide its life. In pastoral days and social order took its form from the pastoral life of the people. In our time it must do likewise, and in spite of all the efforts of dreamers to the contrary, it does do likewise.

Is it not logical to apply the same thought to the rural life of the country? Rural and urban life are largely interdependent upon the same major trends and developments.

Individual farmers have fought many manifest evils. They continue to fight. They have developed some organized strength with which they can fight more effectively. In some cases farmers have found a way to decrease abuses, but in every case where progress has been made, organization has been the bedrock of their strength and their progress. I can prescribe nothing short of more and more organization. Wherever there is organization there is a center—a clearing house—for the gathering and disseminating of information of economic experience, of the manifestations within your occupation. The records so accumulated will serve to disclose the wisdom or unwisdom of contemplated policies and undertakings. Something like scientific procedure then becomes possible. The recorded experience of mankind is the only thing that enables us to avoid mistakes that were made a century ago. If it were not for recorded experience—experience recorded in written records and in memory for transmission from day to day and from generation to generation—we should have each day to learn again how to start fire with a whirling stick. Recorded experience in given occupations is no less vital than in our social structure as a whole, no less important in guiding us aright from day to day than in guiding us from century to century. Organization is a means of bringing to a central point for common use the experiences of all.

Council Table the Goal

There is no force in our social organization that will not come to the council table with the farmers when the farmers find the way to bring their strength together at that table. And, let me point out, the council table is the goal. The battlefield is not the goal, much as some may like to make it appear so. The council table means conference, negotiations and agreement. Agreement at the council table is native to our soil. It is fundamentally our way. It is the foundation and the touchstone of democracy. Every agreement between organized groups registers progress and achievement—something positive. Reason finds its place at the council table where equals come together. We are but in the beginning of a great unfolding of democracy. We have but taken the first steps, great and wonderful and gratifying as they have been. Civilizations grow slowly and we shall not end all evil in our time. If we can be conscious of progress we have reason to feel that all is not ill that is among us. But on this point put much emphasis: Progress is not

gained by fiat, nor is it ordered into being by virtue merely of law. More frequently law registers what is either accomplished or recognized. It follows more often than it leads. Put your faith in your own works and see that your works are thorough, diligent and based always upon the needs of your own occupation and guided by your own knowledge of that occupation.

Are Farm People For Prohibition?

(Continued from page 5)

out it, sane, well-to-do, peace abiding citizens.

Would the Volstead Act if carried out make matters worse? Is it right or wrong? Should we farmers, who are eighty per cent for, instead of seventy per cent against this act, let those who do oppose, try to make the general public believe that the farmers favor doing away with the Volstead Act and allow wide open legalized liquor traffic again.

Prohibition must stay put, our children must not be menaced with this curse. Don't let us let our habits run away with us. Come out for square, for the right, and wipe this slavery, which is blackest of all, from our beloved country.

Let us make known where we stand without selfishness thinking of the good to all concerned and then aid in every way those who are trying to make our country a fit place for all to live in.—E. A. H., Broome Co., N. Y.

Speaks for a Maryland Community

ON the Editorial page of the June 16th American Agriculturist, is a letter from a "supposed-to-be" farmer, on prohibition; also your request for "those who are for it—stand up and be counted." A woman is given credit, justly or not, for having a "sixth sense." To me, the "farmer's" letter was at once stamped "false," "whiskey," and "money talking."

As far as I can learn our community as a whole are in favor of prohibition with but one or two exceptions. You would receive many more than your requested ten thousand letters but for one thing, this is such a busy time, we hardly have time to bring the mail in from the mail-box, let alone read it. It just happened to be raining to-day so I took time to glance over the paper.

This is Maryland and reported to be "wet" but get the hearts of the people, especially the women, and you will find with few exceptions that even the "wet" places do not want re-peal but enforcement of the 18th Amendment. Hope you receive more letters than you can read. We enjoy the paper very much.—E. V. H., Wicomico Co., Md.

18th Amendment Should be Amended

IN response to your request for short letters in regard to the stand of farmers on the Prohibition Law, I am moved to say I am in accord with your correspondent who thinks the so-called unanimity of farm sentiment for the present dry law is a myth. Though practically a total abstainer myself I regard the prohibition of such drinks, as beer, nothing short of a crime against many hundreds of thousands of law-abiding citizens. I believe that 75 per cent of the farmers of my acquaintance are against the present stringent law. It is a breeder of lawlessness and revolution and should be supplanted by a much more liberal interpretation of the 18th Amendment.—H. L. U., Dutchess Co., N. Y.

"Never Heard a Farmer Speak for Prohibition"

ARE farm people for prohibition? I should say No. I never heard a farmer speak for prohibition. Of my nearest twelve neighbors, there is only one who would vote for prohibition, and I am not sure that he would. He always takes a drink when I offer him one.—E. B.

Is Education a Factor?

I BELIEVE that over ninety-five per cent of the farmers with a high-school, or more advanced education are for prohibition first, last and all the time.

God Save the State.—I. M. J., Alleghany Co., N. Y.

The Brown Mouse—By Herbert Quick

AND Jim felt something new, too. He had felt it growing in him ever since he began his school work, and knew not the cause of it. The cause, however, would not have been a mystery to a wise old yogi who might discover the same sort of change in one of his young novices. Jim Irwin has been a sort of ascetic since his boyhood. He had mortified the flesh by hard labor in the fields, and by flagellations of the brain to drive off sleep while he pored over his books in the attic. He had looked long on such women as Helen of Troy, Cleopatra, Evangeline, Agnes Wickfield and Fair Rosamond; but on women in the flesh he had gazed as upon trees walking. The aforesaid spiritual director, had this young ascetic been under one, would have foreseen the effects on the psychology of a stout fellow of twenty-eight of freedom from the toil of the fields, and association with a group of young human beings of both sexes.

He would, no doubt, have considered carefully his patient's symptoms. These were very largely the mental experiences which most boys pass through in their early twenties, save, perhaps that, as in a belated season, the transition from winter to spring was more sudden, and the contrast more violent. Jim was now thrown every day into contact with his fellows. He was becoming more of a boy, with the boys, and still more was he developing into a man with the women.

The budding womanhood of Calista Simms and other school girls thrilled him as Helen of Troy or Juliet had never done. This will not seem very strange to the experienced reader, but it astonished the unsophisticated young schoolmaster. The floating hair, the rosebud mouth, the starry eye—all these disturbed the hitherto sedate mind. And now, as he gazed at Jennie, he was suddenly aware of the fact that, after all, whenever these thoughts and dreams took on individuality, they were only persistent and intensified continuations of his old dreams of her. He was quite sure, now, that he had never forgotten for a moment, that Jennie was the only girl in the world for him.

NOW, however, he arose as from some inner compulsion, and went to her side. Still scanning him by means of her back hair, Jennie knew that in another moment Jim would lay his hand on her shoulder, or otherwise advance to personal nearness, as he had done the night of his ill-starred speech at the schoolhouse—and she rose in self-defense.

Self-defense, however, did not seem to require that he be kept at too great a distance; so she maneuvered him to the sofa, and seated him beside her. Now was the time to line him up.

"It seems good to have you with us to-day," said she. "We're such old, old friends."

"Yes," repeated Jim, "old friends. . . . We are, aren't we, Jennie?"

"And I feel sure," Jennie went on, "that this marks a new era in our friendship."

"Why?" asked Jim, after considering the matter.

"Oh! everything is different, now—and getting more different all the time. My new work, and your new work, you know."

"I should like to think," said Jim, "that we are beginning over again."

"Oh, we are, we are, indeed! I am quite sure of it."

"And yet," said Jim, "there is no such thing as a new beginning. Everything joins itself to something which went before. There isn't any seam."

"No?" said Jennie interrogatively.

"Our regard for each other," Jennie noted most pointedly his word "regard"—"must be the continuation of the old regard."

"I hardly know what you mean," said Jennie.

JIM reached over and possessed himself of her hand. She pulled it from him gently, but he paid no attention to the little muscular protest, and examined the hand critically. On the back of the middle finger he pointed out a scar—a very tiny scar.

"Do you remember how you got that?" he asked.

Because Jim clung to the hand, their heads were very close together as she joined in the examination.

"Why, I don't believe I do," said she.

"I do," he replied. "We—you and I and Mary Forsythe—were playing numble-peg, and you put your hand on the grass just as I threw the knife—it cut you, and left that scar."

"I remember, now!" said she. "How such things come back over the memory. And did it leave a scar when I pushed you toward the hot stove in the schoolhouse one blizzard day, like this, and you peeled the skin off your wrist where it struck the stove?"

"Look at it," said he, baring his long and bony wrist. "Right there!"

And they were off on the trail that leads back to childhood. They had talked long, and intimately, when the shadows of the early evening crept into the corners of the room. They had relived a dozen moving incidents by flood and field. Jennie recalled the time when the tornado narrowly missed the schoolhouse, and frightened everybody in school nearly to death.

"Everybody but you, Jim," Jennie remembered. "You looked out of the window and told the teacher that the twister was going north of us, and would kill somebody else."

"Did I?" asked Jim.

"Yes," said Jennie, "and when the teacher asked us to kneel and thank God, you said, 'Why should we thank God that somebody else is blown away?' She was greatly shocked."

"I don't see to this day," Jim asserted, "what answer there was to my question."

In the gathering darkness Jim again took Jennie's hand, but this time she deprived him of it.

HE was trembling like a leaf. Let it be remembered in his favor that this was the only girl's hand he had ever held.

"You can't find any more scars on it," she said soberly.

"Let me see how much it has changed since I struck the knife in it," begged Jim.

Jennie held it up for inspection.

"It's longer, and slenderer, and whiter, and even more beautiful," said he, "than the little hand I cut; but it was then the most beautiful hand in the world to me—and still is."

"I must light the lamps," said the county superintendent-elect, rather flustered, it must be confessed. "Mama! Where are all the matches?"

Mrs. Woodruff and Mrs. Irwin came in, and the lamplight reminded Jim's mother that the cow was still to milk, and that the chickens might need attention. The Woodruff sleigh came to the door to carry them home; but Jim desired to breast the storm. He felt that he needed the conflict. Mrs. Irwin scolded him for his foolishness, but he strode off into the whirling drift, throwing back a good-by for general consumption, and a pathetic smile to Jennie.

"He's as odd as Dick's hatband," said Mrs. Woodruff, "tramping off in a storm like this."

"Did you line him up?" asked the colonel of Jennie.

The young lady started and blushed. She had forgotten all about the politics of the situation.

"I—I'm afraid I didn't, papa," she confessed.

"Those brown mice of Professor Darbishire's," said the colonel, "were the devil and all to control."

JENNIE was thinking of this as she dropped asleep.

"Hard to control!" she thought. "I wonder. I wonder, after all, if Jim is not capable of being easily lined up—"

"Why, I don't believe I do," said she. And Jim? He found himself hard to control that night. So much so that it was after midnight before he had finished work on a plan for a cooperative creamery.

"The boys can be given work in helping to operate it," he wrote on a tablet, "which, in connection with the labor performed by the teacher, will greatly

reduce the expense of operation. A skilled buttermaker, with slender white hands"—but he erased this last clause and retired.

CHAPTER XII

FACING TRIAL

A DISTINCT sensation ran through the Woodruff school, but the schoolmaster and a group of five big boys and three girls engaged in a very unclasslike conference in the back of the room were all unconscious of it. The geography classes had recited, and the language work was on. Those too small for these studies were playing a game under the leadership of Jennie Simms, who had been promoted to the position of weed-seed monitor.

Each child had been encouraged to bring some sort of weed from the winter fields—preferably one the seed of which still clung to the dried receptacles—but anyhow, a weed. Some pupils had brought merely empty tassels, some bare stalks, and some seeds which they had winnowed from the grain in their father's bins; and with them they played forfeits. They counted out by the "arey, Ira, ickery an" method, and somebody was "It." Then, in order, they presented to him a seed, stalk or head of a weed, and if the one who was It could tell the name of the weed, the child who brought the specimen became It, and the name was written on slates or tablets, and the new It told where the weed or seed was collected. If any pupil brought in a specimen the name of which he himself could not correctly give, he paid a forfeit. If a specimen brought in was not found in the school cabinet—which was coming to contain a considerable collection—it was placed there, and the task allotted to the best penman in the school to write its proper label. All this caused excitement, and not a little buzz—but it ceased when the county superintendent entered the room.

For it was after the first of January, and Jennie was visiting the Woodruff school.

The group in the back of the room went on with its conference, oblivious of the entrance of Superintendent Jennie. Their work was rather absorbing, being no more nor less than the compilation of the figures of a cow census of the district.

"Altogether," said Mary Talcott, "we have in the district one hundred and fifty-three cows."

"I don't make it that," said Raymond Simms. "I don't get but a hundred and thirty-eight."

"THE trouble is," said Newton Bronson, "that Mary's counting in the Bailey herd of Shorthorns."

"Well, they're cows, ain't they?" interrogated Mary.

"Not for this census," said Raymond.

"Why not?" asked Mary. "They're the prettiest cows in the neighborhood."

"Scotch Shorthorns," said Newton, "and run with their calves."

"Leave them out," said Jim, "and to-morrow, I want each one to tell in the language class, in three hundred words or less, whether there are enough cows in the district to justify a cooperative creamery, and give the reason. You'll find articles in the farm papers if you look through the card index. Now, how about the census in the adjoining districts?"

"There are more than two hundred within four miles on the roads leading west," said a boy.

"My father and I counted up about a hundred beyond us," said Mary.

"But I couldn't get the exact number."

"Why?" said Raymond, "we could find six hundred dairy cows in this neighborhood, within an hour's drive."

"Six hundred!" scoffed Newton.

"You're crazy! In an hour's drive?"

"I mean an hour's drive each way," said Raymond.

"I believe we could," said Jim. "And after we find how far we will have to go to get enough cows, if half of them patronized the creamery, we'll work over the savings the business would make. Who's in possession of that

correspondence with the Wisconsin creameries?"

"I have it," said Raymond. "I'm hectographing a lot of arithmetic problems from it."

"How do you do, Mr. Irwin!" It was the superintendent who spoke.

Jim's brain whirled little prismatic clouds before his vision, as he rose and shook Jennie's extended hand.

"Let me give you a chair," said he.

"Oh no, thank you!" she returned. "I'll just make myself at home. I know my way about in this schoolhouse, you know!"

She smiled at the children and went about looking at their work—which was not noticeably disturbed, by reason of the fact that visitors were much more frequent now than ever before, and were no rarity. Certainly, Jennie Woodruff was no novelty, since they had known her all their lives. Most of the embarrassment was Jim's.

He rose to the occasion, however, went through the routine of the closing day, and dismissed the flock, not omitting making an engagement with a group of boys for that evening to come back and work on the formalin treatment for smut in seed grains, and the blue-vitriol treatment for seed potatoes.

"We hadn't time for these things," said he to the county superintendent, "in the regular class work—and it's getting time to take them up if we are to clean out the smut in next year's crop."

THEY repeated Whittier's *Corn Song* in concert, and school was out.

Alone with her in the old schoolhouse, Jim confronted Jennie in the flesh. She felt a sense of his agitation, but if she had known the power of it, she would have been astonished. Since that Christmas afternoon when she had undertaken to follow Mr. Peterson's advice and line Yim Irwin up, Jim had gone through an inward transformation. He was in love with her. He knew how insane it was, yet, he had made up his mind that he would marry Jennie Woodruff.

He saw her through clouds of rose and pink; but she looked at him as at a foolish man who was chasing rainbows at her expense, and deeply vexing her. She was in a cold official frame of mind.

"Jim," said she, "do you know that you are facing trouble?"

"Trouble," said Jim, "is the natural condition of a man in my state of mind."

WHAT HAS GONE BEFORE

WHEN Jennie Woodruff asked Jim Irwin and his mother to dinner, she meant to play politics to the extent of persuading him to give up his new fangled way of teaching school and conform to traditional methods. But Jim was a "Brown Mouse," whose theories meant much to him. Col. Woodruff, Jennie's father, thought the former farm-hand had something to him and watched him carefully through the dinner at which Jim held forth on his ideas of a school program related to life.

But it is going to be a delicious sort of tribulation."

"I don't know what you mean," she replied in perfect honesty.

"Then I don't know what you mean," replied Jim.

"Jim," she said pleadingly, "I want you to give up this sort of teaching. Can't you see it's all wrong?"

"No," answered Jim, in much the manner of a man who has been stabbed by his sweetheart. "I can't see that it's wrong. It's the only sort I can do. What do you see wrong in it?"

"Oh, I can see some very wonderful things in it," said Jennie, "but it can't be done in the Woodruff District. It may be correct in theory, but it won't work in practice."

"It works," said Jim. "Anything that's correct in theory will work. If the theory seems correct, and yet won't work, it's because something is wrong

The Romance of the Commonplace

Thoughts on the Lovers of Yesterday—Hints for Housekeepers To-day

WHAT has become of the lovers we knew, ten, five, even two years ago?

All old commonplace married folks, you say. Romance all gone—the ecstasy of love all forgotten.

Not mine the genius to portray such fiery youth as one meets in some of the "best sellers" of the past decade, but mine eyes behold, day by day, the living proof that when the day of rose clad Maid and summer Youth are by, love still lingers.

Sometimes I am really sorry for the view of love one gets in the usual love story—the passing madness, for it is portrayed as just that. And the ridiculous things the hero and heroine do! Then, some one says, "Oh there is no real love—not like that described in a story." Thank fortune there isn't! For if there was it certainly would give way, before the wear and tear of everyday life.

The Adventure of the Commonplace

Now, I can see, in many a Susan, bargaining at the grocery counter, not one bereft of the joys of love just because courtship is over, but one still held in the thrall of life's great adventure. One so up-lifted by her joy, that she can bear her share of the burden of "commonplace" yet bear it proudly, like a queen, because it is the tribute Love demands of her. And the woman pushing the baby carriage—Do you think the father of the baby sighs for the sweetheart of other days? No, for you know that when he first heard the child's cry, and knew that she who had brought it through the gates that open on the Valley of the Shadow, was still left—in that solemn hour she became something more than Sweetheart. She was Wife, and Mother—commonplace, but dear.

And then there is Kate, bending over the steaming washtub, with roses in her cheeks, brought there by the heat, no doubt. To Tim, her heated face has a beauty greater than when shrouded in her wedding veil. Those moist drops on her brow have a deeper meaning than the orange blossoms, for those marked her venture on an unknown sea, but these speak loudly of endurance, a love that stands life's hardest test.

Down the Street They Go—

These are the sweethearts of yesterday, sweethearts of to-day, too. As for John, and Howard, and Will—all along the little back streets, and up flights of stairs, and out in the country, are these commonplace folks, and Annie is waiting supper for John, knowing he comes home tired. It is their hour together, and when he comes, there are baby arms that will clasp him around the neck, unashamed of neighbor's eyes, but within the door, the look in his eyes is for Annie. Then they sit together, and watch the other commonplace folks go along—the carpenter, all sweaty, and we know there is the home light shining in his face, then the plasterer, all white with lime, the coal wagon driver, all black and grimy, and we know the home love is glowing in their hearts. Old commonplace married folks? Oh well—

The Lovers want by just now. She was hanging on his arm. He was smoking a cigarette. Her short skirt displayed a liberal length of onion-skin hose. I sighed, but I know they will learn better after awhile.—**LILLIAN DAVIDSON.**

EVER-USEFUL VINEGAR

"Oh, don't throw away the vinegar," exclaimed an experienced housekeeper as her young friend removed the last pickle from the jar.

"But the vinegar isn't strong enough to be used again," the younger one objected.

"No, but turn it into the roaster where you just cooked the meat with the onion dressing and set the roaster where the vinegar will simmer gently for a few minutes. There will not be left the slightest trace of onion when the roaster has been washed."

"Oh, that is worth knowing. We do like onion flavor in many dishes, but

OUR PATTERN SERVICE

No. 1800, the one-piece cover-all apron illustrated in the upper corner, may be slipped over a good frock and will save it from soiling. The comfortable neck opening allows the apron to slip on so easily that the hair is not mussed, and the big pocket is a useful addition.

Do you remember the suggestion made last December, that we plan our gifts for an "apron Christmas"? Everybody likes a pretty apron and it would not be a bad idea to cut out several now from the same or different materials and finish them now for next holiday time.

No. 1800 takes in the 36-inch size only, 3¼ yards of 32-inch material. Patterns come in sizes 36, 38, 40, 42, 44, 46 and 48 inches bust measure. **Price 12c.**

No. 1614, the little girl's dress, is so simple that even an inexperienced young mother can easily make it. The Bertha collar may be embroidered, or be made of a pretty thin organdie or batiste. Or it may be left off altogether. The skirt is gathered on to a yoke, a very becoming effect for a plump youngster.

No. 1614 comes in sizes 1, 2, 3, and 4 years. Size 4 requires 1½ yards of 36-inch material with ¾ yard contrasting. **Price 12c.** Embroidery transfer patterns **No. 626**, in blue only, is 12c. extra.

No. 1798 is a romper play suit and the small boy who is hard on his clothes (and what boy isn't?) will revel in it. So will his mother, who has to wash and iron and mend, if necessary. Made of sturdy galatea, there should be little need for mending.

No. 1798 comes in sizes 2, 4 and 6 years, and for the 4-year size requires 2 yards of 36-inch material. **Price 12c.**

No. 1788, the dress for trips to town, for church, or social, shows a new use of the popular neckerchief idea. Made of silk, with Paisley, batik or figured crepe de chine trimming, it would be very smart indeed. Or you could use a simple, pretty cotton and trim it with flowered voile, eretonne, or, if the material is figured, with voile in a plain color.

No. 1788 cuts in sizes 16 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 3¼ yards 36-inch material, with ¾ yard contrasting. **Price 12c.**

To Order: Write name, address and pattern numbers clearly. Enclose proper remittance and send to Fashion Department, American Agriculturist, 461 Fourth Ave., N. Y. C. And—

Be sure to add 10c. That will bring you the summer catalogue, full of sensible, pretty dress suggestions, designs suitable for every day and dress-up, for camping, staying at home and visiting. Remember, just 10c.

we never like it 'secondhand' in the next food cooked in the same dish."

"It works just as well in removing any objectionable odor such as burned food or a moldy taint."

"To remove labels from any surface wet liberally with warm vinegar; this thins the glue or paste so that the

label is readily removed. A little vinegar added to the dried-up contents of a mucilage bottle will make it again usable.

"A cloth saturated in vinegar and wrapped round a burn will usually offer immediate relief."

"Tin utensils that have become darkened and discolored are greatly improved by being boiled in a solution of vinegar and salt."

"A good homemade silver cleaner costs but little. Have the tinsmith cut a disk of sheet-zinc five or six inches in diameter. Place this disk in the bottom of an enameled-ware pan and on it lay the silver. To a gallon of hot water add about ¼ cup each of salt and vinegar and pour over the silver so as to entirely cover it. In a few minutes remove the silver, rinse in hot water and polish vigorously with a flannel cloth."

"A little vinegar added to tough meat tends to soften the fiber and make it more tender."

"Before papering walls that have been patched with new lime or that have been white-washed, brush with vinegar and the paper will stick and will not discolor."—**ALICE MARGARET ASHTON.**

GETTING RID OF ANTS

A subscriber suggests the following method of exterminating ants. Purchase five cents worth of tartar emetic at the drug store, divide this in two parts; place in two dishes in cupboard, put a teaspoonful of sugar in each dish and cover with water. The ants will eat and then leave.—**P. W., N. Y.**

R. Heart, Phoenix, N. Y., writes that the following method has been found successful in killing ants:

Purchase one pint bisulphate of carbon. In the spring, as soon as the ground is soft, dig holes with a stick about a foot apart all around the house.

A TIP FROM THE "MERE MAN"

THE "mere man" has had a good deal to say about house-keeping recently. He happened to drop in to the household department the other day, and being in a genial mood, contributed a new "recipe." Said he:

"I'm sure it will interest your readers to know that gelatine, colored with red ink and mixed in with timothy hay seed, makes delicious raspberry jam."

We pass it on for what it's worth.

Pour a small quantity into a hole and cover quickly, so that the fumes will penetrate under the surface dirt. This not only kills ants, but also the eggs. Be sure the circle around the house is completed even if it means crawling under the porch to complete it.

Another subscriber writes that she has used peppermint herb, and also tansy, which she puts around the place which the insects infest.

NASTURTIUMS ARE HOMEY

The dwarf nasturtium is one of the most popular farm flowers. The seeds cost so little and grow so well that it is easy to get a fine bed of them anywhere. They are homey little friends that will greet us every morning, no matter how many we cut. They keep on blooming until frost, if kept from forming seeds. They are fragrant, and the colors range from very light yellow to dark mahogany color, with a preponderance of lighter shades.

The dwarf varieties make fine edgings for large beds or hardy borders. The climbing varieties are larger growing and will spread over a square yard or more of space, according to the richness of the soil and the amount of moisture they get. They are not really climbers, but trailers, as ordinarily grown, though they will climb if in very rich soil and having plenty of water. The flowers are larger than those of the dwarf, but not so freely produced.—**RACHAEL RAE.**

Picnic Time is Here!

New Sandwich and Salad Ideas For Hot Weather

IN our community, we have sensibly stopped taking cake, meat, spreads, salad and hot dishes to picnics and socials, and confine themselves to one article of food. Each family takes enough bread and butter for its own use and that, with one extra dish, suffices. Formerly we took home about half of the food mussy and stale, but the war taught us that it is wicked to waste anything.

We have now gone a step farther and specialize in the things we take. For example, my contribution is always a big meat loaf. I get seventy cents worth of round steak and have the butcher grind it. To that I add two large pork chops ground, a cup of rolled cracker crumbs, three well beaten eggs, seasoning and enough sweet milk to hold it all firmly together. This I roast in the oven, taking it hot to the social or picnic when possible. Now it is easy to see that for one dollar, or thereabouts, I could never prepare cake, salad, meat, eggs, baked beans and all the other things I used to stew around getting ready.

Just sit down to calculate some day and see how fair and sensible is the plan. A big frosted cake costs about one dollar, a nice dish of salad with cream in the mayonnaise, nut meats, fish, celery, olives or whatever the ingredients are, can hardly be made for less than that amount, and a big pan of baked beans with nice bacon, and tomato sauce is not a cheap dish. One big dish to each family is a fair proportion and all the ladies play fair. Two dozen deviled eggs may seem small in comparison with a cake, but when eggs are selling at forty cents per dozen and one remembers that it takes cream and salad dressing to mix with the yolk, the cost soon matches the butter and eggs and flour that went into the cake.

Less Work and More Pleasure

Another fine thing about our plan is that the elderly ladies, the women with little children and the overworked housekeepers with many cares, have a chance to enjoy themselves with even less worry and work. One elderly woman buys the coffee, another provides the sugar and cream, another the bananas or other fruit, and so on through the list of things that require little or no preparation. One woman brings the spreads and another the pickles; one always brings noodles cooked with shredded chicken, keeping them hot in a big crock, one provides the hamburger to be fried for sandwiches, which are the choice of the children.

This may sound stingy and calculating, but it is a great saving of woman power, particularly in warm weather. We have better times than we did the old way and even if we know about what will be served it is always good and hot (when hot things are required) and the plates are not filled so full that as much is wasted as is eaten. Nobody wishes to go back to the old plan and that is pretty good proof that it works.—HILDA RICHMOND.

SUMMER SALADS AND SANDWICH FILLINGS

If you wish a somewhat unusual and delicious salad, take a package of prepared lemon gelatin, add to this one pint of boiling water, dissolve all the gelatin mixture and allow to become cool. Just before the gelatin begins to set, stir in one cupful of finely shredded cabbage, and one half cupful of shredded pineapple, also a tablespoonful of chopped or finely cut sweet pimento. Turn the mixture into individual moulds and allow to harden. Or it may be put into a single dish and served by the spoonful. Put a mould or a tablespoonful of hardened prepared gelatin on a lettuce leaf, garnish with mayonnaise and serve cold.

Another appetizing salad may be made from equal parts of finely chopped cooked beets and crisp cabbage. Blend thoroughly and moisten with any preferred salad dressing. To each pint of the salad turn in one half teaspoonful of grated horseradish. Toss with

a fork until well mixed. Pack into a bowl and allow to stand a couple of hours in a cool place before serving.

Delicious sandwiches may be made by taking one part of chopped green tomato or India relish to five parts of cottage cheese. Blend, season to taste with melted butter or a little mayonnaise. Spread between slices of buttered white bread.

Olive butter may be procured by the glass. To each hard-boiled chopped egg, allow three teaspoonfuls of olive butter. Season with a little salt, pepper and a teaspoonful of melted butter. Use as a sandwich filling.—EMMA GARY WALLACE.

A NEW BREAD-BOX

DO you like pretty containers for your kitchen supplies? When I was married I wanted a whole row of them, but the cost was so appalling that I wrapped my bread in a cloth and kept my flour in its dusty sack for months, until I paid a visit to a friend in a nearby town.

She had a lovely blue and white kitchen, but what caught my eye was a shelf a foot from the floor filled with odd-sized beautifully painted cans. First, was a tall flour can, next a square box, evidently for cake, next a squatty bread-box, and then some tall boxes that proved to be cooky cans.

They were shiny white, and each had a little conventional design in blue on the cover, and a border of blue at the bottom of the can.

"Where did you ever get those lovely things?" I asked her. "They look like a million dollars."

"And cost ten cents," my hostess laughed.

"Ten cents!"

"Don't you recognize them? See, this one used to be a big peanut butter can, and this was a cracker box, and this is a can that marshmallows come in. These tall ones I've bought coffee in all my life. I painted them with some enamel that was left from finishing the woodwork in our house. I get the cans from my grocer; he is glad to get rid of them. The ten cents went for a little tube of blue oil paint."

The Store-Keeper Helps Out

It sounded simple, and I stopped at our general store on the trip home. Our merchant was glad to give me a 50-pound lard pail, and a big marshmallow can, both of them emptied that day. He promised that I should have some coffee cans, too, when they were empty. White enamel would never do in my rather colorless kitchen, but out in the workshop I found some black auto enamel that had been left when my husband refinished the Ford.

The next day I started the job. First of course, the cans had to be thoroughly washed and scalded. It took lots of soap and hot water, but it was finally done, and both cans were set over the stove to dry quickly and completely.

I put the covers on tight and then painted all of the surface except the bottom, I was careful to put the enamel on thick enough to cover the letters already on the can. Painting was a very short job, but the cans had to stand over night to dry thoroughly.

In the morning I cut out a spray of pink apple blossoms from some curtain cretonne and I glued a spray on the cover of each can. Then I gave the entire can a good coat of spar varnish also left over from our spring painting. This protected the cretonne and gave a washable surface.

It takes imagination more than money to make a home, doesn't it?—VERA MEACHAM.

Perhaps some other mother finds the children's beds well jumbled when she goes to make them, no matter how well the bedding was tucked in.

I have solved the problem, in a measure at least, by placing an extra sheet crosswise, over the under sheet, and tucking ends well under mattress. This seems to stay in place no matter how much the youngsters move around and the extra washing is hardly noticeable.—PATSY'S WIFE.

Real Economy

LESS than a cent a serving is the usual cost of Post Toasties — crispy, golden-brown flakes of toasted corn. That is economy!

There's no extra cost for the superior quality. Ready to eat with cream or milk, energizing, and with a crispness and flavor that says to every appetite, "Here's happiness."

Be sure you get Post Toasties — distinctive in quality — worth asking for by name.

Post Toasties

-improved corn flakes

Reviewing the Latest Eastern Markets and Prices

LONG ISLAND DUCK GROWERS IN FIGHT

HERSCHEL H. JONES

THE Long Island Duck Growers' Cooperative Association which has done so much to stabilize the marketing of ducks and put the Long Island duck industry on a sound basis, is having its troubles with unfair and unscrupulous competition. The organization has since its inception been fighting to eliminate some of the sharp practices and unsound methods prevailing in the West Washington live poultry market. To accomplish this it finally became necessary for it to refuse to distribute its ducks through certain firms. These firms are now seeking to break the Association by underselling and reckless competition. They are reported to have been buying quantities of ducks at 25 cents per pound and selling them at 23 cents. The worst part of it is that members of the Association itself have aided and abetted them by violating their agreements with the Association to sell through it only and selling to the very men who are trying to break the growers' Association.

The bulk of the live ducks which come from the Association are handled through three firms. The Association places a value on the ducks which seems justified by existing conditions of supply and demand and their prices have been satisfactory to most of the buyers. In fact, buyers generally are very much in sympathy with the growers' Association because of the way it has regulated and stabilized the market. One of the practices which the buyers are in accord with the Association in trying to eliminate is that of forcing buyers to take a quantity of fowls or chickens along with ducks, making a sort of combination sale as the grocers did with sugar and things that they wanted to get rid of during the war.

The competition of the firms that are fighting the Association has created a range of prices instead of a firm quotation and has made it difficult to determine what the market really is in cases where buyers have standing orders or contracts to take so many ducks at the current market quotation.

The Association has during the last week been selling its live ducks at 25 cents, whereas the independent competitors have sold at 23 cents. Dressed Long Island ducks, dry picked, are also selling at 25 cents per pound.

POTATO PROSPECTS

In Southern New Jersey there is this year a small increase in the number of acres planted in potatoes over 1922. Except for lack of rain growing conditions have been generally favorable and there is about 85 per cent of a stand. Due to unseasonably cold weather at planting time the bulk of the crop will be later than usual.

These conditions hold for Monmouth County, Freehold section, where the rainfall has been exceedingly light. Some growers believe that the yield will be reduced to about 60 per cent of normal and even less if the drought continues. At this time the vines should be filling the rows, but with few exceptions there is over 18 inches space and some wilt due to the very hot weather.

The Long Island potato fields seem to have been better favored with rain and if the growers have no bad luck for the next few weeks, there will be a good crop of both Irish Cobblers and Green Mountains. Some growers believe that potatoes from the far Eastern end of the Island will appear in the New York City market in baskets about the last week in July. It will be a week or two later before shipments will be made in carlots.

IN THE TRUCKERS' MARKETS

The Wallabout, Gansevoort and Harlem farmers' markets in New York were fairly well supplied last week with fresh green vegetables from Long Island and other nearby sections. The prices showed some slight advance toward the end of the week and demand was fairly active. The following prices represent sales made by farmers to jobbers and retailers on June 28: ASPARAGUS—per dozen bunches, white and green, prime, best \$2.50 @ \$2.75, fancy \$3 @ \$3.25, culls \$1 @ \$1.25;

BEETS—per bunch, best 6 @ 7c; ordinary 5c; CAULIFLOWER—per slat barrel, best \$3 @ \$3.50, fancy \$3.75 @ \$4, No. 2's \$1.25 @ \$1.50; CARROTS—per bunch best 5 @ 6c, fancy, few sales large stock 7c, ordinary 4c; CABBAGE—per head white best 8c, fancy, few sales 10c, ordinary 6 @ 7c, per slat barrel \$1.75 @ \$2; ONIONS—per bunch best 4 @ 4½c, fancy, few sales 5c, ordinary 3 @ 3½c; RADISHES, per bunch, red and white tip best 3 @ 4c, white radishes 2 @ 4c, black radishes 4 @ 6c; RHUBARB—per bunch 1½ @ 2c, few sales 2¼ @ 2½c; ROMAINE—per crate (32 qts) best \$1 @ \$1.25, ordinary 75c, per slat barrel best \$2 @ \$2.25, fancy \$2.50, ordinary \$1.25 @ \$1.75; SPINACH—per crate (32 qts) Savoy best \$1.50 @ \$1.75, fancy \$2, New Zealand, 75c @ \$1; STRING BEANS—per bushel bag, green best \$2.25 @ \$2.50.

UP-STATE GREEN PEAS MOVING

The first shipment of green peas from Western New York were received in the New York market last week and sold from \$3 to \$3.25 per bu. basket. Madison County supplies are light but steadily increasing. A few small sales

are liberal. The following are quotations on Hudson Valley berries June 28, 1923:

CHERRIES,	Best	Fancy	Ordinary
Black, sweet, qt.	20 @ 22	23 @ 25	18
Red, sweet,	16 @ 18	20	15
White, sweet, qt.	13 @ 15		10 @ 12
Red, sour, qt.	15 @ 16	12 @ 18	12 @ 14
GOOSEBERRIES,			
qt.	18	20	15 @ 16
RASPBERRIES,			
pint	10 @ 12	14 @ 15	8 @ 9
CURRENTS			
Red, qt.	15 @ 16	17 @ 18	12½ @ 14

BUTTER SUPPLIES HEAVIER

Supplies of butter received in the New York market last week were much heavier than previously and the offerings were in excess of the trade demand. Considerable quantities are being put into cold storage by the owners, and large chain stores and jobbers are putting away a considerable supply for their fall and winter needs. The buying for speculative purposes is not very active but is still a factor in determining the market. Wholesale quotations on creamery high score were 39 @ 39½c June 28, compared with 39½ @ 40c a week previous. It is very interesting to note that the price of 39 @ 39½c of June 28 is exactly the same as the quo-

Quotations From Eastern Markets

The following are the prices at which farm products of special interest to eastern farmers sold on June 28:

Eggs, Nearbys (cents per dozen)	New York	Buffalo	Phila.
New Jersey hennerly whites uncandled, extras.	41 @ 42
Other hennerly whites, extras.	38 @ 39
Extra firsts.	32 @ 35	27 @ 28	27½
Firsts.	28 @ 31	24½
Gathered, whites, first to extra firsts.	28 @ 33
Lower grades.	24 @ 27
Hennery browns, extras.	33 @ 35
Gathered browns and mixed colors, extras.	28 @ 32	25 @ 26
Pullets No. 1.	24 @ 28
Butter (cents per pound)			
Creamery (salted) high score.	38½ @ 39½	42 @ 43
Extra (92 score).	38½	40 @ 41	40
State dairy (salted), finest.	38	38 @ 39
Good to prime.	36½ @ 37½	32 @ 37
Hay and Straw, Large Bales (per ton)	U. S. Grades	Old Grade Standards	
Timothy No. 2.	\$22 @ 24	19 @ 20	\$22 @ 23
Timothy No. 3.	19 @ 21	19 @ 20
Timothy Sample.	12 @ 16
Fancy light clover mixed.	21	21 @ 22
Alfalfa, second cutting.	29 @ 30
Oat straw No. 1.	10 @ 12
Live Poultry, Express Lots (cents per lb.)			
Fowls, colored fancy, heavy.	22 @ 23	24 @ 25	24 @ 25
Fowls, leghorns and poor.	18 @ 21	21 @ 23
Broilers, colored fancy.	45 @ 50	45	53 @ 55
Broilers, leghorn.	30 @ 40	35	30 @ 32
Live Stock (cents per pound)			
Calves, good to medium.	9½ @ 10½
Bulls, common to good.	4 @ 4½
Lambs, common to good.	10 @ 14	8 @ 15
Sheep, common to good ewes.	2½ @ 4½
Hogs, Yorkers.	8 @ 8¼	8¼

of fancy peas were made at \$4 per bu. basket, and ordinary sold at \$2.50 to \$2.75 on June 28. Long Island peas were quoted by the State Department of Farms and Markets at \$1.50 to \$3.50 per bu. basket.

Wayne County lettuce also made its first appearance in the market last week. Shipments were of very poor quality and were in light demand at 50 to 75c per crate. Supplies of lettuce from Orange County, Long Island, and other nearby sections were liberal and generally of inferior quality. A few sales of fancy Orange County lettuce went as high as \$1.50 @ \$1.75, and poor as low as 50c.

OSWEGO STRAWBERRIES COMING

First shipments of strawberries from Oswego County and Western New York arrived in the New York market last week to supplement the liberal supplies from the Hudson River Valley. The bulk of the berries were of inferior quality.

Monroe County berries sold at 15 to 20c per qt., best Oswego County 25 @ 30c, Long Island 10 @ 35c, and Hudson Valley at various prices ranging from 10 to 25c, with a few small sales of fancy upper River berries at 28 to 30c. The total strawberry shipments this season to date from New York State sections are about half of what they were up to the same time last year.

Currants, gooseberries, raspberries and cherries are now arriving from Hudson River Valley sections and the supplies of cherries from New Jersey

tation for creamery high score on the same date last year.

Creamery extras (92 score) quoted at 38½c on June 29 were 38 @ 38½c on the same date in 1922.

CHEESE MARKET WEAK

The market on average run fresh State whole milk cheese showed some weakness last week. It is reported that high prices are still being paid up-State, and one sale in the New York market was reported as high as 26½c per lb. Straight cars of fancy State flats were offered in New York last week at 25c, however, an average run could be easily bought at 24. The official trade quotation on State whole milk flats, fresh, average run was 24c. On the same date last year State fresh average run was quoted at 18½ to 19½c. Receipts of cheese at New York last week were 100,000 lbs. in excess of the previous week.

FANCY EGGS HIGHER

With decreasing proportion of really fancy quality eggs in the New York wholesale market last week, prices advanced and the market became increasingly firm. New Jersey hennerly whites, closely selected, extras, were quoted at 41 to 42c per dozen at end of last week. The prospect is for advancing prices on the highest qualities from now on. Only eggs that are exceptionally fresh, of large size, light yolks, and either chalk white or brown shells come in this fancy class. Producers are often tempted in a rising market, as we shall

probably have in the next two months, to hold eggs in anticipation of higher prices. It is a blind policy, for held eggs deteriorate so rapidly in the summer, that by the time they reach the market their quality is so far down that they are thrown into competition with western gathered eggs and storage eggs, of which there is usually an abundant supply.

Receipts of nearby eggs are falling off. There are still some accumulations of ordinary quality nearby whites in hands of dealers, which can only be moved at low prices. Average nearby extras during the week sold at 35 to 38c, with sales mostly at 36c or above at end of week. The bulk of the nearby eggs, however, sold within a range of 25 @ 32c, with a large proportion at around 28c.

ACTIVE DEMAND FOR BROILERS

In spite of a liberal supply of express shipments of broilers last week, the market was firm, due to very active demand. Prices averaged higher than last week by about 2c per lb. The usual pre-holiday demand before July 4th will probably continue Monday of this week, but if heavy receipts come in late, prices are likely to fall off.

Express broilers, colored, sold June 28 at 50c per lb., compared with 42 @ 48c on the same date last year. White leghorn broilers, large, sold at 40 to 42c, average 36 @ 38c, compared with a general range at same time last year of 35 @ 40c. Fancy selected nearby broilers, however, sold easily last week at 52c.

Express fowls sold better toward the end of last week, most of the white leghorns at 22c, and colored stock at 23 @ 24.

LIVE CALVES SLIGHTLY HIGHER

Although there was some fluctuation in supplies and prices on live veal calves at New York last week, prices were slightly higher toward the end of week, than previous week. Most veals ranged from \$8 to \$12.50 per cwt, with \$12 as the top late in the week. Following were prices on calves June 28, per cwt: prime, \$11 @ \$12; good to medium \$9.50 @ \$10.50; common \$8 @ \$9; culls \$6 @ \$7; buttermilks \$5 @ \$5.50.

Country dressed veals arrived mostly in bad condition and many were condemned by Health Department. Choice dressed veals were scarce and sold at 15 to 16c per lb.

HAY MARKET WEAK

With liberal receipts of poor quality hay, the New York market became very weak last week. Trading was extremely quiet. Boat shipments added to supplies by rail. Large bales sold much more readily than small. U. S. Timothy No. 1 of which there was practically none on the market was quoted at \$25 per ton. Rye straw was overplentiful and hard to sell at \$22 per ton.

Give a thought to Advertising

HAVE you seen our "Hired Man" anywhere?

He's traveling all over the State, visiting retail dealers wherever he goes.

A fine fellow is our "Hired Man." You want to get acquainted with him at your first opportunity. For in a way he's your hired man, too. Anyway he's working for you at the same time he's working for us. You'll recognize him easily when you meet. He's a neat two-page booklet—just the size of the *American Agriculturist*, only not so fat. Every now and then we send him to nearly every storekeeper and retail dealer in the State.

The "Hired Man"—that's the name of this booklet, has quite an interesting job—a nice friendly job. He tells everyone he meets why it's a good idea to sell the products that are advertised in the *American Agriculturist*. And he has a mighty good reason for doing so.

In the first place, he knows that every reader of the *American Agriculturist*—and that's nearly every wide-awake farmer in the State—has absolute confidence in the *American Agriculturist*, what it stands for and those products it advertises. For of course they know that the *American Agriculturist* stands in back of each and every advertisement it carries. No cheats in its pages. So naturally *American Agriculturist* readers buy the things they see advertised in their favorite magazine. Every storekeeper and retailer is quick to see how he will benefit by stocking these products—they're what his customers will want. It's in this way that the "Hired Man" works for us and for our advertisers.

A pretty good and useful job that the "Hired Man" has, don't you think? He's just one of the many branches of advertising. It certainly is surprising the number of different things that enter into the advertising business. And the number grows every day.

So now when you think of advertising, think of the "Hired Man," and next chance you get, meet him at your favorite store—just ask the storekeeper to let you see him for a minute.

Long News Made Short

Port Authority Opposes Central Railroad Merger

FOR several years a government organization known as "The Port of New York Authority" has been working on plans to provide better terminal facilities in the great metropolitan district, and thereby greatly lessen the cost of getting farmers' products to city consumers. The New York Central Railroad has announced a plan for merging with the Central Railroad of New Jersey, as one way of lessening transportation costs to the cities. But the Port Authority objects to this merger and a fight is on between New York Central and the Port Authority, before the Interstate Commerce Commission to prevent the merging of the two railroads.

The Port Authority claims that the Central's plans will not solve the problem, but will complicate or prevent the Port Authority's plans for better terminals.

In the extended trip which President Harding is taking through the West, he has had much to say about the farming situation. In one of his speeches in particular, he called attention to the large number of acts which the recent Congress passed to help the farmer with his credit and marketing troubles. In an editorial commenting upon the President's remarks, a New York City newspaper said: "Agriculture bore the brunt of the sharp economic readjustment which followed peace. It suffered undeservedly, yet perhaps more or less unavoidably. But it has won the respect and the good will of the whole country by the manliness with which it met misfortune. A new day for the farmer is coming and the best thing about it is, that it is coming through the cooperation of all the other elements in the community which now see that a prosperous, modernized agricultural industry is of advantage to all, contributing to great national efficiency and prosperity."

* * *

Mr. Bernard M. Baruch has caused considerable newspaper comment lately by his recent suggestion that the grain farmers should meet their marketing problems, by purchasing a going concern like the Armour Grain Company of Chicago.

"Think what this would do," said Mr. Baruch. "The farmer would have a practical organization under his own control with practical men doing what needs to be done."

* * *

The Governors of all the States in the Union have been invited to attend the World's Dairy Congress which opens at Washington, D. C., on October 2, adjourns to Philadelphia, Pennsylvania, for October 4, and then goes to Syracuse, New York, from October 5 to 10, to combine with the National Dairy Show for the greatest meeting of the dairy interests that the world has ever seen. A large number of official delegates, representing every part of the dairy industry, is expected to attend the Show from every State.

A book entitled "Cooperative Marketing," written by Herman Steen and published by Doubleday, Page and Company of New York City, is just off the press. This book is the first in a series put out and recommended by the American Farm Bureau Federation.

It gives a rather complete summary and history of the different cooperative movements that have developed in recent years in this country. There is a chapter on cooperative tobacco marketing entitled "From Night-riding to Cooperation." Several chapters deal with the wonderful cooperative movements of the Pacific Coast; another entitled "Everybody's Apples Are Best" gives a particularly interesting history of the apple marketing movement and its difficulties. The chapter entitled the "Milky Way" will be of special interest to dairymen.

The book is well and interestingly written, and is worth reading by every farmer.

A very interesting and very valuable bulletin entitled "Concrete in Home Sanitation," is published by the Portland Cement Association, 111 West

Washington Street, Chicago. The booklet contains complete drawings, pictures and instructions for building many different conveniences needed on the farm and in the home. It will be furnished free upon application.

Apple Growing Advancing

(Continued from page 7)

ber of work horses ranged from three to six.

The largest group of farms, (they averaged 96 acres each) employed one hired man. This allotted 48 acres to each unit of labor, counting the owner as a laborer, and figuring on the total acreage rather than the crop acreage.

The following table shows the amount of hired help employed on farms on varying sizes:

Size of Farm	No. of Helpers	Acreage Per Worker
96 Acres.....	1	48
132 ".....	2	44
177 ".....	3	44
186 ".....	4	37

The same general decrease in number of acres handled per unit of workers was revealed in a study of the extra labor employed at harvest.

On 142 farms, coming under the survey, the wife helped with some of the farm work, and on 67 farms, the daughters also helped.

The Brown Mouse

(Continued from page 11)

in an unsuspected way with the theory."

"The school board are against it."

"The school board elected me after listening to an explanation of my theories as to the new sort of rural school in which I believe. I assume that they commissioned me to carry out my ideas."

"Oh, Jim!" cried Jennie. That's sophistry! They all voted for you so you wouldn't be without support. Each wanted you to have just one vote. Nobody wanted you elected. They were all surprised. You know that!"

"They stood by and saw the contract signed," said Jim, "and—yes, Jennie, I am dealing in sophistry! I got the school by a sort of shell-game, which the board worked on themselves. But that doesn't prove that the district is against me. I believe the people are for me, now, Jennie. I really do!"

"As an officer," she said rather grandly, "my relations with the district are with the school board on the one hand, and with your competency as a teacher on the other."

"Has it come to that?" asked Jim. "Well, I have rather expected it."

His tone was weary. The Lincolnian droop in his great, sad, mournful mouth accentuated the resemblance to the martyr president. Possibly his feelings were not entirely different from those experienced by Lincoln at some crisis of doubt, misunderstanding and depression.

"If you can't change your methods," said Jennie, "I suggest that you resign."

"Do you think," said Jim, "that changing my methods would appease the men who feel that they are made laughing-stocks by having elected me?"

Jennie was silent; for she knew that the school board meant to pursue their policy of getting rid of the accidental incumbent regardless of his methods.

"They would never call off their dogs," said Jim.

"But your methods would make a great difference with my decision," said Jennie.

"Are you to be called upon to decide?" asked Jim.

"A formal complaint against you for incompetency," she replied, "has been lodged in my office, signed by the three directors. I shall be obliged to take notice of it."

The Up-to-Date Farmer is also an Up-to-Date Business Man

THE farmer who writes his letters on the Underwood Portable stamps himself as an alert, progressive, up-to-date business man. Just as important, he saves his own time and energy.

It takes surprisingly little practice for any man or woman to write rapidly and neatly on the Underwood Portable. This compact, handy little machine is specially designed and built for home use—use by people who never studied typewriting or went to business school. Into its

sturdy construction go all the experience and skill of the makers of the world's Standard Typewriter.

The Underwood Portable not only writes letters, but is a great help when it comes to making out orders, reports, tax returns, and all the other records that are a part of farm management today. Underwood typewriting is compact, readable and permanent. And it's useful to have carbon copies of everything you have written.

"Going To Law"

The Farmer's Greatest Problem

He Knows How to Raise Food But His Difficulty Is to Sell It—A Radio Message

By NATHAN STRAUS, JR.

Chairman of the Agricultural Committee, New York State Senate

THE first need of man is food. The production of foodstuffs on the farm intimately concerns the life of every man and woman in the city who consumes food, but does not produce it. A general strike in the steel industry, or the clothing industry, or the coal industry, may result in severe discomfort for certain classes of the population. But failure of all the crops in one year—as a result of a general strike on the part of all the farmers, for instance—would result in starvation for a large portion of the population. Until science learns how to convert earth into apples and the grasses of the field into meat, man will be dependent on agriculture and animal husbandry for his food.

My own work at the side of my father in behalf of a purer milk supply for the city babies has impressed me with the dependency of the city-dweller on farming, and dairying. For that reason I made a request unusual for a city man, when I was elected to the State Senate three years ago. It was that I be appointed a member of the Committee on Agriculture. And when reelected last year, I asked for and received the appointment as chairman of that committee. Three years of study of agricultural problems, following on eighteen years of practical work with the milk question, has convinced me that the terrors of crop failure which threatened the farmer twenty-five years ago have largely been overcome. Agricultural research has made it possible for almost any farmer with average mental and physical equipment to grow a crop, which should give him a fair annual return for his labor and his capital invested. But larger crops on the farm have not resulted in increased prosperity for the farmer. The average farmer's reward for his long hours of work and his risk was in 1919, a banner year, \$1,456. It was only \$465 in 1920. It was \$1,211 in 1922. Why does the farmer still struggle along earning a bare livelihood with crops that should net him a greatly increased income? Because improvements in marketing methods have not kept pace with improved farming methods. Scientific agriculture has solved the problem of an adequate production of foodstuffs. It is time more consideration were given to the farmer's greatest problem to-day—the problem of marketing. I regard a solution of the difficulties of distribution of foodstuffs from farm to city as the greatest service that could be done to civilized man to-day next to a solution of international problems that would bring about world peace.

The farmer in New York receives \$3 a barrel for his apples; the housewife pays 3c and 5c apiece, which is equivalent to \$15 to \$25 a barrel. The dairy farmer receives 4c to 5c a quart for milk; the housewife pays 14c to 18c a quart. This spread between producer and consumer must be reduced if improved farming conditions are to be reflected in increased prosperity for the farmer.

In an effort to contribute toward solving this problem I introduced at the last session of the Legislature a resolution for a committee to study means of carrying the milk, eggs, apples and other farm produce of this State to the city markets by a more direct and economical marketing method. The committee was endorsed by the New York State Grange, the New York State Farm Bureau Federation, the State College of Agriculture

at Cornell University, the Dairymen's League, etc. It was also endorsed by many representative consumer organizations in the city. The resolution unanimously passed the State Senate, but it failed of passage in the Assembly.

Every farmer should know the simple facts on which our committee would have based its study. Every farmer, every city-dweller, should ponder these facts in an effort to contribute toward a solution.

1. New York State is first among the States of the Union in its production of apples, second in its production of milk and milk products, fourth in its production of potatoes.

2. Apples sell in the markets of New York

Market Information Fundamental

YOU will like this sensible talk by Mr. Straus. The talk was broadcast from station WEAJ on Wednesday evening, July 11, at 6:50 P. M., eastern standard time. At this time every Wednesday evening tune on WEAJ, wave length 492 meters, to hear the best farm speakers that can be obtained in the United States, on the American Agriculturist farm radio program.

Every one is now agreed that the big need of agriculture is to sell farm products for better prices. As Mr. Straus so well suggests, this will have to be done mainly through the energy of farmers themselves.

The first step in doing this is to get correct information about the markets. Because this information is fundamental, American Agriculturist is making a constant and special effort through articles, through our weekly market page, and through our radio market service to give our folks this information in the latest and most accurate form.—The Editors.

City at 5c apiece and more every fall, while tons of apples are rotting on the ground within a twelve-hour rail journey of the city because it does not pay the grower to pick, pack and ship them to the city. Last year, as a result of competitive dumping by farmers, the price for potatoes was brought down so low that it is estimated that 70,000,000 bushels were never dug.

3. The people of New York State have spent over \$150,000,000.00 on a barge canal. This canal runs from the apple-producing and milk-producing centers in the west of the State to New York City. It is the connecting link between the Middle West, the greatest zone of agricultural production in the world, and the Atlantic seaboard, the greatest zone of consumption and export in the world.

4. New York State, after building the canal, is making no substantial effort to utilize it for the transportation of foodstuffs. There are to-day less than 300 modern serviceable boats on this canal. Although the 1923 Legislature has been generous in appropriations to assist agriculture, the State to-day spends less than 4 per cent of its annual appropriations for the benefit of agriculture, while other successful farming States such as Iowa, Montana, Kansas, Oregon and Minnesota, spend from 8½ per cent to 18 per cent to help agriculture.

5. Nowhere else in the United States does invested money produce so little or labor bring so small a reward as on the farm. Half the farmers of the country made less than \$1,000.00 in 1922.

6. The actual loss in farm population caused by migration from the farms to the cities is at the rate of over half a million persons per year.

7. While some other States are solving the

farmers' marketing problems by encouraging cooperative marketing and by the extension of State assistance, New York, one of the greatest agricultural States in the Union, is doing practically nothing to reduce the spread between prices on the farm and food prices in the city.

The same energy that solved the problems of the production of foodstuffs will solve the problems of marketing. The city-dweller with his need of cheap foodstuffs in the city has as much interest in the solution of these problems as has the man on the farm. State aid must be extended for a study of marketing conditions, for legislation to promote cooperative marketing, and indeed for public markets in the cities with adequate warehousing and cold-storage facilities. Lasting gratitude is due men like Dean Mann of Cornell, Judge John D. Miller of the Dairymen's League, H. E. Babcock of the New York State Cooperative Council, Aaron Sapiro, organizer of successful farmers' cooperatives, and Senator Royal S. Copeland, for for their work toward solving the marketing question. But back of the efforts of such men, back of State aid, the mainspring and the driving force of the movement to bring the producer on the farm and the housewife in the city in closer touch must be the energy of the farmers themselves. The solution of their marketing problems can come only from their united effort, backed up by their will to do it.

"Tune In"

You do not have to have a radio to get the benefit of the great marketing service which is being furnished daily by American Agriculturist, the New York State Department of Farms and Markets and the WEAJ broadcasting station. In nearly every community there is now at least one radio receiving set. If you want the money these reports will save you, you will find some way to cooperate with your neighbor who has a radio to receive these reports.

A little community marketing club might be formed, or some local farm organization already formed might be used to subscribe a small sum to pay the lady of the house who has the radio to telephone the market reports to each member of the club as soon as they are received every morning. Or perhaps arrangements can be made to have them posted in some conspicuous place like the local grocery store or the weekly newspaper office, or at the station where the milk is delivered. Best of all, an inexpensive radio set might be built at home to get the reports direct.

These reports are last minute prices and information selected from New York City, the greatest market in the world, by the experts in the New York State Department of Farms and Markets. They are broadcast at 10:50 A. M., eastern standard time, from WEAJ, wave length 492 meters, every Tuesday, Wednesday, Thursday and Friday. Blanks for taking down these reports as they come over the radio will be furnished free of charge upon application to American Agriculturist, 461 4th Avenue, New York City. "Tune in."

The American Agriculturist is the best magazine for general information that I ever read.—Arthur A. Glunt, Lilly, Pa.

"Going To Law"

Humorous, But Worthwhile Advice Written Long Ago, Still Good To-day

HAPPENING into the office of a county judge recently to have some documents made out for the transfer of a piece of property, we overheard part of the details of a case something like this: Two men, whom we recognized as poor day laborers, were having papers drawn up for carrying a suit to a higher court, where the expenses, which were to be secured in advance, would amount to about a hundred dollars. As near as we could learn, one of the parties had agreed to purchase a cow of the other, for thirty dollars, but before her actual transfer she died. Each man had already expended about fifty dollars, in court and counsel fees, expenses of witnesses, etc., and now they were preparing to continue the contest, at an expense equivalent to what they could earn in six months' labor.

This incident forcibly reminded us of a *plaster cast* we saw offered a few years since by one of the peripatetic vendors of this kind of wares. Two sturdy yeomen were represented as contending for the possession of a cow. A legal counsellor had been employed by one of the parties, who, dressed in the wig of olden style, was seated upon a pile of law-books, quietly drawing the milk (his fees) while the contest went on. The accompanying engraving is an accurate sketch of the piece referred to. The only fault we would find with the picture, is that the counsel of the other party should be shown upon the other side of the animal, drawing an equitable share of the milk—the two legal gentlemen on friendly terms of course. (We throw out this hint for the benefit of manufacturers of plaster casts, marble, terra-cotta, etc. Any one carrying out the idea may send us the first perfect specimen with a bill therefore.)

This picture admirably portrays the character of three-fourths of all the law-suits carried on in the country. So long as the cow gives milk, it will be required for "expenses," and when this fails, the worthless carcass of the animal may perhaps be obtained by the litigant who has the most physical endurance, each of them having in the meantime sacrificed the entire use of the cow, and, besides, time and strength enough to have acquired half a dozen better animals.

With most men, the first impulse, on having a slight difference with a neighbor, is, to "go to law about it." To submit the case quietly to the arbitration of disinterested

persons, and yield to their decision, would not quite satisfy the dignity, nay, the belligerent propensity of the parties. How few men, comparatively, there are, who have lived forty years without having "been in court" one or more times. And how few are the instances where even the victorious party has not lost more than has been gained—in time, worry of mind, expenses—

which could bring the most persons on the stand as witnesses, and so with more than twenty other persons we danced attendance. The whole amount at issue was less than our individual loss of time in one of the days spent at court. We received in return one shilling (12½ cents!) *in advance*. (All the further satisfaction we shall ever get, will be the pleasure of sending a copy of the

above picture to the party by whom we were summoned "to be, and appear, etc." We wish he could have had it long ago—before the occurrence alluded to.)

We suggest that this picture be cut out and framed, and hung up in every household, and that whenever a disposition is felt to go into law with a neighbor the lesson it teaches, be first carefully pondered.

There is no doubt that most persons who would first sit down and count the cost of a suit at law, would be deterred from entering into litigation, but for a feeling of false dignity. "I would expend the last cent before I would allow him to trample on

my rights," is the common expression. A story current in our boyhood will illustrate this. Two Dutchmen came into court about a dog that had been killed, and the following scene occurred:

Judge (to the defendant)—"Did you kill the plaintiff's dog?"

Defendant—"To pe shure I kilt his tok, but he must prove it."

Judge (to plaintiff)—"How much was your dog worth?"

Plaintiff—"To pe shure te tok was wort notting, but since he'sh been so mean ash to kilt him I shall compel him to pay te full value."

We recently heard of a case at the South, worth relating in illustration. A whip was borrowed, and on being returned, the lender declared that seven inches had been worn off from the end of the lash. High words ensued, leading to a quarrel, which was carried into court, and from one court to another, with the usual delays, until the aggregate costs to the parties actually amounted to seven thousand dollars—a thousand dollars an inch for the worn lash, without reckoning time, trouble, and the bad feelings engendered.

In another instance a long legal contest ensued, the original cause of which was a slight trespass by a calf. The case ended by a compromise, each party paying his own costs; the total amount of these had run

(Continued on page 25)

Human Nature Again

THE article and picture on this page were taken from an issue of *American Agriculturist* published in 1859—sixty-four years ago, and two years before the beginning of the great Civil War. The picture is an exact reproduction of the old wood cut, but we have enlarged somewhat the size of the type in the article. The hand which wrote the article, probably that of the editor, has been dust these many years, but his humorous words of advice about "Going to Law" apply equally well to-day.

The picture and article on road mending which we recently copied from an issue of *American Agriculturist* more than a half century old, aroused so much interest and comment that we are here passing on another one to you. Those who read these articles and laughed at the pictures when they were first printed, have ceased to worry about road mending, taking the law to their neighbor, or making a living. But although the times have changed, we still struggle with the same problems, because the "human nature" with which the fathers contended is still rampant in the sons, constantly interfering with human progress and happiness.—The Editors.

to say nothing of the trouble entailed upon others who have been drawn into the conflict as witnesses, interested spectators, jurymen, etc. We have a vivid recollection of being called from pressing business to go fifteen miles to attend "county court," and of waiting four whole days to give evidence as a witness, in a case of which we personally knew nothing; and to cap the climax, the

"... if any of our readers are now, or hereafter, tempted to indulge in 'law,' let them first give this picture a careful study. . ."

case was "adjourned over" three months, when two days more were consumed in waiting. Our protestations that we knew nothing of importance, and that all we did know was hearsay, amounted to nothing with those in eager fray. The idea seemed to be that that side would be the strongest

Conditions in 1859

DO not miss that fine old humorous article copied on the feature page of this issue from American Agriculturist, published in 1859. We are not sure who wrote it, probably it was the editor, but he certainly could handle English. Note the word "peripatetic" in the second paragraph. It is big enough to choke a cow. How many of you know what it means? Do you think a larger proportion of American Agriculturist readers knew the meaning of this and other unusual words in 1859, than our readers do to-day? Incidentally, "peripatetic" means walking.

Speaking of cows, note that the price of cows was about thirty dollars. The pay for a day's attendance at court was one shilling. These prices went up for a time, following the Civil War, and then they came down again and stayed down for many years. These prices will not seem strange to most of you because it is but a few years since one could buy a whole dairy for twenty-five or thirty dollars a cow, and when the pay for a good strong boy to hoe potatoes for a straight ten hours was but fifty cents a day.

Varying Butterfat Tests

ONE of the greatest causes of trouble between dairymen and milk dealers is over the butterfat test. Farmers cannot understand why the same herd having the same feed will vary sometimes from two to five points from the test of the previous month. Without question there has been and is some dishonest testing, but it is also true that there is less of it than most farmers believe.

A majority of the dealers doing business at the same stand and with the same patrons year after year, know that honesty is the best policy and try to give a square test. With the small minority of buyers who juggle the test, the remedy lies in having the State Colleges of the State Agricultural Departments check the samples. Or best of all, buy a tester yourself or join a cow testing association. Those in the cow testing associations have the least trouble with their butterfat test. One reason is that the dealer

knows that the farmer knows what his test is every day and therefore he cannot cheat on the test and get away with it. Another reason why dairymen who test have less trouble with the dealers, is that the farmer finds out, for reasons sometimes hard to explain, that the test of the individual cow and of the whole dairy does vary considerably from day to day and from month to month.

For instance, there is a record of a dairy where a heavy thunder shower at one evening's milking, greatly reduced the butterfat test. There is reported by the Ohio State College another case where a cow was milked half by a machine milker and half by hand. The amount of milk greatly decreased, while the test rose from 3.2 per cent butterfat to 4.2 per cent. In another case, some unknown cause made a cow decrease her flow to half of its usual amount and her test decreased also to one-half her average test. At the evening milking, both flow and butterfat test came up to normal again.

Those who are doing constant testing either themselves or through cow testing associations, know that these unreasonable variations in the butterfat tests do occur, and they are not quite so quick to accuse the dealer of dishonesty. When they do accuse him, they have the evidence to back them up. There are many reasons why the ownership and use of a Babcock tester or a membership in a cow testing association is one of the best investments a dairyman can make.

Reading in the Old Days

A FRIEND from down Maine way, talking to us a while ago about what farm people read, said that back on the home farm fifty years ago his father took only two papers; one of them was a religious weekly and the other was the American Agriculturist. "But," he continued, "how those two papers were read. Every word of every article and every advertisement from the beginning to the end of the paper was carefully read, often out loud, and the pictures were studied and discussed. Many times when the articles had a special appeal they were laid aside for reference and for further reading."

Abraham Lincoln is perhaps typical of the people in the old days who had few books, but those books were classics and folks read them so thoroughly that they became well educated. In our own boyhood days in a country neighborhood, we remember several men of the older generation who were not only well informed as to current affairs, but who could also discuss intelligently many of the old classics even to the extent of quoting them extensively from memory. Unhappy was the man who attempted to argue with one of these old boys in history, literature, religion or politics, who did not have his own facts at his tongue's end. In spite of the fact that we of this generation have one hundred times as much reading now as our grandfathers had, we doubt if we are on the average any better informed. Is it because we have so much that we read little of it well or are we better informed on a much wider range of subjects?

He Broke Even

ONE of the things that is doing a lot for our country boys and girls is the junior project work. It is surprising what a different feeling toward the farm work it gives boys and girls to own an animal or animals, or a crop, and to be personally responsible for their success. This is what the junior project work does. The boys and girls learn in school how to raise the animal or the crop in a scientific way and they set their theories immediately into practice on the home farm. They are obliged to keep a very careful record of all their work and all their

expenses so that they know at the end of the season whether or not their project paid.

The story is told of a boy who lived in the State of Maine who took considerable interest and pleasure in raising a pig as his project for the season. In writing up his report to his instructor, he said that if he were obliged to figure in all of the time he spent with the pig, his ledger would show that he lost \$1.57 on the project. But if he took into consideration that he had the company of the pig, why he broke about even.

Which Are Your "Boarder" Crops?

IN a trip through several agricultural counties, we had occasion to ask farmers to give us cost figures on certain crops. With one or two exceptions, these farmers did not know and, as a matter of fact, very few farmers do know anything definite about the cost of growing and keeping animals or farm crops. About all that most of them are sure of is that the profits on the business as a whole are generally few and far between.

Cost accounts might show that what profits there are, come from comparatively few crops or animals, and that these few are carrying a number of other dead-heads; but without definite figures, such as are kept in all other business, few of us really know which parts of the business are profitable and which unprofitable.

A recent letter from a farmer expresses this situation so well that we think it worth repeating here. He says: "I believe that no greater service could be rendered the American farmers than that some power or influence could induce them to keep a simple account of their main enterprises, taking chiefly account of their cash cost and the amount of labor put into them during the year as compared with the other enterprises they are carrying on. For I believe that they would soon discover that if they cut out just about 50 per cent of their enterprises and devoted but a little more attention and thoroughness to the remaining ones there would be less complaining of the 14 and 16 hour day with no vacation for relaxation or recreation. I believe that at the end of the year they would find that with less work and less worry they had made more money, and also had had time to produce a greater proportion of a better living from their own farm. I believe that if the farmers could be induced to keep some such check every time they plunged into a new enterprise that they would soon quit plunging into unfamiliar farm practices and would be more inclined to take a little time off occasionally and learn to live.

"This problem is the same as that of the boarder cow. The few enterprises that make a profit on the farm must carry the farm and help support others that have never paid a profit and yet have robbed the farmer of his time and energy. I believe this problem is of equal importance with the problem of stronger cooperation. If the two can be developed side by side the position of the American farmer is secure and his future prospects not unattractive. The falsity of diversity in an age of specialization persists in keeping many farmers largely engaged in unprofitable activities."

There are probably two main reasons why farmers do not keep books. One of them is that it is very difficult to keep accurate cost accounts on the many different varieties of farm business; and the other is, that farmers are so tired and sleepy when they come in from a day's work they are in no shape mentally to wrestle with bookkeeping. But we maintain that the job should never be done in the evening, and that it is important enough to take time during the day to do it—so important in fact that the time used would prove to be the most profitable of any work done in the whole farm operation.

A July Story

By E. R. EASTMAN

UNCLE Sam Farmer and Young Sam were riding up the long dug road saying nothing, but each keeping up a dickens of a thinking. Relations were somewhat strained. The argument was ages old. Conservative and stubborn ideas of the older generation were again in conflict with the progressive but none-the-less stubborn beliefs of the younger. Such conflicts of emphatic opinion have been waged since Adam quarreled with his sons over the number and kind of goats that should be kept on the first farm; and such debates will still be warmly argued as long as the old and young work together, for to most of those beyond the half century mark, youngsters in their twenties are mere children intolerant of wisdom, which comes with the experience of years, and filled with fool ideas which are both impractical and impossible.

With the big haying ahead on the home farm, Sam had taken a lot of clover to cut on shares for neighbor Barrett. It was three miles up a mountain dug road and back through a piece of timber. The land was new and covered with cobblestones and stumps, so that all the mowing and raking had to be done by hand.

Now Young Sam knew that clover hay was good for cows, but the trouble was he also knew that the kind of cows that Old Sam kept were not good for the clover hay. If the hay could only be sold and a little actual cash realized from it, Young Sam would not have objected to doing a double haying. But he was tired and sick of the everlasting treadmill of working for nothing per hour for the privilege of being "chief cook and bottle washer" for a lot of worthless cows. For years now he had urged Old Sam to get rid of the boarders and put in pure breds, or at least good grades; but the old man thought it just another fool idea of the younger generation and nothing was done. Meanwhile, they continued to work early and late to get stuff enough to feed them.

Then, to cap the climax, Sam went out and took this clover to cut. That was the last straw. The quarrel this time had been long and bitter and had ended in a statement from Young Sam, that when haying was done he was going to leave the farm.

So now they were on the way after their first load up the mountain road to the clover lot where for two days some hired day help had supposedly been busy cutting the clover with scythes. After coming out of the old wood road they stopped at the edge of

the clearing where, stretched away in front of them, was a beautiful sight not often seen by farmers of this generation. Forty or fifty acres of newly cleared land were covered with clover in bloom, standing, in places where it had not lodged, at least three feet high. How it would change the status of farming on these old eastern hill lands if it were possible to get stands of clover, which the pioneers obtained with little effort on the newly cleared fallows! An occasional good farmer demonstrates that clover can still be grown on the eastern hills, by applying large quanti-

"For We've Had Some Pleasant Days, Working the Fields Together"

ties of lime and acid phosphate, but it is an expensive process, and for the most part the devil's paint brush and the daisies hold sway.

As father and son stood at the edge of the clearing looking across the great clover field, breathing the soft summer breeze heavily laden with its scent, and listening to the hum of a million bees at work on the blossoms, they began to lose their grouch. There is something about association with the power and lavishness of nature's summertime that cleanses men's spirits and sweetens their souls in spite of themselves.

Down in one corner of the lot was an acre or so of the clover which the men had already cut. It lay so thick in the swaths that any raking was neither necessary nor possible, for it could be pitched handily directly from the mown swaths to the wagon. Where some of the clover had been cut, three hand scythes hung on a stump, but the men that Sam had hired to wield them were not in sight.

"The boys must have gone down to the spring to get a drink. I don't see them," said Sam.

"Seems to me," said Young Sam, "that goin' to get a drink has taken considerable of their time in the last two days, for there is mighty little clover to show for three men's work."

Just then, up across the field, from an old shelter shed on the edge of the woods, came the sound of boisterous

laughter followed by a song that went something like this:

Oh, when I die don't bury me at all,
Just pickle my bones in alcohol;
Put a bottle of booze at my head and feet,
And then I know I'll surely keep.

Sam stood listening for a minute with a funny expression, showing under the broad brim of his old straw hat, and then down across the lot he went, and entered the shed where he found his hired help having a glorious time, but somewhat the worse for wear from too close association with a keg of hard cider, which they had somehow managed to bring in through the woods.

As the men looked up and saw Sam standing in the doorway, the hilarity came to a sudden end. Sam was usually soft spoken and slow to anger, but there had been much of late to try his patience, and he had reached his limit. He took one look at the scenes of festivity and then, grabbing the handle of a broken rake, he went into action. Young Sam heard a noise like a six-gun battery opening a battle, and then he saw Old Sam's erstwhile hired help break forth from the door of the shanty and point

a wild but somewhat crooked course for the shelter of the nearby woods. Close behind them followed the old man, every once in a while coming near enough to the unfortunate man in the rear to accelerate his speed by a vigorous application of the rake handle.

Then, with head erect, shoulders back, and old knees stepping high, Sam came back across the lot to the wagon and without a word proceeded to put on a load of clover which Young Sam loaded. When it was finished, they carefully bound it with a binding pole and started down through the woods toward home. The road was narrow and on each side it was swampy. They had not gone far when Young Sam drove a little too close to the edge so that the wheels went off on one side and sank to the axle, while the load slowly, but none-the-less surely, rolled majestically over, pitching both men into the bordering briars and bushes.

Father and son sorted themselves out of the brush and immediately began to glare at each other while each tried to get his breath, and think of something strong enough to say that would relieve his feelings and cover the situation. Finally, the little fine lines about the old man's eyes began to crinkle into a smile.

"Samuel," he said, "don't say a word. I been a-thinkin' since yesterday when you told me you were going to leave me, after you had stayed here for years

(Continued on page 22)

Own This Modern Light-Draft Spreader

IF THE MAN without a spreader knew how he could increase the crop returns from every ton of manure by using a **McCormick-Deering Manure Spreader**, he would change his method mighty soon. It isn't a matter of what the other fellow is doing—it is a plain dollars and cents proposition. If you waste your time at uneven spreading you lose profits that should belong to you.

The McCormick-Deering spreader performs two important operations. First, it shreds the manure—tears it to pieces as it passes through the two steel beaters and the spiral wide-spread device; second, it spreads evenly and uniformly, in any quantity desired.

Among the features of the McCormick-Deering spreader are: An auto-steer which permits the spreader to be turned in close quarters, and which eliminates neck weight; adjustment for six feed speeds; and the all-steel frame with all appliances bolted to it direct.

Ask the McCormick-Deering Dealer to point out these features.

The Keyport Section

A Noted Vegetable Garden District of New Jersey

CENTERING about Keyport, and extending for some ten miles between South Amboy and Matawan on the north and Middletown on the south, is a busy garden district. Methods are not especially intensive, and crops are grown in fairly large fields. The leading products are asparagus—chiefly white or blanched “grass”—tomatoes, peppers, eggplants, sweet corn, and muskmelons. Grapes, small fruits, and tree fruits are also generally grown. Fifteen years ago most of the growers drove to the boat at Keyport and loaded their produce to reach market around midnight. Now there is no regular service, and the five-ton truck has eliminated two handlings and two carriers, for it takes the load from farm to commission house or market without change. These huge seagoing trucks make an impressive sight as they charge up the Jersey highways in the late afternoon or early evening with their load of food for the millions of the metropolis. Yes, they are seagoing craft, for they cross the bay from Staten Island to Manhattan. The

By PAUL WORK

Root crops planted late will yield a product of higher quality for storage than when the plants have borne the brunt of the hot dry season. The beets and carrots so matured are of finer texture and more delicate flavor, as well as fresher and more attractive in appearance.

PAUL WORK

It is difficult to correctly time the planting of late crops, and dry weather renders germination uncertain. The probability of securing a prompt and even stand is greatly increased through special care in sowing. The drills may be made rather deep, and yet covering may be light enough to permit a ready come-up. The contact between seed and soil is improved by firmly compacting the soil over the seeds. Of course irrigation is of inestimable value in this connection.

The Wage Problem

Gardeners have complained bitterly of labor conditions this season, and not without reason. Nassau County growers are paying as high as \$6 a day for men and \$3.50 for women. Fortunately, market prices during the early summer have been fairly good. Otherwise

Intercropping with Tomatoes to Pay for a Year's Growth of a New Jersey Fruit Planting

charge by truck is a trifle lower than freight alone. Some of the machines are owned by New York wholesalers and some by trucking concerns.

J. C. Hendrickson is one of the leading growers of the Keyport section. He has fourteen acres of asparagus, which is ridged high during the cutting season and is cut white. Much of the product is “sold where grown at the Old Cherry Tree,” for Mr. Hendrickson is located on one of the great seashore highways and has a well-developed roadside market. He sells a wide variety of goods, both purchased and grown. When asked whether the two classes of merchandise mix well, he said: “We can sell anything that is good.” Perhaps this is the key to the argument as to whether a stand should sell nothing but the product of the home farm.

Mr. Hendrickson has extensive orchards, and is increasing his plantings. Vegetables are grown between the rows while the trees are on their way to maturity.

Late Crops

A growing interest is being shown by vegetable men in late fall markets. Prices are usually better than in mid-season, and harvests thus timed serve to lengthen the season of income and of the profitable use of labor. An up-State gardener is setting tomatoes as late as the last of June. He does not expect all to be ripe before frost, but when a severe night threatens he will gather the green fruits in quantity and allow them to ripen under the protection of his barn roof.

it is hard to see how any but the most efficient operators can make ends meet.

For four years the Troy Market Gardeners' Association has operated a market of its own at Watervliet because the city authorities of Troy would not afford a satisfactory public market. The gardeners have put up a game fight in face of serious odds, and now they win. The present city administration, after friendly conference, has arranged to care for the needs of the growers in a manner agreeable to all, and the Association officially came back on June 7 from its sojourn beyond the river. They still hold the Watervliet property that they bought four years ago.

A July Story

(Continued from page 21)

when the other boys had gone away, that maybe your pa is a darned old fool; maybe he don't keep up with the times very good; but we've had pleasant days working the fields together, and I want them to continue. Just forget this little unpleasantness, and we'll tell neighbor Barrett his clover can rot for all of us. And maybe, too, you are right about this cow business. Anyway, if you will only stay on with me for a spell longer you can house-clean and renovate the darned old dairy all you want to.”

We have enjoyed your paper very much, and think it more than worth the price.—Mrs. S. Balogh, Willoughby, Ohio.

Save the Potato Crop

Spraying or Dusting as Necessary as Cultivating

IT is not a question of "shall I dust" or "shall I spray my potatoes"; but it is a question of fighting bugs and plant disease or taking a chance on losing the whole crop. I have known farmers who have, in the past, hit it "lucky" by making a guess at the beginning of the season that there would be few if any bugs and no blight. However, for every one who has made that guess and gotten away with it, there are hundreds who have been caught and lost the better part of their crop.

Whether we use liquid spray or dust, to fight bugs is mighty good as insurance, and most successful growers consider it that way these days, especially in times like the present when a short crop is in prospect. Of course it costs money, but year in and year out, the costs of buying poisons and fungicides is more than counterbalanced by increased returns. Fundamentally, the same fungicides and insecticides are used in dusting as in spraying. The copper lime dust is identical to Bordeaux and water is merely a carrier of arsenate of lead powder.

Bordeaux is made by mixing copper sulphate or bluestone and burnt lime. For the grower who has only a small patch, the most favorable method is to dissolve five pounds of copper sulphate in five gallons of water. Lime is also diluted at the same rate, five pounds in five gallons of water. But these

By F. W. OHM

tions spray. Their claim is that they tried it once and the "danged stuff wouldn't work." Of course it wouldn't work when new foliage was coming on all the while and no spray was applied to protect it from diseases. Spray should be applied every ten days at least, and it should be applied in such a manner that the entire leaf surface, on top and underneath, is covered with a thin film of mixture. That is why a "three nozzle to a row" machine is best. It is not possible to cover the plant properly by merely squirting or sprinkling the material on the plant, although recommendations are published to the effect that in the absence of a spray outfit, it is possible to use a whisk broom to very good affect. Good spraying demands lots of pressure, enough to create a fog, rather than a spray—the higher the pressure, the better the fog and the better distribution of liquid.

Dusting Methods Much Improved

There is nothing new in the practice of dusting except that the methods of application have been developed to a higher degree. Dusting apparatus is being perfected every year and the mechanical condition of dust is likewise being improved. The big talking point in favor of the duster is that it eliminates the handling of so much water and is consequently much more rapid.

The "three nozzle to a row" arrangement makes it possible to hit every part of the potato vine with the spray material

concentrated solutions are not mixed directly. Each is poured into a fifty-gallon barrel which contains forty gallons of clear water. This makes fifty gallons of spray material known as a 5-5-50. In order to fight bugs, two pounds of arsenate of lead powder are added to this fifty gallons of Bordeaux.

Down on Long Island, where it is common for a grower to have seventy-five or one hundred acres of potatoes, a great deal of spray material is used and consequently much larger batches must be mixed. It is common for big growers to have a platform built high enough to back the spray rig under. On the platform are two barrels, one containing the copper sulphate solution and the other containing the lime solution. Between the two there is a large reservoir of water. When the spray tank is to be filled, it is backed under this reservoir and the water is piped directly into the spray tank and the copper and lime solutions are added in the proportions just mentioned. Sometimes the field that is being sprayed is considerable distance from the house. In order to eliminate loss of time, the barrels of chemicals and the water reservoir are loaded on to a wagon kept in the field. A one-horse water cart keeps the reservoir filled.

There are two factors that practically measure the success or failure of liquid spray materials to fully control plant insects and disease. They are regularity of application and pressure. I know of some potato growers who start cussing as soon as anyone men-

Men using dusters claim they can cover a field many times quicker than they can with liquid spray apparatus. This is obvious, for they do not have to stop to fill up with water after every few "bouts" of the field. It is possible to carry enough dust material on the rig to treat an entire field without making a single stop.

I was talking to a big potato grower from the eastern end of Long Island recently about dusting and spraying. He spoke very highly of dusting as far as results were concerned. However, he is well equipped with modern spraying apparatus and has his spray material or stock solution barrels so conveniently arranged that it would not pay him to junk this equipment to buy a duster. I called his attention to the potato-growing fields of such New York counties as Franklin, Clinton, Steuben and the southern ends of Livingston and Ontario, where very often potato growers have to climb steep hill-sides to get up to their fields, much in contrast to the level stretches of Long Island. The man from Suffolk County said: "If I were growing potatoes in that section I doubt if I would even try to use a sprayer. It must be terrible work for those fellows to try to get water up on top of the hills and it must be time-consuming. That is where the duster serves a real purpose. No doubt, they will come in a whole lot faster as soon as the price of dust comes down to a more reasonable figure, which is another one of

(Continued on page 30)

AFTERGLOW of ROUGHWOOD, 84605. World's Champion Junior 3-year old Guernsey, Class E, with 878.16 lbs. fat from 16,815.7 lbs. milk. Owned and bred by Mr. E. B. Dane, Chestnut Hill, Mass. FED ON BUFFALO DURING THE RECORD MAKING YEAR.

Buffalo Scores Another World's Record

This is getting to be a common occurrence when great purebreds, such as "Afterglow," are fed on this feed.

A still commoner occurrence is the increase in milk production made by grade cows as soon as Buffalo Corn Gluten Feed is added to the ration.

With your herd on pasture, feed Buffalo this way: 3 parts Buffalo, 2 parts hominy, 2 parts bran. Then watch for the extra milk.

It's no idle saying that Buffalo is

Boys and Girls Prominent at College Field Days

THE outstanding event of the Summer field days held at the New York State College of Agriculture, June 27th to 29th, was the large attendance of boys and girls who are interested in junior project work. Over 500 boys and girls were present from sixteen counties. They were welcomed to the College by Dean A. R. Mann and by Livingston Farrand, president of Cornell University.

The first day was spent in visiting various points of interest about the campus and university buildings. On Thursday and Friday the boys attended demonstrations on judging dairy cattle, gardening, rope-splicing, sheep and hogs, poultry and potatoes. The girls spent the two days attending demonstrations by teams from some of the counties and by the extension workers of the Home Economics Department.

In talking to the boys and girls, Dean Mann said: "The great purpose of junior extension work is not that a boy may learn to raise a quarter acre of potatoes or a girl learn to can tomatoes. Those are not the important things we have in mind. They are the means we use to accomplish the important things. The reason we do this work is to train the head, the hands, the heart and health as represented by your emblem; to train the head to think and plan and reason; to train the hands to be useful and

skillful; to train the health so as to resist disease, to be 100 per cent efficient and enjoy life; and finally, to train the heart to be true and kind and sympathetic."

In addition to the large attendance of boys and girls, many adults were present, including nearly all of the county farm bureau agents and the farm bureau executive committees. Visits were made to the State experiment station at Geneva and to the great farms belonging to the State College of Agriculture.

NON-POOLERS ANNOUNCE JULY PRICES

At a meeting of the Executive Committee of the Non-Pooling Dairymen's Cooperative Association and a committee of the New York Milk Conference Board, held June 26, the price negotiated for non-pool milk for the month of July was as follows: Class No. 1, \$2.30; class No. 2, \$2.00; flat price, \$2.20; class 3A the differential was increased from 55c to 80c; class 3B the differential was increased from 40c to 65c; class 4A the differential was increased from 20c to 25c. In Grade A the 20c differential was increased to 30c, the 25c differential increased to 40c, and the 15c differential increased to 25c. The principal increase is in the increase of the flat price from \$2.11 to \$2.20. Most of the non-pool milk is sold on the flat price basis. All prices are for 3 per cent milk in 201-210 mile zone with the addition of 4c per point of butter fat content above 3 per cent, and the addition or deduction on account of the freight differential.

NEW YORK COUNTY NOTES

Montgomery Co.—On July 3, the date of writing, a large amount of buckwheat is being sown in this locality. Farmers are using the crop with other small grains for feed. Milk is bringing a fair price, but hay sells at from \$9 to \$12 per ton. The new crop of hay will not yield as heavily as was expected early in the season. The stand is good, but short. Some farmers are cutting alfalfa and June clover. Ensilage corn is making slow growth owing to cool nights. The acreage of potatoes is not large, but the fields look to be in good shape. Eggs are selling at 25c a dozen, veal 9c, live weight. Not many broilers on the market here, only about 40 per cent. Farm help is so scarce here that many acres lie fallow and many meadows will be left unharvested. Many good farms are for sale, but buyers are few and far between. Town highways are being well repaired as there is plenty of help for that work at a good daily wage. The plum crop will be small in this locality owing to the heavy rains at blossoming time.—G. P. VAN V.

Ontario Co.—We have had some very hot weather during the latter part of June; in fact, during the last week the temperature was above 90 in the shade. We have been in need of rain all along, but lately we have had some good showers. It has been too hot and dry to set cabbage. Some growers are complaining about the lack of plants due to maggot injury and poor seed. Greening apples have not set very heavily in comparison to the amount of bloom. Corn is making good growth. Some farmers are harvesting alfalfa, which is not very heavy.—E. T. B.

Warren Co.—All crops are very late and are not looking especially good. The hay crop will be light. Recent rains have improved the outlook to some extent. Old meadows will be very light and in some places will not more than pay the high prices of labor to cut them. The price of farm help is out of reach of most people. Farmers are doing what they can without hiring help. Prices for produce are lower than a year ago. Old potatoes are scarce and nearly all gone. The new crop is not ready yet. Farm Bureau meetings are being held every month. Interest is good.—R. T. A.

A Fair Question and a Reasonable Answer

The question is sometimes asked us, although less frequently as more and more De Laval Milkers are put in use and the wisdom of the De Laval method is demonstrated, why we make only single unit milkers.

The De Laval Milker Unit is designed to milk one cow at a time. Of course as many units as desired can be used in an installation, and all of the units, no matter how many are used, work with exactly the same uniform and pleasing action. This method has proved to be the most practical as well as the fastest.

With a double unit it is necessary to arrange the cows so that those which require about the same length of time to be milked are placed side by side, and it is practically impossible to do this unless the cows are constantly rearranged, which causes confusion and delay. Thus with a double unit, if the cows do not milk out in exactly the same time, part of the outfit is idle or is left on the cow too long.

Numerous tests have shown that two single units milk about one-third faster than one double unit, and one man can handle two single units faster than one double unit. In actual practice many De Laval operators are handling three units alone, and each unit will milk about ten average cows or more an hour.

Another advantage of the single unit, which is very important especially in purebred test work and for which many De Laval are now used, is that it is possible to weigh each cow's milk when individual cow records are desired.

Of course this is only one of many features which is making the De Laval Milker so popular with dairymen everywhere. On more than 12,000 farms the De Laval Milker is saving time and labor, increasing the production of milk, producing cleaner milk, and making dairying more pleasant and profitable. If you are milking ten or more cows by hand, you are paying for a De Laval.

Easy Terms

You can get a De Laval Milker for 10% down and the rest in 15 monthly payments of 6%. Use a De Laval while it pays for itself.

New Jersey Horticulturists to Hold Summer Meeting in Glassboro

FRUIT and vegetable growers from all parts of the State will assemble for the summer meeting of the State Horticultural Society on the campus of the new State Normal School in Glassboro on Wednesday, July 25.

Representatives of the staff of the State Experiment Station at New Brunswick have been conducting important spraying experiments in the orchards of the Repp Company. The lessons from these experiments will be demonstrated during the tour of several large orchards near Glassboro. The run will be made by automobiles leaving the Normal School at 10 o'clock, standard time.

After lunch in the beautiful oak grove adjacent to the Normal School, the members and visitors will assemble for a meeting. They will be addressed by Mayor Frank Stanger and Mr. Charles F. Repp, of Glasboro, Senator Emmor Robberts, President of the Horticultural Society, Dr. J. J. Savitz, Principal of the New Jersey Normal School, and Mr. L. A. Cooley, Secretary of the New Jersey State Federation of County Boards of Agriculture. Professor M. A. Blake, Horticulturist at the State Experiment Station, Professor A. J. Farley, Pomologist, Dr. T. J. Headlee, State Entomologist, and Dr. W. H. Martin, Plant Pathologist, will lead discussions on the best practices in orchard and field work.

Last year the summer meeting was held at Minch Bros. farms near Bridgeton. There was an attendance of nearly 1,000 persons. The meeting this year is expected to be even larger. It will be held in the Normal School building in the event of rain.

SHEEP BREEDERS ESTABLISH SCHOLARSHIP AT PENN STATE

A special scholarship is to be established at the Pennsylvania State College as the result of a \$5,000 fund provided by the Pennsylvania State More Sheep More Wool Association. It is to be known as the "Arthur C. Bigelow Memorial Scholarship" in honor of the late organizer of the association, a former prominent textile manufacturer of Philadelphia. The interest from the fund will be awarded each year to a student in the State College animal husbandry course who is specializing in sheep studies and who is deserving of the award by reason of his scholastic standing.

"Going To Law"

(Continued from page 19)

up to nearly eleven thousand dollars! How many such cases—not quite so striking perhaps—have come under the notice of most persons. How many estates have been wasted, and heirs beggared, by an unwillingness to make slight concessions.

But the pecuniary loss, serious as it often may be, is not the worst feature in the business. The hatred engendered, and bad passions nourished, react sadly upon the parties engaged. The disposition is soured, peace banished, and constant vexations and apprehension embitter life. Said one who had finally obtained his suit, involving a large amount, and one which he could ill afford to lose: "Had I foreseen the anxiety and vexation I have suffered from this business, I would have given a receipt in full for the amount, rather than have commenced." Many others will bear the same testimony. There are cases where it is positive duty to invoke the aid of law to secure or preserve rights, but reason, not passion, should preside when such interests are involved.

We repeat, then, if any of our readers are now, or hereafter, tempted to indulge in "law," let them first give this picture a careful study, and then inquire if it will not be better to lose the milk at once, than to hold the cow with might and main, for an indefinite period, and in the end find all the labor lost.

Wishing you success in your good work.—Phil R. Goodives, Ritchey, Ill.

PUBLIC FORMULA FEEDS

THE Cooperative G. L. F. Exchange is securely established.

It has wiped out the operating deficit which existed on January 1, 1923, and during the first six months of the current year has increased its gross business by a million dollars over the same period last year.

The service the G. L. F. renders you in the future will depend primarily on the volume of purchases it makes for you. Volume voluntarily placed means savings in overhead and sales cost. Orders secured without the expense of direct solicitation mean lower prices to you and your neighbors.

The G. L. F. Feed Pool which opens this month affords you the opportunity to buy your winter feed at summer prices. It also furnishes you the added guarantee of securing the best dairy feed available at the lowest possible price per hundred pounds of digestible nutrients.

Thoughtful deliberation will convince you of the wisdom of using the G. L. F. to buy your feed for you. Remember, orders voluntarily placed make the pool price lower.

N. F. Webb

Classified Advertising Rates

ADVERTISEMENTS are inserted in this department at the rate of 5 cents a word. The minimum charge per insertion is \$1 per week. Count as one word each initial, abbreviation and whole number, including name and address. Thus: "J. B. Jones, 44 E. Main St., Mount Morris, N. Y." counts as eleven words.

Place your wants by following the style of the advertisements on this page.

Our Advertisements Guaranteed

THE American Agriculturist accepts only advertising which it believes to be thoroughly honest. We positively guarantee to our readers fair and honest treatment in dealing with our advertisers.

We guarantee to refund the price of goods purchased by our subscribers from any advertiser who fails to make good when the article purchased is found not to be as advertised.

To benefit by this guarantee subscribers must say: "I saw your ad in the American Agriculturist" when ordering from our advertisers.

The More You Tell, The Quicker You Sell

EVERY week the American Agriculturist reaches over 120,000 farmers in New York, New Jersey, Pennsylvania and adjacent States. Advertising orders must reach our office at 461 Fourth Avenue, New York City not later than the second Monday previous to date of issue. Cancellation orders must reach us on the same schedule. Because of the low rate to subscribers and their friends, cash or money order must accompany your order.

**ALL GOOD THINGS COME TO HIM WHO WAITS—BUT
THE CHAP WHO DOESN'T ADVERTISE WAITS LONGEST**

EGGS AND POULTRY

SO MANY ELEMENTS enter into the shipping of day-old chicks and eggs by our advertisers, and the hatching of same by our subscribers that the publishers of this paper cannot guarantee the safe arrival of day-old chicks, or that eggs shipped shall reach the buyer unbroken, nor can they guarantee the hatching of eggs. We shall continue to exercise the greatest care in allowing poultry and egg advertisers to use this paper, but our responsibility must end with that.

ALL men, women, boys, girls, 17 to 60, willing to accept Government positions, \$117-\$190, traveling or stationary, write MR. OZMENT, 258 St. Louis, Mo., immediately.

BEEES

WILLOWDELL 3-BAND Italian Queens, by return mail. They get results; one, \$1.15; 6 for \$6; 12 for \$10. H. S. OSTRANDER, Mellenville, N. Y.

The Brown Mouse—By Herbert Quick

(For a synopsis of preceding issues, see page 28)

"AND do you think," queried Jim, "that my abandonment of the things in which I believe in the face of this attack would prove to your mind that I am competent? Or would it show me incompetent?"

Again Jennie was silent.

"I guess," said Jim, "that we'll have to stand or fall on things as they are."

"Do you refuse to resign?" asked Jennie

"Sometimes I think it's not worth while to try any longer," said Jim. "And yet, I believe that in my way I'm working on the question which must be solved if this nation is to stand—the question of making the farm and farm life what they should be and may well be. I'll have to think about it. Suppose I refuse to resign?"

Jennie had drawn on her gloves, and stood ready for departure.

"Unless you resign before the twenty-fifth," said she, "I shall hear the petition for your removal on that date. You will be allowed to be present and answer the charges against you. The charges are incompetency. I bid you good evening!"

"Incompetency!" The disgraceful word, representing everything he had always despised, rang through Jim's mind as he walked home. He could think of nothing else as he sat at the simple supper which he could scarcely taste. Well, had he not always been incompetent, except in the use of his muscles? Were not all his dreams as foreign to life and common sense as the Milky Way from the earth? What reason was there for thinking that this crusade of his for better schools had any sounder foundation than his dream of being president, or a poet or novelist, or philosopher? He was just a hayseed, a rube, a misfit, as odd as Dick's hatband, an off ox. He was incompetent. He picked up a pen, and began writing. He wrote, "To the Honorable the Board of Education of the Independent District of ———" And he heard a tap at the door. His mother admitted Colonel Woodruff.

"Hello, Jim," said he.

"Good evening, Colonel," said Jim. "Take a chair, won't you?"

"No," replied the colonel. "I thought I'd see if you and the boys at the schoolhouse can't tell me something about the smut in my wheat. I heard you were going to work on that to-night."

"I had forgotten!" said Jim.

"I wondered if you hadn't," said the colonel, "and so I came by for you. I was waiting up the road. Come on, and ride up with me."

THE colonel had always been friendly, but there was a new note in his manner to-night. If he had been talking to the president of the state university, his tone could not have been more courteous. He worked with the class on the problem of smut. He offered to aid the boys in every possible way in their campaign against scab in potatoes. He suggested some tests which would show the real value of the treatment. The boys were in a glow of pride at this cooperation with Colonel Woodruff. This was real work! Jim and the colonel went away together. It had been a great evening.

"Jim," said the colonel, "can these kids spell?"

"I think," said Jim, "that they can outspell any school about here."

"How about arithmetic and the other branches? Have you sort of kept them up to the course of study?"

"I have carried them in a course parallel to the text-books," said Jim, "and covering the same ground. But it has been vocational work, you know—related to life."

"Well," said the colonel, "if I were you, I'd put them over a rapid review of the text-books for a few days—say between now and the twenty-fifth."

"What for?"

"Oh, nothing—just to please me. . . . And say, Jim, I glanced over a communication you have started to the more or less Honorable Board of Education."

"Yes?"

"Well, don't finish it. . . . And say, Jim, I think I'll give myself the luxury of being a wild-eyed reformer for once."

"Yes," said Jim, dazed.

"And if you think, Jim, that you've got no friends, just remember that I'm for you."

"Thank you, Colonel."

"And we'll show them they're in a horse race."

"I don't see. . . ." said Jim.

"You're not supposed to see," said the colonel, "but you can bet that we'll

be with them at the finish; and, by thunder! while they're getting a full meal, we'll get at least a lunch. See?"

"But Jennie says," began Jim.

"Don't tell me what she says," said the colonel. "She's acting according to her judgment, and her lights and other organs of perception, and I don't think it fittin' that her father should try to influence her official conduct. But you go on and review them common branches, and keep your nerve. I haven't felt so much like a scrap since the day we stormed Lookout Mountain. I kinder like being a wild-eyed reformer, Jim."

CHAPTER XIII

FAME OR NOTORIETY

THE office of county superintendent was, as a matter of course, the least desirable room of the court-house. It opened off the central hall at the upper end of the stairway which led to the court room, and when court was in session, served as a jury room. At such times the county superintendent's desk was removed to the hall, where it stood in a confusing but very democratic publicity. Superintendent Jennie might have anticipated the time when offenders passing from the county jail in the basement to arraignment at the bar of justice might be able to peek over her shoulders and criticize her method of treating examination papers. On the twenty-fifth of February, however, this experience lurked unsuspected in her official future.

Poor Jennie! She anticipated nothing more than the appearance of Messrs. Bronson, Peterson and Bonner in her office to confront Jim Irwin. At nine forty-five Cornelius Bonner, and his wife entered the office, and took twenty-five per cent of the chairs therein. At nine fifty Jim Irwin came in, haggard, weather-beaten and seedy as ever, and looked as if he had neither eaten nor slept since his sweetheart stabbed him. At nine fifty-five Haakon Peterson and Ezra Bronson came in, accompanied by Wilbur Smythe, attorney-at-law, who carried under his arm a code of Iowa, a compilation of the school laws of the State, and *Throop on Public Officers*. At nine fifty-six, therefore, the crowd in Jennie's office exceeded its seating capacity, and Jennie was in a flutter as the realization dawned upon her that this promised to be a more public affair than she had anticipated. At

nine fifty-nine Raymond Simms opened the office door and there filed in enough children, large and small, some of them accompanied by their parents, and all belonging to the Woodruff school, to fill completely the corners and angles of the room. In addition there remained an overflow meeting in the hall, under the command of that distinguished military gentleman, Colonel Albert Woodruff.

"Say Bill, come here!" said the colonel, crooking his finger at the deputy sheriff.

"What you got here, Al!" said Bill, coming up the stairs, puffing. "Ain't it a little early for Sunday-school picnics?"

"This is a school fight in our district," said the colonel. "It's Jennie's baptism of fire, I reckon. . . . and say, you're not using the court room, are you?"

"Nope," said Bill.

"WELL, why not just slip around, then," said the colonel, "and tell Jennie she'd better adjourn to the big room."

Which suggestion was acted upon instantaneously by Deputy Bill.

"But I can't, I can't," said Jennie. "I don't want all this publicity, and I don't want to go into the court room."

"I hardly see," said Deputy Bill, "how you can avoid it. These people seem to have business with you, and they can't get into your office."

"But they have no business with me," said Jennie. "It's mere curiosity."

Whereupon Wilbur Smythe, who could see no particular point in restricted publicity, said, "Madame County Superintendent, this hearing certainly is public or quasi-public. Your office is a public one, and the right to attend this hearing surely is one belonging to every citizen and taxpayer of the county, and if the taxpayer, *qua* taxpayer, then certainly a *fortiori* to the members of the Woodruff school and residents of that district."

Jennie quailed. "All right, all right!" said she. "But, shall I have to sit on the bench?"

"You will find it by far the most convenient place," said Deputy Bill.

Was this the life to which public office had brought her? Was it for this that she had bartered her independence—for this and the musty office, the stupid examination papers, and the interminable visiting of schools, knowing that such supervision as she could give was practically worthless? Here was she, called upon to pass on the competency of the man who had always been her superior in everything that constitutes mental ability. And that crowd! To Jennie it was appalling. The school board under the lead of Wilbur Smythe took seats inside the railing which on court days divided the audience from the lawyers and litigants. Jim Irwin, who had never been in a court room before, herded with the crowd, but to Jennie, seated on the bench, he, like other persons in the auditorium, was a mere blurry outline with a knob of a head on its top.

She couldn't call the gathering to order. She had no idea as to the proper

procedure. She sat there while the people gathered, stood about whispering and talking under their breaths, and finally became silent, all their eyes fixed on her.

"May it please the court," said Wilbur Smythe, standing before the bar. "Or, Madame County Superintendent, I should say. . . ."

A titter ran through the room, and a flush of temper tinted Jennie's face. They were laughing at her! She wouldn't be a spectacle any longer! So she rose, and handed down her first and last decision from the bench.

"Mr. Smythe," said she, "I feel very ill at ease up here, and I'm going to get down among the people. It's the only way I have of getting the truth."

She descended from the bench, shook hands with everybody near her, and sat down by the attorney's table.

"Now, said she, 'this is no formal proceeding and we will dispense with red tape. Where's Mr. Irwin? Please come in here, Jim. Now, I know there's some feeling in these things—there always seems to be; but I have none. So I'll just hear why Mr. Bronson, Mr. Peterson and Mr. Bonner think that Mr. James E. Irwin isn't competent to hold a certificate.'

Jennie was able to smile at them now, and everybody felt more at ease, save Jim Irwin, the members of the board and Wilbur Smythe. That individual arose, and talked down at Jennie.

"I appear for the proponents here," said he, "and I desire to suggest certain principles of procedure which I take it, belong indisputably to the conduct of this hearing."

"Have you a lawyer?" asked the county superintendent of the respondent.

"A what?" exclaimed Jim. "Nobody here has a lawyer!"

"Well, what do you call Wilbur Smythe?" queried Newton Bronson from the midst of the crowd.

"He ain't lawyer enough to hurt!" said the thing which the dramatists call A Voice.

THERE was a little tempest of laughter at Wilbur Smythe's expense, which was quelled by Jennie's rapping on the table.

"I have no way of retaining a lawyer," said Jim, on whom the truth had gradually dawned. "If a lawyer is necessary, I am without protection—but it never occurred to me. . . ."

"There is nothing in the school laws, as I remember them," said Jennie, "giving the parties any right to be represented by counsel. If there is, Mr. Smythe will please set me right."

She paused for Mr. Smythe's reply.

"There is nothing which expressly gives that privilege," said Mr. Smythe, "but the right to the benefit of skilled advisers is a universal one. And in opening this case for my clients, I desire to call your honor's attention—"

"You may advise your clients all you please," said Jennie, "but I'm not going to waste time in listening to speeches, or having a lot of lawyers examine witnesses."

"I protest," said Mr. Smythe.

"Well, you may file your protest in writing," said Jennie. "I'm going to talk this matter over with these old friends and neighbors of mine. I don't want you dipping into it, I say!"

Jennie's voice was rising toward the scream-line, and Mr. Smythe recognized the hand of fate. One may argue with a cantankerous judge, but the woman, who like necessity, knows no law, and who is smothering in a flood of perplexities, is beyond reason. Moreover, Jennie dimly saw that what she was doing had the approval of the crowd, and it solved the problem of procedure.

There was a little wrangling, and a little protest from Con Bonner, but Jennie ruled with a rod of iron, and adhered to her ruling. When the hearing was resumed after the noon recess, the crowd was larger than ever, but the proceedings consisted mainly in a conference of the principals grouped about Jennie at the big lawyers' table. The only new thing was the presence of a couple of newspaper men, who had

This Is Open Season For Flies

Swat Them Early and Late—Midsummer Pattern Suggestions

NOTHING is so discouraging, we admit, as the everlasting task of keeping down the fly-supply.

Yet nothing is so essential if health is a consideration. No agency in the world seems better equipped than the common—all too common—housefly for transmitting disease.

The fly collects parasites on its body by visiting infected materials, and transports them to man and his food. The fly's mouth is spongy, its feet are provided with sticky pads and its body is covered with hair. It is ideally built in the first place as a carrier of disease, and its habits further make it a direct menace to human life.

The indifference which permits flies to breed and then is content with lazily shooing them from sugar bowl, butter or milk, only to have them return or light on other food, is inexcusable.

Each farm, as a rule, raises its own supply of flies. Horse manure is the first choice for a breeding place, though any sort of decayed matter is popular with this filth-fed insect. Few breed in outside closets, but the adult flies visit such places to feed and from them go to kitchen or milk pail.

The necessity of treating manure to destroy fly eggs and maggots seems obvious. Its neglect is inexcusable, when you consider that one pound of commercial powdered borax does the job for every sixteen bushels or twenty cubic feet of fresh stable manure. Add a little water to spread the borax. Plenty of lime should be used in out-houses, which should also be guarded to prevent the entrance of flies.

In spite of precautions, flies will breed, and homes and food must be protected. Economy in screens is inviting trouble. Sticky paper, flytraps, swatters, poison bait and recent spraying devices (more expensive but most efficacious of all methods of killing flies) are all available. Milk, milk-pails and fruits at canning time should all have special care.

Because of the places where the fly collects the filth on feet and body, and its fondness for walking over food immediately thereafter, the most common diseases brought by this pest are those of intestinal character. Typhoid has repeatedly been traced to flies and flies alone. Infants and children are especially subject to the hot-weather germ borne diseases, and to permit flies around a baby or a baby's food is almost criminal carelessness.

Swat the fly this summer. See that there are no inviting breeding places where the pest in immature stages may start next spring's crop. When spring comes, go after the early comers with a vengeance, for the destruction of one fly then equals the slaughter of hundreds later. At midsummer they are at their height in number and hunger, so untiring vigilance is the only method of control.

TO HIDE AN UGLY STUMP

Perhaps there is some unsightly stump or rubbish pile in your immediate surroundings that you'd like to cover up, yet you've hesitated to bother starting vines around it.

This spring, prepare the soil around the "eye-sore" and plant a few hills of ordinary field pumpkins!

When the vines start, train them to cover the object desired, and the result will be a joy to the eye all summer and until late autumn; first the green of the vines with their big leaves, then the handsome yellow blossoms, and, lastly, the yellowed leaves and the ripe pumpkins with promise of an "endless" round of pies.

It is a small task, but one that will pay well for the doing.—**MABELLE ROBERT.**

WHEN COOKING FRUITS

If fruits are wanted rich and luscious, they should be given long, slow cooking.

Add the sugar as desired, when you add the water. Let come to a boil slowly. Put on plenty of water, cover the fruit thoroughly, as much will evaporate in the cooking; and let them cook down as thick as desired.

Even "common" apple sauce is a fine dish if treated in this way. Prove it by dividing your apples, season precisely alike, cook one dish up quickly and remove from the stove as soon as done; then cook the other one for several hours, and note the difference.

Pears and peaches respond equally well to this long cooking, but it colors them dark. To keep fruits white, or clear, cook them very briskly and remove from the fire as soon as done.—**C. A. B.**

The Brown Mouse

(Continued from page 27)

queried Chicago papers on the story, and been given orders for a certain number of words on the case of the farm-hand schoolmaster on trial before

JUST TO REMIND YOU

INFLUENCED by members of the school board, who are infuriated by Jim Irwin's calm way of going ahead in his plan for a class-room program related to life against their protests, Jennie Woodruff, the school superintendent tries to induce him to give up his "notions."

But Jim, former field-hand, is a "Brown Mouse"—a man of vision and ideas. Jennie's father, the Colonel, has been watching him all along and intends to back the friendless teacher, when the show-down comes.

his old sweetheart for certain weird things he had done in the home school in which they had once been classmates.

By the time at which gathering

darkness made it necessary for the bailiff to light the lamps, the parties had agreed on the facts. Jim admitted most of the allegations. He had practically ignored the text-books. He had burned the district fuel and worn out the district furniture early and late, and on Saturdays. He had introduced domestic economy and manual training, to some extent, by sending the boys to the workshops and the girls to the kitchens and sewing-rooms of the farmers who allowed those privileges. He had induced the boys to test the cows of the district for butter-fat yield. He was studying the matter of a co-operative creamery. He hoped to have a blacksmith shop on the schoolhouse grounds sometime, where the boys could learn metal working by repairing the farm machinery, and shoeing the farm horses. He hoped to see a building sometime, with an auditorium where the people would meet often for moving picture shows, lectures and the like. He hoped to open to the boys and girls the wonders of the universe which are touched by the work on the farm. He hoped to make good and contented farmers of them, able to get the most out of the soil, to sell what they produced to the best advantage, and at the same time to keep up the fertility of the soil itself. And he hoped to teach the girls in such a way that they would be good and contented farmers' wives. He even had in mind as a part of the schoolhouse the Woodruff District would one day build, an apartment in which the mothers of the neighborhood would leave their babies when they went to town, so that the girls could learn the care of infants.

"An' I say," interposed Con Bonner, "that we can rest our case right here. If that ain't the limit, I don't know what is!"

(Continued next week)

FOUR WARM WEATHER "SPECIALS" FOR EASY SEWING

FIRST, for the girl who needs lots of washable frocks, **No. 1797** is easy to launder, and no more convincing proof of its simplicity to make, need be given than the cutting diagram in the corner.

No. 1797 cuts in sizes 6, 8, 10, 12 and 14 years. Size 8 requires 1¾ yards 36-inch material with ¼ yard 36-inch material contrasting and ¾ yard binding. **Price, 12c.** stamps.

AND for the woman who needs one more dressy blouse to wear with her new pleated skirt, **No. 1794** solves the problem. It combines a deep circular collar and the popular jacquette effect.

No. 1794 comes in sizes 16 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 1¾ yards of 36-inch material with 7½ yards of binding. **Price, 12c.**

HERE is the warm weather frock for either a young girl or her older sister. You could add the embroidery as a smart last touch, but the dress is complete without it. A monogram is seen on dozens of summer frocks and gives an odd, individual effect.

No. 1689 cuts in 14 and 16 year sizes and 36, 38, 40 and 42 inches bust measure. The ladies' size requires 2¾ yards 32 or 44-inch material, with 2¾ yards of binding. **Price, 12c.** stamps. **Transfer 632, 12c** additional.

1794

1787

AONE-PIECE porch or bungalow apron is our next hot weather suggestion. You will notice the laundry saving device in the detachable bib section, which can be washed and ironed separately. This also makes the apron appear almost a dress when the sash is tied.

No. 1787 is cut in sizes 34, 36, 38, 40 and 42 inches. Size 36 requires 3¾ yards of 36-inch material, with 4¼ yards of edging or rick-rack braid. **Price, 12c.** stamps.

To Order: Write name, address, pattern numbers and sizes clearly; enclose 12c for each pattern, and send your order to Fashion Department. The Summer catalogue, a guide book to the fashions, is only 10c extra, and we suggest that you order your copy to-day.

Seven Simple Lace Edgings

A PRETTY lace edging always gives an attractive finish to a table set or, in fact, to almost any piece of table or room linen, scarfs, or baby clothes. Seven simple edgings are shown in the picture, and they are all illustrated in a book entitled "Crochetercraft." We are giving the directions for all the different edgings, but shall be glad to send the book to any reader for 75c, postpaid.

Edging No. 1

Little Fan—38 yds. C to 1 yd. lace. First row: Ch 11, 1 tr in 8th st from needle, ch 2, 1 tr in 1st ch made (2 sp), ch 5, turn.

Second row: Skip 2 ch, tr in tr (1 sp), 7 tr over 7 ch, ch 3, turn.

Third row: Skip 1st tr, 1 s st in next tr, ch 3, skip 1 tr, s st in next tr, ch 3, skip 1 tr, tr in next tr, ch 2, tr in 3rd of 5 ch, ch 5, turn.

Fourth row: Skip 2 ch, tr in tr, ch 7, turn.

Fifth row: Tr in tr, ch 2, tr in 3rd of 5 ch, ch 5, turn. Repeat from 2nd row for length ending with 4th row.

Edging No. 2

Horn of Plenty—54 yds. C to 1 yd. lace.

First row: Ch 10, tr in 7th ch from needle, ch 2, tr in 1st ch made, ch 3, turn.

Second row: Over the 2 ch make 1 tr, ch 2, 1 tr, then tr over tr, ch 1, tr in 3rd of 7 ch, ch 4, turn.

Third row: Tr over each of 2 tr and 1 over ch, ch 2, tr over ch and each of 2 tr, ch 6, turn.

Fourth row: S st in 4th from needle, *tr in tr, ch 3, s st in top of

needle, *tr in next tr, ch 3, s st in top of tr (picot) repeat from *9 times, tr in each of 2 tr, ch 7, turn.

Seventh, eighth and ninth rows: Like second.

Tenth row: Like fifth.

Eleventh row: Like sixth, except that instead of 6 ch you make 4 ch, 1 s st in second picot of sixth row, ch 1, 1 s st in 3rd of 4 ch, and then on like sixth row.

Repeat for length desired.

Edging No. 5

Narrow Filet—31 yds C to 1 yd lace.

Ch 7. 1st row: 1 sp (tr in 1st ch made), ch 5, turn.

2nd row: 1 blk (tr in 4th and 5th from needle and over tr, the 3 ch counting as 1 tr), ch 2 tr in 3rd ch below (1 sp), ch 5, turn.

Third row: 2 sp, ch 5, turn.

Fourth row: 1 blk (as in 2nd row), 2 sp, ch 5, turn.

Fifth row: Like 3rd row. Ch 3, turn.

Sixth row: 1 blk over sp, 1 sp, ch 5, turn.

Repeat from first row.

Edging No. 6

Saw Tooth—31 yds. C to 1 yd. lace. Ch. 7.

First row: Tr in 1st ch made to form 1 space, ch 5, turn.

Second row: 4 tr over 2 ch, ch 3, turn.

Third row: 1 s st in 2nd tr, ch 3, 1 tr in 4th tr, ch 2, 1 tr in 3rd of 5 ch, ch 5, turn.

Repeat second and third rows.

Edging No. 7

Wheel—39 yds. C to 1 yd. lace. Ch 11.

First row: Tr in 8th from needle, ch 2, sk 2, tr in next, ch 7, turn.

Second row: Picot (s st in 5th from needle). Ch 2, tr over tr and in each of next 3 st (4 in all, making 1 blk) ch 2, sk 2, tr in next st, ch 5, turn.

Repeat these two rows.

tr, repeat from *in next tr, repeat twice over the ch and once in each of next 2 tr, tr in next tr, ch 1, tr in 3rd of 4 ch, ch 4, turn.

Fifth row: Tr over tr, ch 2, skip picot, tr in next st, ch 3, turn. Repeat for length, ending with 4th row.

Edging No. 3

Bell Edge—54 yds. C to 1 yd. lace.

First row: Ch 7, tr in 1st ch made (in repeating, the tr is made over tr to form 1 sp), ch 5, over the tr work 1 group (thread over twice, 1 d tr, leaving 2 loops on needle, 3 more d tr, leaving additional loop after every st, then remove the 5 loops two at a time), ch 2, 1 tr tr (thread over 3 times) in base of 1st tr (in repeating the design make 1 tr in previous ch 5 instead of the tr tr), ch 7, turn.

Second row: Picot (s st in 5th from needle), ch 2, skip group, tr in 5 ch, ch 5, tr in tr at base of group, ch 2, skip 2 ch, tr in next ch, ch 5, turn. Repeat these two rows.

Edging No. 4

Cluny Shell—57 yds. C to 1 yd. lace. Ch. 9.

First row: Skip 7 ch, tr in each of next 2, ch 7, turn.

Second, third and fourth rows: Tr in each of 2 tr, ch 7, turn.

Fifth: Tr in each of 2 tr, and 10 tr over 7 ch, s st in 1st ch 7, ch 6, turn.

Sixth row: S st in 4th st from

The Colt "Gas Well" is placed at a convenient point in the yard

"—and the extra egg money more than paid for our plant"— writes a pleased farmer who lighted his henhouses last winter with Union Carbide Gas from his Colt "Gas Well"

Poultry experts unite in insisting on plenty of sunlight in the henhouses. They attribute to sunlight the tonic effect of maintaining the birds in maximum production condition, and the power to dispel the majority of poultry diseases. Exhaustive tests prove Union Carbide Gaslight to be the nearest approach to sunlight. This light in the henhouses will provide your laying birds with the nearest natural illuminant for increasing production and the other valuable effects of sunlight.

Poultry research discovers the hen of tropical origin, of long sunlit days and short nights. Experiments have demonstrated the hen's digestive organism to be fashioned on the 14-hour plan—and 9 hours of winter daylight positively won't do, if you expect an egg a day and a contented healthy bird. Nature simply pulls a strike on you.

The farm hen has demonstrated beyond all question the fact that she is a dependable profit payer through the winter months (the period of high egg prices), when Union Carbide Gas from the Colt "Gas Well" lights the henhouses to make the necessary 12-to-14-hour working day. The extra hours of light will enable your hens to exercise and take in the food reserve needed for more eggs.

A Colt "Gas Well" on your farm

The Colt "Gas Well" is installed in the ground—in the yard. From it comes Union Carbide Gas, made automatically as needed. It will light your house and barn. It will cook your meals. It relieves the drudgery of washday, and keeps the iron hot. Besides converting the henhouse into a source of profit, the Colt "Gas Well" has become a necessity for the farm home.

Colt "Gas Well" users are increasing in vast numbers. Get your Colt Lighting-and-Cooking Plant now—be ready when the time comes for increasing egg production with artificial sunlight—Union Carbide Gaslight.

Reviewing the Latest Eastern Markets and Prices

WHERE NEW YORK GETS ITS BUTTER

HERSCHEL H. JONES

IT may be surprising to many New York State dairymen to learn that in the month of June, 1923, New York City received butter in the following quantities from the following principal States in order of importance:

Minnesota	11,344,206
Iowa	6,540,802
Illinois	3,605,662
Nebraska	2,080,168
Wisconsin	1,535,920
Michigan	1,132,934
Indiana	1,104,151
New York	837,132

The total receipts at New York in the month of June were 31,164,885 pounds, of which New York State supplied only one-five hundredth part.

In the receipts of cheese, however, New York State took a more prominent position, being second only to Wisconsin. Out of total receipts at New York in the month of June of 5,207,483 pounds of cheese, 2,246,812 pounds came from Wisconsin and 1,630,547 pounds from New York State.

BUTTER MARKET ACTIVE

There was a large volume of buying of butter last week in the New York wholesale market. In addition to local demand for consumption and storage there was considerable business for out-of-town shipment. Creamery extras (92 score) sold principally at 38c per lb., which was only ½c lower than a week previous.

There were 2,567 casks of Danish butter received, which sold at 39 to 39½c, duty paid.

Receipts of butter are running lower than at this time last year, but the total receipts at New York since January 1, 1923, are larger by 20,000 tubs than in the same period last year, and the quantity of butter on hand in cold storage at New York at the present time is about 2,000,000 lbs. in excess of last year. The total quantity on hand in the four largest markets of the country, however, is 3,000,000 below last year at the same time.

New York State whole milk American cheese flats are still held firmly and the market is steady with very little trading at prices above a range of 24 @ 25c. Wisconsin cheese markets are a little weaker. Prices are not much lower than previously.

FANCY EGGS IN LIGHT SUPPLY

Nearby hennery white eggs were in lighter supply last week and the market was quite firm on the best qualities. Prices advanced gradually and on July 5 selected New Jersey hennery white extras were quoted at 44c per dozen, and other nearby selected white extras at 41 @ 42c. All except seriously defective eggs moved more easily at advancing prices and the prospect is for a continued good market on all really fancy fresh eggs.

The present wholesale prices are practically at the same level as last year at this time. In July, 1922, hennery white extras graded to uniformity went up to 49c top price by the end of the month and average extras up to 40 @ 42c. From July 1 right on up to the second week in November the market for fancy nearby henneries advanced steadily, the top price for graded extras reaching 94c on November 8. Whether this steady advance will be repeated this year or not is uncertain, but there will undoubtedly be a real scarcity of the fanciest eggs in the next few months and the poultrymen who can get eggs of fancy quality to market will be well rewarded.

The bulk of sales of good quality nearby eggs last week probably were within a range of 28 @ 34c, with better quality selling at 35 to 39c.

The best scientific knowledge on egg production in the country and the best trained minds in the egg industry are centered on the production of quality eggs for the New York market. The standards of quality established by this competition are not easy to attain.

DARK YOLKS CAUSE KICKS

No one thing causes more complaints among buyers against the majority of average nearby eggs than dark yolks.

The discriminating trade in New York that is willing to pay high prices for quality, demands a light yolk egg, and it is not at all uncommon for them to be willing to pay as much as 4c more per dozen for eggs that have light yolks, like the Pacific Coast eggs, compared with eggs of the same quality otherwise but with dark yolks. However undesirable it may be from the standpoint of giving the hen a well-rounded diet, it is essential from a marketing standpoint for the nearby producer of fancy eggs to feed his hens in such a way as to get light yolks, if he wants to get top prices.

FOWLS SELL WELL

For the first time in some weeks, there was an active demand and strong market for fowls last week. The usual Fourth of July demand for broilers was sufficient to move the very liberal supplies that came in, but prices were

white and green, prime, best \$3.75 @ 4, fancy \$4.25 @ 4.50, fair stock \$2.50 @ 3, culls \$1.25 @ 1.75; BEANS—green per bu. bag, "Round" \$2.75 @ 3.25, flat \$2.50 @ 3, wax \$2.75 @ 3.25, fancy \$3.50 @ 4; BEETS—per bunch, best, 5 @ 6c, ordinary and small 4 @ 4½c; CAULIFLOWER—per slat bbl., best \$4 @ 4.50, fair stock \$3.25 @ 3.75, No. 2's \$1.50 @ 2.50; CARROTS—per bunch best 3 @ 4c, small 2 @ 2½c; CABBAGE—per head "white" 8 @ 10c, fancy large 12c, per slat bbl \$2 @ 2.25; KALE—per slat bbl. \$1 @ 1.25, few sales \$1.50; LETTUCE—per crate (32 qt.) 50 @ 75c, fancy few small sales \$1; ONIONS—per bunch best 3½ @ 4c, fancy, young, few sales 4½, ordinary 3c; PEAS—per bag (bu.) best \$1.25 @ 1.50, poor 75c @ \$1; RADISHES—per bunch, red and white tip best 3 @ 3½c, ordinary 2½c, black 4 @ 5c, white 2 @ 3c; RO-MAINE—per crate (32 qts.) 50 @

white 51½ @ 53c; ordinary white clipped 51½ @ 52½c.

Chicago—Corn, No. 2 white 82½ @ 82¾c; No. 2 yellow 83¼ @ 84c; oats, No. 2 white 42 @ 43¼c; No. 3 white 40¼ @ 43c; barley 60 @ 69c.

HONEY PRODUCTION LIGHT

Beekeepers generally all over the country report, according to the United States Department of Agriculture, a poor season for honey production. The West and Southwestern report very poor prospects and very light old crop honey on hand. Vermont is about the only State that reports an excellent outlook. In New York and Pennsylvania, the hot weather has dried up the nectar in clover blossoms.

A few sales are reported in the Northern States of white clover at 12c lb., in 60 lb. cans or 14c wholesale in small pails. The New York City market is very dull, and demand is light with very little trading.

Quotations From Eastern Markets

The following are the prices at which farm products of special interest to eastern farmers sold on July 5:

Eggs, Nearbys (cents per dozen)	New York	Buffalo	Phila.
New Jersey hennery whites uncandled, extras...	44
Other hennery whites, extras.....	41 @ 42
Extra firsts.....	36 @ 38	29 @ 30	28
Firsts.....	32 @ 35	25
Gathered, whites, first to extra firsts.....	32 @ 37
Lower grades.....	29 @ 31
Hennery browns, extras.....	33 @ 36
Gathered browns and mixed colors, extras.....	28 @ 32	27 @ 28
Pullets No. 1.....	28 @ 30
Butter (cents per pound)			
Creamery (salted) high score.....	38½ @ 39	41 @ 42
Extra (92 score).....	38	39 @ 40	38½
State dairy (salted), finest.....	37 @ 37½	37 @ 39
Good to prime.....	35½ @ 36½	30 @ 36
Hay and Straw, Large Bales (per ton)	U. S. Grades	Old Grade Standards	
Timothy No. 2.....	\$21 @ 23	\$19 @ 20	\$22 @ 23
Timothy No. 3.....	18 @ 19	19 @ 20
Timothy Sample.....	12 @ 15
Fancy light clover mixed.....	25	21 @ 23
Alfalfa, second cutting.....	27 @ 29
Oat straw No. 1.....	10 @ 12
Live Poultry, Express Lots (cents per lb.)			
Fowls, colored fancy, heavy.....	26	23 @ 24	26 @ 27
Fowls, leghorns and poor.....	24 @ 26	21 @ 22	21 @ 22
Broilers, colored fancy.....	42 @ 45	45	53 @ 55
Broilers, leghorn.....	35 @ 37	32
Live Stock (cents per pound)			
Calves, good to medium.....	11½ @ 12½	12½ @ 13
Bulls, common to good.....	4 @ 4½	4 @ 5½
Lambs, common to good.....	10 @ 14	14 @ 16½
Sheep, common to good ewes.....	2½ @ 4½	5 @ 7
Hogs, Yorkers.....	8 @ 8½	8 @ 8½

rather in buyers' favor. Some broilers had to be carried over the Fourth of July, but were sold later. The best Boston broilers on July 5 brought 45c and the best white leghorn 38c, while most of the stock sold at lower prices. On July 5 average leghorn broilers were quoted at 35 to 37c and small, 30 @ 33c.

Express shipments of live fowl sold chiefly at 26c per lb. for either white leghorn or colored; some of the poorer white leghorns sold at 24 to 25c.

GOOD PRICES FOR POTATOES

A short supply of new potatoes caused prices for Eastern Shore Virginia potatoes to go up to \$7 per bbl. last week. The first new potatoes from Long Island and from New Jersey reached the market last week, which is unusually early. The new Long Island cobbles were in good condition and sold at \$6.50 per bbl., but the N. J. potatoes were small and less desirable.

DULL MARKET FOR PEAS

Very heavy receipts of green peas at New York last week caused a decline in prices and a dull market. Thirty-three carloads arrived from State sections on Friday alone. Early in the week the best peas brought a top price of \$2.50, but the range later was from \$1 @ 2.25 per bu. basket, depending on quality, mostly around \$1.50.

JERSEY SWEET CORN "IN"

In the farmers' public markets at New York last week, New Jersey sweet corn made its first appearance and sold at 3 @ 4c per ear. Long Island and New Jersey cabbage sold readily. The following prices represent sales by farmers to jobbers and retailers on July 5:

ASPARAGUS—per dozen bunches,

75c, per slat bbl. \$1 @ 1.50; SPINACH—per 32-qt. crate Savoy \$1.75 @ 2, New Zealand 75c @ \$1.

PLENTY OF CHERRIES

Shipments of cherries, particularly white sweets, were so heavy that the market became weaker last week. Late deliveries kept many shipments from reaching the best early morning market and necessitated carrying them over. The crop of white sweets has been especially large in Columbia County this year. The sour varieties will form a larger portion of the shipments from now on and there is also a large crop of them.

The following wholesale prices represent the market on July 5: CHERRIES—per qt., red sour, Montmorency 10 @ 15c; black sour, 20c; in 4-qt. baskets, sweet varieties, 50c @ \$1.25; GOOSEBERRIES—per qt., large 18 @ 20c, medium 13 @ 15c, small 10 @ 11c; RASPBERRIES—per qt., red best, mostly 10 @ 12c, fancy 14 @ 16c, ordinary 5 @ 8c; CURRANTS—red, per qt., mostly 12 @ 14c, few small sales fancy 15 @ 16c; ordinary 10 @ 11c.

GOOD HAY IN DEMAND

Receipts of hay fell off last week and the market was firmer on top grades. Poor hay was dragging. Most of hay received was No. 3 or No. 4. Fairly large supplies reported in transit, which might cause decline later. No. 1 Timothy was quoted July 5 at \$26 per ton.

CASH GRAIN QUOTATIONS

Cash grain quotations July 6 were as follows:
New York—Corn, No. 2 yellow \$1.00½; No. 2 mixed \$1; No. 2 white \$1.00½; oats, No. 2 white 53c; No. 3

The United States Department of Agriculture has just established official standards for wool grading. There are seven grades, as follows: Fine, ½ blood, ¾ blood, ¼ blood, low ¼ blood, common and braid. The properties considered, after several years' investigation and study of the standards, are first, diameter of fiber; second, length of fiber; third, spinning quality of fiber, fourth shrinkage of wool, the fineness of fiber being regarded as basic.

Save the Potato Crop

(Continued from page 23)

the reasons why Long Islanders are not taking to dust more rapidly."

That man just about spoke a volume in those few words. I have been in the southwestern corner of Livingston County and seen potatoes growing on hilltops that tax a man's climbing ability, let alone a team of horses. To get a tank of liquid spray up there is next to impossible and to go back and forth for each refilling is quite impracticable.

I have in mind two growers in particular, George Mehlenbacher and his neighbor, Gibson, of Wayland, N. Y., who bought a duster in partnership and solved the problem of hauling spray materials up steep hillsides. One trip up the hill carried enough dust for the whole field. Another advantage they found in their duster was that they could easily cover a field in the morning before the dew is off the plants and before hay was dry enough to be hauled into the barn. Of course, these men had an acreage that warranted the purchase of a duster, but where acreage was low more men can get into the ring.

But whether you dust or spray, the main thing is to get on the poison and the fungicides to check plant losses. One of the best potato growers that I know, G. T. Powell, of Glen Head, Long Island, has been conducting spraying tests for several years and his tests bear out the statement that the cost of spray and its application is more than paid for by the increase in returns. He has been demonstrating not only that it is possible to control disease, but that it is a paying proposition.

Putting Up Summer Butter To Keep It For Winter Use, Pasteurize the Cream

SWEET cream, pasteurization, and proper packing are essential to the successful making and storing of summer butter for use the rest of the year.

The cream must be perfectly sweet. The buttermilk from cream in the proper condition for making storage butter is as sweet as fresh skim milk. If the cream is allowed to sour, a strong and perhaps a fishy flavor may develop in the butter.

Sweet cream must be pasteurized for two reasons:

First, the butter will keep much better if most of the bacteria in the cream are killed by heating; second, sweet cream is difficult to churn if its sticky quality, or viscosity, is not broken by pasteurization.

Earthenware jars are the best containers in which to store butter, but wooden tubs may be used. The container must be scalded thoroughly and cooled immediately before butter is packed in it. The surface of the butter, after it is packed in the container, should be covered with a white cloth that has been made practically sterile, or free from bacteria, by boiling in clean water for a few minutes. The diameter of the cloth should be about two inches greater than the diameter of the jar. The cloth should be covered with a layer of salt about one-sixteenth of an inch deep, to keep the surface of the butter from spoiling. The cloth is merely to aid in lifting the salt from the butter when a portion of it is taken out for use.

Care of Utensils

The condition of a workman's tools has a definite relation to the quality of his work. In the same way there is a direct relation between the care of the dairy utensils and the quality of the butter made. All dippers, strainers, pails, cans and tinware should be not only carefully washed, but thoroughly scalded with boiling water. This process will kill most of the bacteria and will also dry the utensils and thus prevent rusting. Ladles, the butter bowl or board, the butter printer, and all wooden utensils not only should be thoroughly washed and scalded after being used, but should be soaked in boiling water before being used, in order to prevent the butter from sticking to them. The churn must be kept sweet; this cannot be emphasized too strongly. Under normal conditions thorough scalding after each churning is sufficient to keep it in good condition. In case the churn has a musty odor, it should be filled with a saturated solution of lime water. This may be made by slaking burned lime, adding water, stirring the mixture thoroughly and allowing it to stand a few hours. After the lime has settled, the clear lime water may be dipped off and put into the churn. Several new supplies of lime water may be made by adding more water to the lime, stirring the mixture thoroughly, and allowing it to settle as in the first case. The lime water should be placed in the churn as soon as it has been scalded after using, and allowed to remain until the churn is used again.

Gravity Separation Not Efficient

The gravity method of separation is not so efficient as centrifugal separation, for two reasons: First, more fat is lost in the skim milk; second, the cream is thinner, and consequently it is often difficult to churn. Where no separator is available the following method may be employed: When making butter on a fairly large scale, two or more 40-quart milk cans should be used as containers. Immediately after the milk is drawn it should be placed in these cans in the cooling tank and stirred until it is 50 degrees or less in temperature. After the milk has stood for approximately 48 hours, the cream should be carefully skimmed off with a shallow dipper. If the milk stands for a shorter period, a high percentage of fat will be lost in the skim milk.

Low temperatures must be maintained throughout the holding period in order to keep the cream sweet. About 10 or 12 pounds of cream for churning should be skimmed from the 40-quart can of milk; then about a gallon of

milk should be skimmed into another pail. This latter skimming will contain about the same percentage of fat as whole milk, and may be used as such in the home. When this method is followed, the skim milk will contain less fat than if one skimming is made, the cream will be richer in fat and will therefore churn more readily. In some cases shotgun cans may be used to better advantage than 40-quart milk cans.

How to Pasteurize the Cream

Cream may be pasteurized on the farm in the following way: Place a wash boiler partly filled with water on the stove. Set the shotgun cans or the pail containing cream in the water and allow it to remain over the heat until the temperature of the cream reaches 145 degrees. Stir the cream gently, not vigorously, so that it will heat uniformly. Move the boiler to the back of the stove, and hold the cream at the temperature of 145 degrees or a few degrees higher for 20 or 30 minutes. If the temperature of the cream reaches 160 degrees, the flavor of the butter will not be injured.

Cool the cream to 50 degrees or lower, and hold it at this temperature for at least 3 hours. Usually in creameries, it is held at this temperature overnight. Stir the cream gently so that it will cool more rapidly.

If the butter is packed solidly in a stone jar, it should be covered with a white cloth and a layer of salt. If printed butter is packed for storage, the wrappers should be held in place by white cord passed around each print, both lengthwise and crosswise. The prints should be packed in a stone jar that has been scalded carefully and cooled, and a large plate should be placed on the butter and weighted down with bricks or stones that have been cleaned thoroughly and scalded.

Finally the butter should be covered with a saturated solution of brine made by adding salt to water in the proportion of one pound of salt to four pounds of water. A 10-gallon jar will hold 50 pounds of butter in prints with about an inch of brine over the top surface. An extra supply of brine should be kept on hand in fruit jars or other sealed containers, and added to the butter jar as the prints are removed or as the brine in it evaporates.

Butter must be held at moderately low temperatures. The cellar is the best place for storing butter on the farm, but the jar must be covered properly so that the butter cannot absorb odors of fruits and vegetables stored near it.

FARMERS' BULLETINS FOR THIS TIME OF YEAR

Recent bulletins of interest to farmers which may be obtained free of charge by writing the Division of Publications, United States Department of Agriculture, Washington, D. C., are as follows: Farmers' Bulletin 707, The Commercial Grading, Packing and Shipping of Cantaloupes; 766, The Common Cabbage Worm; 842, Methods of Protection Against Lightening; 850, How to Make Cottage Cheese on the Farm; 871, Fresh Fruits and Vegetables as Conservers of Other Staple Foods; 900, Homemade Fruit Butters; 943, Haymaking; 959, The Spotted Garden Slug; 984, Farm and Home Drying of Fruits and Vegetables; 1007, The Control of the Onion Thrips; 1112, Culling for Eggs and Market; 1115, Selection and Preparation of Fowls for Exhibition; 1145, Handling and Transportation of Cantaloupes; 1211, Home Canning Fruits and Vegetables; 1225, The Potato Leafhopper and Its Control; 1246, The Peach Borer—How to Prevent or Lessen Its Ravages; 1258, Webworms Injurious to Cereal and Forage Crops and Their Control; 1266, Preparation of Peaches for Market; 1290, The Bulk Handling of Grain; 1310, The Corn Earworm.

Puts 3 H-P Engine on Your Place For Only \$18.55

Ed. H. Witte, Famous Engine Manufacturer, Makes Startling Offer On New Witte Throttling Governor Engine.

Farmers, now more than ever, appreciate the need of power on the farm and know they can make \$500 to \$1,000 additional profit a year with an all-purpose engine.

Ed. H. Witte, nationally-known engine manufacturer, has announced a new 3-horse power engine which burns either kerosene, gasoline, distillate or gas with a special regulator which enables it to operate all the way from two to four and one-half horse-power.

This new WITTE ENGINE has revolutionized power on the farm as it handles practically every job with ease at a fraction of the cost of hired help. Easily moved from one job to another, it is trouble-proof and so simple that a boy can operate it.

To introduce this wonderful new engine to a million new users Mr. Witte has arranged to put it on any place for a 90-day guaranteed test. Since it costs only \$18.55 to take advantage of this sensational offer Mr. Witte confidently expects every progressive power-user to soon be using a WITTE. Every reader of this paper who is interested in making bigger profits and doing all jobs by engine power should write today to Mr. E. H. Witte, 1803 Oakland Ave., Kansas City, Mo., or 1803 Empire Bldg., Pittsburgh, Pa., for full details of this remarkable offer. You are under no obligations by writing.

A FREE TRIP to New York City

FOR EVERY BOY AND GIRL

between the ages of 12 and 21 who sells \$50.00 worth of subscriptions for American Agriculturist between now and August 22, 1923. This offer is open only to boys and girls living in one of the Middle Atlantic States or the New England States.

What the Trip Will Include

All contestants qualifying for the trip will have all their traveling expenses paid to and from New York and also all expenses for the two days they are our guests in New York City, August 29 and 30.

During the two days' stay in New York City the program will include a trip to one of the leading theatres, a visit to the Museum of Natural History, the Bronx Zoological Gardens, a Sight Seeing Bus Trip around New York, a visit to the New Markets and Water Front, the Woolworth Building, a trip on board an ocean going liner and as many other extra trips we can find time for in the two days.

New York City is the greatest city in the world and every young American should take pride in visiting this wonderland. You may not want to live in New York, but you have only half lived until you have visited it and seen its many tremendous buildings, beautiful parks, museums, famous subways, etc.

Letter From One of The Boys Who Visited New York At Our Expense Last Fall

"I wish to thank you for the good time you gave me while I was your guest in New York on the free trip which I won getting subscriptions for the American Agriculturist. "The first day we were in New York, we went to the Bronx Park. While there, we saw all kinds of wild animals you could think of.

"In the afternoon we went to the New Markets and Water Front, where we saw all kinds of live stock and fowl. At the Water Front we saw an ocean liner leaving for South America, also battle ships and many ocean-going liners. Then we went to the top of the Woolworth Building, which is 60 stories, and 792 feet high—the tallest building in the world. While up in the top we could see the Brooklyn and Queensboro Bridges, Manhattan Bridge; also lower Manhattan and a fine view of New York.

"From here we went to the Aquarium, the home of all kinds of fish, seal and walrus. We had a fine view of the Statue of Liberty. From here we went over to the Custom House and New York Stock Exchange and Wall Street. We saw a number of large buildings, such as the Bankers' Trust Company Building—which is 39 stories, and 540 feet high—Merchants' National Bank, New York Clearing House and many other large buildings, such as the Singer Building—which is 49 stories, and 724 feet high—the Flatiron Building, Metropolitan Tower, Pennsylvania Railroad Station, New York Public Library, and the New York Post Office.

"That night we went to the Hippodrome, which is the largest theatre in the world.

"The next day we went to the A. A. Building, where we saw how the A. A. was printed. We then went on a sight-seeing bus trip around New York. In the afternoon we went on another bus to Riverside Drive. We saw the Soldiers' and Sailors' Monument and Grant's Tomb, with a fine view of the Hudson River and The Palisades. We traveled on surface, subway, and elevated trains. We also visited the Museum of Natural History.

"All in all it was a wonderful trip."
(Signed) FREDERICK JAMES HATHAWAY
(Age 14)
Schuylerville, New York

You Are Sure of Being Rewarded

If for any reason you should discontinue getting subscriptions before reaching a total of \$50.00, we will pay you a cash commission of half the amount you have sent us for subscriptions, provided you have sold at least \$10.00 worth of subscriptions.

Boys and Girls! Register Now

Don't take any chances of missing this wonderful trip. Fill out the coupon below immediately so that we can register you as one of the contestants and send you necessary supplies free of all expense. But don't wait for any supplies. Start getting subscriptions now—this very day.

Remember the trip is not at all competitive, so that if you sell 50 subscriptions for American Agriculturist between now and August 22nd, 1923, you will win one of the free trips to New York City, no matter how many others qualify for the same great treat.

Mail This Coupon At Once

MANAGER FREE TRIP BUREAU
American Agriculturist
461 Fourth Ave., New York City

Please count me in on the free trip to New York City. Send me necessary sample copies and other supplies together with instructions. I will do my best to sell at least \$50 worth of new or renewal subscriptions for American Agriculturist before August 22. In case I fail to get \$50 worth of subscriptions it is understood that you will pay me a cash commission amounting to half of the money I receive for American Agriculturist subscriptions, provided I send at least \$10 worth of subscriptions.

NAME.....

ADDRESS.....

.....

.....

HOW TO GET THE FREE TRIP

All that is necessary to get all your expenses paid on this trip to New York City is for you to sell \$50.00 worth of subscriptions for American Agriculturist. Send your orders in each week. No orders will count if mailed later than August 22nd.

In order to reach your goal of \$50.00 worth of sales quickly, you may sell five years for \$3.00 or three years for \$2.00. Of course, you may also sell one year for \$1.00. It is clearly to your advantage to get the long-term subscriptions because you require much less of them. For instance, 25 three-year subscriptions at \$2.00 each will be easier to secure for most contestants than 50 one-year subscriptions at \$1.00. The big point to remember is that your total subscription sales must amount to \$50.00 in order to entitle you to the free trip. Renewals count the same as new subscriptions.

ISAAC PHILLIPS ROBERTS

"The Wisest Farmer I Ever Knew"

"The Wisest Farmer I Ever Knew"

In Commemoration of Isaac Phillips Roberts' Ninetieth Birthday

EDITORS NOTE.—Probably no farm paper has ever carried in one issue the writings of so many great men as are found on these pages. The idea of a memorial number to Professor Roberts should be credited to Jared Van Wagenen, Jr., who was one of his students.

"One of Roberts' Boys"

By Jared Van Wagenen, Jr.
Farmer, Lecturer, Writer

ISAAC PHILLIPS ROBERTS—Farm Boy—District School Teacher—Country Carpenter—Farmer—Teacher of Agriculture—Director of the Agricultural Experiment Station at Cornell—Dean of the New York State College of Agriculture—Representative Extraordinary of the American Farmer.

The simple, inspiring story of Professor Roberts' life has already been put into permanent form. After he became what men call old, he wrote his own life "The Autobiography of a Farm Boy." It is a book of singular intimacy and charm. In it he traces in outline his own career from his birth in that pioneer home in the Finger Lake Country—through the struggles and vicissitudes of his early life, on through the years of recognition and triumph, not forgetting his serene sunset as the evening draws on and he peacefully awaits the close of "a long day and a good day" in his California home.

I have no wish to quote at length from this story as he has written it. It is not only a record of what he did—it is also an illuminating treatise on what were the pioneer conditions in Western New York almost a century ago. It is filled also with that rare whimsical humor and that matured wisdom and that genial philosophy which made him beloved of all that great company of "boys" who came under his influence. As I read it to-night, a generation is rolled back and again I am a happy student boy and I see him come into the little, old, primitive lecture room on the south side of the north corridor of Morrill Hall, and once more I listen to his musings and his teachings for an hour as of old, for he writes even as he talked.

Then just the briefest outline of his career. He begins his autobiography with one of his own characteristic sentences. He was born on July 24, 1833 "at daybreak of a fine harvest morning," with other light touches in similar vein. The place was East Varick, in the County of Seneca, on the west shore of Cayuga Lake.

He came of good stock. His grandfather had migrated hither from New Jersey some twenty-one years earlier. He describes this worthy man as combining the three-fold dignities of "a poet, a speaker and a farmer," a man prominent in the church, the school and the counsels of the pioneer neighborhood, a godly man withal, and a leader of

By MEN WHO KNEW HIM

men. Such was the good seed from which he sprang. His forebears were at least rich in health and character and ideals, and they were fortunate in pitching their tent in a fat land.

His story is full of illustrations of the rudeness, the simplicity of the life and yet of the almost prodigal abundance of simple foodstuffs in that time, for the rich earth fairly teemed with abundance when once the

came to him, and in a prairie schooner together with his young wife and a sixteen-month old baby he made the long trek to Mount Pleasant, Iowa, crossing the Mississippi River on the ice. It was a journey of several weeks and it is characteristic of the habit of thought of the man, that while most of the emigrants pressed forward seven days a week, he rested his folk and horses on the Sabbath, and that very soon after arrival at Mount Pleasant he found himself Superintendent of the first Sunday School. Here in his new home, according to what had become almost his custom, he carpentered and taught school and farmed, but always the call of the farm was loudest. Unconsciously he was fitting himself for greater things.

He was thirty-six years old before the call came. He tells how one day in 1869 he was giving the finishing touches to the cupola of his fine "New Barn," which was "so important to him that he felt it ought to be spelled with capital letters" when a red-headed man appeared at the top of the ladder and a voice said: "Young Man—Come down—I have better work for you." It was an invitation from one of the trustees to become Farm Superintendent of the Iowa Agricultural College. At first he answered after the fashion of Nehemiah on the walls of Jerusalem "I am doing a great work and I cannot come down." With reluctance he allowed his name to be presented, but declined to furnish any letter of reference. He was first made Farm Superin-

tendent, but less than a year later was elected Professor of Agriculture—this son of a taught farm boy.

Three years later the newly established and almost still-born College of Agriculture at Cornell came to a crisis. Professor McCandless—a young Irishman, especially imported to fill that position, had proved a most dismal failure, and some one suggested the name of the rising young teacher of Iowa. In answer to an invitation he came back to New York and on the 1st of Day of 1873 he began a return journey which brought him back to the beautiful lake of his birthplace, and within thirty years of his birthplace, he did his great monumental enduring work—a work that filled thirty full, fruitful years.

Others better qualified than I have written of this man and of the way in which he has set his mark on our agricultural life. I count myself fortunate in that I may boast of having been one of "Roberts' Boys."

I knew him not as a colleague as did Professors Wing and Stone, but I knew him as a disciple—a very reverent a devout disciple—knowing him as a Master. I came under him when he was in the full maturity of his rich prime. College years are golden years—there are none others

He Prepared For Change

"ALL things," said the Buddhist philosopher, "which exist in time must perish. Even unto a grain of sesamun seed, there is no such thing as a compound which is permanent. All are transient, for in nature there is no uniform and constant principle."

Most men living entirely for the present fail to realize that there is nothing permanent but change, and that the present all too soon will become a part of the past. The world, therefore, always owes a debt to that small number of men in every generation who make possible future progress by looking beyond the present to prepare their fellows to meet the needs and the demands of that New Day that time and change will surely bring.

Such a man was Isaac Phillips Roberts, whose ninetieth birthday it is our pleasure to commemorate with this issue of American Agriculturist. Professor Roberts was one of the few men of his day who realized that great and important changes were bound to come in American Agriculture. He knew that the rich soils of America would not last; he knew that time would bring new weeds, new insects, new plant and animal diseases, and new economic problems with which the future farmer would have to contend. He knew, in short, that changing conditions would surely change the status of agriculture requiring training, skill and education in the son which the earlier times had not demanded in the father. So, knowing these things, this great man, after farming it for many years, took his practical knowledge and his wonderful personality into the early struggling Agricultural College, and against tremendous odds of small equipment and large prejudices, he began to prepare men to meet successfully that New Day in farming which he knew was coming.

How well Isaac Roberts succeeded in the task he set himself is better told than we can tell it by the great and famous men who honor him by their words on these pages.—The Editors.

ax of the pioneer had let the sunlight in on the ancient forest floor.

In his boyhood he wrought at the Herculean labors of the pioneers varied by the teaching of school in winter. When he was twenty-one—a man grown—the spirit of his adventurous, westward-looking grandfather stirred within him and he went West to La Porte, Indiana. There he was by turns school-teacher, carpenter and farmer. Also he found opportunity to marry a daughter of the land—a union that was greatly blessed through many years, for children were born unto them and they two were lovers always. When he was about twenty-nine, again the Western lure—the urge of the pioneer—

The New York State College of Agriculture, showing the building named in honor of Professor Roberts. It is in the center of the group on the right

like them. He took us up to the mountain top and caused us to see the glories of the world of agriculture and the wonders of it. I confess that to some extent the vision has faded, that I have accomplished very few of the things to which I went forth with high resolves thirty-two years ago, but till I pass I shall hold dear the name and memory of that kindly friend and wise farmer and rich philosopher.

I yield to no one in my love and admiration for our wonderful College of Agriculture, seated proudly on her Hill by the noble Lake. She has a great Faculty of high minded, intensely trained teachers, but I am sure that not one of them will take it amiss when I say that on no man has Roberts' mantle fallen and that he left no successor. He was unique—a man called of God for his time.

He was in no sense a learned man judged purely by the standards of lifeless books. Indeed he never came to handle easily and accurately the severe technical vocabulary of science. But to have been one of the little group of boys who followed him over the farms and through the woods and fields was a wonderful privilege, for his laboratory was under bending skies and not within brick walls.

Many men have lovingly sought for a phrase which should set down and embody the spirit or the genius of this great Teacher of Boys. I, too, have thought upon it and I crave leave to borrow a phrase that came from the pen of another Disciple—Dean Bailey when he wrote "He was the wisest farmer I ever knew."

* * * *

Let His Own Works Praise Him

By A. R. Mann

Dean of the New York State College of Agriculture,
Cornell University

IT may be commonplace to remark that the present generation is the heir of all the generations which have gone before. The present achievements of men rest on the foundations laid in the past. The sounder and the more enduring the foundations, the more substantial and permanent the superstructure is likely to be.

The College of Agriculture in New York State has a very rich inheritance from Roberts, Bailey, and others, and its present character and ideals have their roots deep in the past.

Isaac Phillips Roberts was a practical idealist of the best sort. His ideals were clear and tangible and composed of solid stuff, free from vagaries and fancies. His sturdy, practical sense controlled his ideals and kept them within the area of accomplishment. He believed that the activities of the farm and the problems of agriculture had an educational content worthy of a place in the highest institutions of learning. Before the sciences had been greatly employed in interpreting the operations of Nature or in revealing her secrets, he undertook to organize an institution whose primary purpose should be the application of scientific methods and knowledge to the problems of agriculture, confident that in such application lay the way to a fuller mastery of the land and the crops and the animals, and to an

advancing country life. He recognized more clearly than was the custom of teachers of his time the educational values to be found in a careful study of the common, workaday things of the farm. He accepted no substitute for agriculture. He kept always before his students the necessity for actual

farm experience as a highly essential part of an agricultural education. "The way to learn one part of agriculture, and a most important part, is to do agriculture," he declared. "If students object to the toil of learning the fundamentals—without remuneration—then turn them out to grass and let them graze within the pasture of any other college which will adopt a maverick." He would bind together, in a working team, science and practice. It was a sound basis for the institution he would build and the service he would render.

By his clear vision of an educational program arising out of, yet saturated with, practical experience; his recognition of the necessity for scientific experiment and investigation; his ability to choose and inspire teachers; his unwavering courage in the face of all the difficulties and oppositions which could confront a new educational venture in a field too generally regarded as a mere manual occupation not requiring nor to be greatly aided by much learning; his insistence on the job, whatever it was, being well done; his forceful character; his realization of the human factor in agriculture, and the importance of a good farm home; and his sturdy morality and sensible philosophy, which pervaded and enriched everything he did—Roberts gave to the State and to the Nation a service and a program of guidance which have been far-reaching in their effects. He blazed trails and opened highways for agricultural progress.

The present staff and student body at the College do not forget Director Roberts. His life, work, and example provide the text for many a lesson.

His part in the development, not only of our own College, but also of agricultural education in America, was too important to be overlooked by those who have entered into his labors. Not only the people at the College, but also the farmers of the State and the Nation, are his permanent debtors.

When Director Roberts retired from the headship of the College of Agriculture, in 1903, after thirty years of devoted service, he went to join his three children in California. He settled first in Palo Alto,

where he built a home. He has since occasionally lectured at the farm school at Davis and at the school at San Luis Obispo, and has frequently been a guest of honor at farmers' meetings throughout the State. In his ninetieth year he is still able-bodied. While failing sight has made it necessary for him to give up reading and writing, he still retains his interest in the large national problems of agriculture and in the daily experiences of the farmer. He may now be addressed by his many old friends who may desire to gladden his ninetieth birthday anniversary, at Dwight Way End, Berkeley, California.

* * * *

The Art of Tickling the Soil

By H. H. Wing

Head of the Department of Animal Husbandry, New York
State College of Agriculture

IT was my privilege to know and to be intimately associated with Professor Roberts for more than fifteen years, and it is with pleasure that I accept your invitation to contribute to your celebration of his ninetieth birthday, and if what I have to say should be too reminiscent and intimately personal, I trust I may be pardoned, for others will pay tribute to his more distinguished public services.

My intimate acquaintance with Professor Roberts began in the fall of 1880 when the eight of us seniors assembled in the little lecture room in Morrill Hall to begin the course in "Practical Agriculture," five lectures a week and two afternoon practices. In these days of classes running into the hundreds with large lecture halls and elaborate equipment, when the students appear only as the lecture hour approaches and go out with a rush at the first stroke of the bell, it seems strange to speak of any intimate relation between professor and student; and as a matter of fact such intimacy is largely impossible much as it may be desired by both parties. We who are old-fashioned and perhaps too prone to look back upon the good old days, believe that this intimate acquaintance went far to make up for the lack of modern equipment and conveniences.

The little group of eight students and the professor was much like a family. The students knew one another and were not slow to rub up against each other's individual

Professor Roberts in his eighty-seventh year

The "Old South Barn," no longer standing, the first barn owned by the College, designed by Professor Roberts

eccentricities and opinions. They knew the professor and what would be required of them and best of all the professor knew the students and how to encourage the diffident and repress the too exuberant as when on one of the afternoon farm walks the "leg puller" of the class approaching the professor inquired solicitously as to the prospects of fruit in the college orchards. With the quizzical twinkle all will remember the reply came quickly. "Mr. Blank, is it possible

Are You Opposed to Prohibition?

WE state without danger of contradiction that the most important issue before the American people to-day is prohibition. The votes and letters which American Agriculturist is receiving, indicate so far that the majority of farm people are for prohibition and a strict enforcement of the Eighteenth Amendment. But the response so far shows that there are a surprisingly large number of farmers who are voting against prohibition. Moreover, some folks, not farmers are saying that many farmers talk prohibition and have hard cider in their cellars, thereby failing to practice what they preach.

The cities of the United States are mostly wet. Organizations and thousands of individuals are working to amend or destroy the Eighteenth Amendment. They certainly will succeed unless the farm people, who are the largest single class in favor of prohibition, take interest enough to stand up and be counted.

American Agriculturist, therefore, is urging you to send in your vote. A ballot is given on page 37. It contains only two questions. All you have to do is answer yes or no to both of them. Your name will be held entirely confidential if you so wish it. We are also asking the Grange and other local farm organizations to bring this matter up, vote on it, and send us the vote. Are you not interested enough in this tremendously important problem to vote yourself and also to get action from your neighbors and your local farm organization?

Use Our Market Service

WE hope that all of our people are paying special attention to the Market Page in every issue of American Agriculturist. We hope also that some thought is being given toward making arrangements for getting the radio market reports. We are putting these out four days a week in cooperation with the New York State Department of Farms and Markets and the American Telephone

and Telegraph Company's broadcasting station, WEAJ.

Herschel Jones, our market expert, who writes the Market Page, has had long years of intimate experience with the markets of New York City. Reading this Market Page each week will give you information as to prices and the trend of the markets, which will save you much money in the sale of your eggs, other poultry products, and other farm products which you have for sale from time to time.

We cannot help but feel that this page is the best market service that can be obtained from any source. We know also that our radio market reports furnished through WEAJ are very worthy of any efforts you can make to receive them. If you do not have a radio yourself, there is almost certain to be one in your neighborhood so that it would be possible for you to make arrangements to have the prices you are interested in telephoned to you by your neighbor who has a radio.

The Deserted Village

ONE Sunday afternoon a few weeks ago, we followed an old hill road leading back for miles from the main highway into the hill lands of a southern tier New York county. Fifty years ago farming and its allied industries flourished in those hills; to-day the woodchuck, the crow, and a few families of Polish people make only a precarious living there. Once there were several hamlets thriving with stores, churches, blacksmiths' shops and butter factories, living on the trade and patronage from the surrounding farms. But now the lonesome and vacant buildings in many of these hamlets remind one of Goldsmith's "Deserted Village."

Sweet Auburn! loveliest village of the plain,
Where health and plenty cheer'd the laboring swain,

How often have I loiter'd o'er thy green,
Where humble happiness endear'd each scene!
How often have I paus'd on every charm,
The shelter'd cot, the cultivated farm,
The never-failing brook, the busy mill,
The decent church that topt the neighboring hill,

These were thy charms, but all these charms are fled.

No more thy glassy brook reflects the day,
But chok'd with sedges works its weedy way;
Along thy glades, a solitary guest,
A hollow-sounding bittern guards its nest;
Amidst thy desert-walks the lapwing flies,
And tires their echoes with unvaried cries.
Sunk are thy bowers in shapeless ruin all,
And the long grass o'ertops the mouldering wall.

Within a few miles of where we stood, much of it within our sight, there lay probably a hundred thousand acres occasionally dotted by the good crops and buildings of some remarkably able farmer, but for the most part covered and dominated by the daisies and the devil's paint brush.

The valley lands of the East are in general still excellent; so good, in fact, that riding along the main roads and seeing the fine crops and buildings that border these roads, makes one forget that the hills are not so good. There are sections of the East where the hill lands are nearly, if not quite, as good as those that border the creeks and rivers in the valleys. But speaking in general, the acid, and often swampy, soils of our eastern hills are worn out. American farm families have reached a point where it is impossible to maintain a decent standard of living on them, and one wonders what is to be their future. Some of these lands are now being worked by Polish and other families of foreign blood, excellent people, able because of a large amount of help at home and a lower standard of living, to subsist for a time on a meager income. But even these people are beginning to leave, realizing the foolishness of working so hard

for so little, when high wages can be obtained in the cities.

Professor C. E. Ladd, of the New York State College of Agriculture, with some associates, is making a study of the eastern hill lands. No definite conclusions have been reached. Perhaps there are none, but it has been suggested that the present situation cannot continue and that one of two things must happen. The first is that some of this land probably should never have been cleared in the first place, and that it never can be farmed profitably; therefore, the only solution is to let it grow back into woods. The second remedy suggested is that the better parts of these worn-out hill soils can be reclaimed by the use of lime, drainage, acid phosphate and the production of clover. Some farmers are already doing this, but the difficulty with this plan is that the prices of farm products will not justify the heavy expense needed to reclaim this land.

Perhaps, though, the time will come when the farmer, through the large demand for his products in the city, and through cooperation, will obtain his proper share of the prices which come from this demand; and then the old hill lands will blossom forth again into fields of clover, renewed prosperity, and a happy farm people.

A Word For the Lightning Rod

THERE is quite a jump both in time and accomplishment from Franklin's discovery that lightning is electricity, to the experiment which was conducted the other day by a scientist in the employ of the General Electric Company, in which he actually produced lightning.

A room was especially prepared and a miniature village was set up in the room, well protected by lightning rods. When all was ready, the scientist pulled levers and made actual bolts of lightning crash across the room at the will of the operator, smashing into the buildings in the village. But the buildings were uninjured because they were well protected by the lightning rods.

The lightning rod business has had rather a stormy career with farmers. When first invented, they were readily accepted and put up on farm buildings. Then a time followed when a good deal of crookedness and trickery were used by the agents in charging more than the lightning rods were worth or in selling worthless ones. There was so much of this crookedness that in time farmers came to look with doubt upon the whole business and to chase the lightning rod agents off the place with the dog. The result was that for years few protectors were sold.

This was unfortunate because the lightning rod in itself, if made properly, put up right and well grounded, is almost certain protection against damage of buildings by lightning and the resulting fires. Of late years, farm people have come to realize this and more and more are equipping their buildings with this adequate protection against one of nature's forces, which causes tremendous damage and loss to farm buildings every year.

Quotations Worth While

I do not care so much, where, as with whom, I live. If the right folks are with me I can manage to get a good deal of happiness in the city or in the country. After all, a palace without affection is a poor hovel, and the meanest, but with love in it, is a palace for the soul.—ROBERT G. INGERSOLL.

* * *

Here's to the woman who has a smile for every joy, a tear for every sorrow, a consolation for every grief, an excuse for every fault, a prayer for every misfortune, an encouragement for every hope.—SAINTE FOIX.

Greatest Opportunity Lies in the East

A Radio Talk Broadcast From WEAf on June 18 at 6:50 p.m., Standard Time

MUCH has been written and spoken within the past few years in regard to the disparaging circumstances under which our farmers find themselves operating to-day. In some few instances, the picture may have been overdrawn, but in the greater number the true facts were adhered to and the speakers have been actuated by sincere motives in trying to find a solution to a very discouraging situation, which had its birth in the post-war period and which seems to have accepted the farmer as a bosom companion.

Out of the maze of remedies and panaceas which have been offered there are bound to arise two or three general ideas of sound character which can be broadly applied to restore agriculture to its proper balance among the industries.

It is certain that these remedies, to be assured of lasting success, will have to be predicated upon the operation of natural laws. Artificial schemes of adjustment, at the most, can only supply temporary relief and may in the end serve only to further disrupt the natural order of things and postpone complete restoration.

Our National Government has tried to bring some measure of relief to the farmer through legislation designed to increase his credit facilities. State governments have also legislated in his behalf, and the farmer himself has taken another hold and is attempting to better his position through cooperation and joint marketing of farm produce.

All of these agencies, and more, are having a good effect upon the situation and eventually, if they are based on sound economic principles, the operation of these influences in our farm life will gradually bring the farmer into his own once more.

In Pennsylvania, the last session of the General Assembly authorized the appointment of a Farm Commission to make a study of all phases of the Commonwealth's agricultural activity, with a view to offering recommendations for such legislation as will most quickly alleviate the present depression. The farm labor scarcity, high wages required to get labor in competition with nearby industries, the abandonment of large acreages and entire farms, the cheap price of farm products, heavy taxes on farm lands, and other factors that hurt the farmer's business and throw farming out of plumb with the other interests of the State, will be the subject of inquiry of this Commission.

Other States also are becoming more interested in the farmer's business and are doing what they think will have the greatest stabilizing influence upon this basic industry and assure the farmer of a reasonable profit on his products.

While all these agencies are at work in behalf of the farmer, it might be well to look ahead and take a glimpse at future prospects in our eastern agriculture. Farmers in the East do not feel so keenly the slump in agricultural values as do those in the western country where an excessive inflation has increased the oppressiveness of a decrease in farm product prices.

By FRANK P. WILLITS

Secretary of the Pennsylvania State Department of Agriculture

In the latter part of the nineteenth century, land values in the eastern section of the country were almost twice as great, and in some cases even more, than the land values of our heavy producing middle western States. In 1920, the tables were reversed, and in spite of the fact that there has been heavy deflation since, in 1923, these same middle western States are still burdened with land valuations that are considerably higher, and in some cases, more than twice as high as those prevailing in Pennsylvania, New York and other eastern States.

Farm land values in the East have risen, to be sure, and they have fallen since 1920, but the rise and fall has been normal and reasonably to be expected. Unlike the western farmer, we are not faced with the added discouragements of heavy deflation, and we are not unduly burdened with an abnormally expanded land valuation, which takes a heavier toll from the farmer's income. This augurs well for the future opportunities that exist in eastern farming.

The East is further favored in its nearness to the large consuming markets—markets which offer a convenient outlet for the greater part of our farm produce and which will absorb all farm products that measure up to requirements. The comparatively short haul to these thickly-populated centers, and the quick transportation facilities available, gives the East an advantage over those States which once offered considerable competition because of cheap land valuations.

The reversal in the value of land in the

respective sections of the country will also have a marked influence on our vacant farm situation in the East. With a gradual economic readjustment of the entire agricultural situation, many of these farms will again be brought into our farming operations and productivity increased.

There are many difficulties in the way of the eastern farmer, which are much the same for him as for the farm producer in any other section of the country. But as soon as an adjustment has been made and the farmer has been assured of an adequate return on his investment, when agriculture returns to a normal position among the industries, the opportunities of eastern farming, with markets close to the producing centers and with everything in his favor with respect to transportation requirements, should be well considered by the farmer.

First and foremost, the farmer is interested in his financial income. Farming is not a matter of sentiment with him. It is a business which requires all of his attention, day in and day out. As a business it should be the object of as much study and foresighted planning as is the store, the factory or the mill. Keeping accurate account of farm operations is no longer considered as a fad of the few. It is essentially a part and parcel of present-day farming; just as much as the automobile has become an indispensable unit in the commercial activity of the day.

This explains why cooperative marketing is gaining in prominence among producers, particularly in the distribution of specific farm commodities. It represents the application of business practice to the sale of a product, a study of the market for that product and the shortest way to that market. The old hit-or-miss methods of disposing of farm produce, dumping on the market as soon as harvested, with no thought of meeting market demand as to grade and with no knowledge of the market conditions, must be relegated to the past to keep company with the ox-team, the tallow dip, the flail and all other symbols of the old order.

Times and methods have changed and will continue to change. If our farmers in the East expect to take fullest advantage of the opportunities presented to them, they must keep abreast of the times. He must see that his product is graded and standardized to conform to the demand of the buying public. He will do well to find out in what way he can cater to the peculiar demands of the market nearest his farm, for that means less transportation. He must arrange in some way, perhaps through cooperation with his neighbors, to send his product by the most direct route to the consumer, thus reducing the spread between the price he receives and the price paid by the consumer. Further, he should study his business with an eye to cutting down burdensome overhead and removing the causes of waste, energy and expense. Thus, he can do his part in bringing farming back to its true position, and he will prepare himself for the opportunities that are his for the asking.

PROHIBITION BALLOT

OF THE
AMERICAN AGRICULTURIST

Are You for the Strict Enforcement of the 18th Amendment as It Now Stands? ☐ YES ☐ NO

Are You for a Modification of the 18th Amendment to Permit Light Wines and Beer? ☐ YES ☐ NO

Designate your opinion by placing an X in the square opposite Yes or No on each question. Sign your name and address. Your name will be kept *strictly confidential*.

Name.....

Address.....

Why You Should Vote

Do the American people want prohibition? The Wets emphatically say "No" and the Drys are even more emphatically for it. Both sides claim a majority. Which is right? What do farm people think about it? The opinions of farmers on any problem, if they will express them, go far in determining the outcome of a controversy.

American Agriculturist is taking a vote of farm families on the question of prohibition. It is a vital issue and whether you are for it or against it, be sure to vote in the spaces above. Mail this ballot to the American Agriculturist, 461 Fourth Avenue, New York City.

Get your friends to vote—More ballots furnished on application

HELLO

Diagram showing how the voice currents weaken in the long distance transmission and are restored by "repeaters."

Mastering Nature's Forces

Without the telephone "repeater," the entire electrical power available on the earth would not be sufficient to make trans-continental speech commercially possible. The three thousand repeaters now in use on Bell System long distance lines have increased the talking range of every telephone by thousands of miles. By making possible the use of smaller gauge wires, repeaters have kept down the cost of equipment by millions of dollars.

The repeater is only one out of scores of scientific developments of equal or greater importance in the advancement of telephone service. Bell System progress has been a continual encounter with seemingly impossible barriers, and a continual finding of new ways to overcome them. Each step in extending the range of speech has come only after years of study. Each important piece of telephone apparatus has had to be created for the need. Each working day this pioneering goes on. Nature is harnessed to a new duty and mechanical ingenuity improves the tools of service, as fast as science finds the way.

Not only is the Bell System daily conducting research within its own nation-wide organization, but it is studying the discoveries of the whole world of science for their possible application to telephone service. Only by such eternal vigilance has the United States been given the best and cheapest telephone service in the world.

4 TIMES Around the World with ONE OILING 100,000 Miles Without Stopping for Oil

An inventor who could develop an automobile, a railroad car or any other conveyance on wheels which would perform such a feat would be considered a wonder. But such is the record of regular accomplishment by the Auto-oiled Aermotor during the past eight years in pumping water.

Did you ever stop to think how many revolutions the wheel of a windmill makes? If the wheel of an Aermotor should roll along the surface of the ground at the same speed that it makes when pumping water it would encircle the world in 90 days, or would go four times around in a year. It would travel on an average 275 miles per day or about 30 miles per hour for 9 hours each day. An automobile which keeps up that pace day after day needs a thorough oiling at least once a week. Isn't it marvelous, then, that a windmill has been made which will go 50 times as long as the best automobile with one oiling?

The Auto-oiled Aermotor after 8 full years of service in every part of the world has proven its ability to run and give the most reliable service with one oiling a year. The double gears, and all moving parts, are entirely enclosed and flooded with oil all the time. It gives more service with less attention than any other piece of machinery on the farm. To get everlasting windmill satisfaction buy the Auto-oiled Aermotor, the most efficient windmill that has ever been made.

"The Wisest Farmer I Ever Knew"

(Continued from page 35)

that you have lived on this hill for four years and don't know whether there are any good apples in the college orchards?"

"Practical Agriculture" in those days included almost everything connected with the farm and farm life, and then some, and Professor Roberts did not hesitate to go further afield if it seemed necessary or desirable by digressing to point a moral or adorn a tale. As for instance, when emphasizing the necessity for the use of sound practical judgment he said, "Now boys, I hope you will all get married as soon as possible after you graduate, but when you go to pick out a girl, don't let your affections get too much the better of your judgment and above all don't take one with too thin lips, she is apt to have an uncertain temper."

The modern bespectacled Ph.D. professor with his highly specialized, scientifically classified and carefully outlined course in Agronomy, Thremmatology, Ecology or what not would look with consternation if not contempt upon the subject matter of that course in Practical Agriculture and its arrangement, and I would not for an instant give the impression that the teaching of agriculture has not been vastly improved in the last forty years. But there went out from Professor Roberts' teaching in the "early eighties" a score or more of young men who have been more or less successful in many branches of agriculture and farm life, and who count not the least of what their college training gave them, the hours spent in that little room in Morrill Hall and in the barns and fields of the "old" college farm with Professor Roberts.

One trait in Professor Roberts has always been particularly pleasing to me. Those who have read his books and heard him in the classroom and on the lecture platform, know that in the main his language was straightforward, simple and direct, but occasionally he liked to let his fancy run free and his language assume a more flowery form. My note book records in one of the very first lectures that "Cultivation is the art of using the plow and harrow to so tickle the minute particles of soil that the myriad mouths that have stored up the fertility of ages are set wide agape while the tiny rootlets filch from their stony teeth the golden setting."

While we honor Professor Roberts as a pioneer in agricultural education, a leader in agricultural progress and as a successful practical farmer; it is as a man that we of the early eighties now render our chief homage to him on the accomplishment of ninety years of well spent life. A man of deeply religious nature, inflexible moral standards, hard working and thrifty in practical affairs, with a cheerful optimism, ever ready to help others; we recognize in him the ideal type of American citizenship and trust that he may long enjoy Shakespeare's ideal,

"My age is as a lusty winter
Frosty but kindly."

As my own personal tribute there is no man except my own father for whom I have a more sincere affection than for Isaac Phillips Roberts.

A Gatherer of Friends

By W. H. Jordan

Formerly Director of the New York State
Experimental Station, Geneva, N. Y.

IT is eminently fitting that those of us who had personal contact with Professor I. P. Roberts in his days of activity should place on record an appreciation of the man and the great service he rendered to agriculture.

His influence as a man was notable. He had a sound philosophy of life, gained through a keen insight into men and affairs. We spoke of him as a philosopher. He was intensely human in his attitude toward young men and his counsel to them helped to direct their lives to the highest purposes.

His influence upon the agriculture of New York was uplifting. As one of the pioneers in agricultural education in the United States he labored under great difficulties, but he did much

to make the rural people understand what were their needs in education, and both in public sentiment and in his work at Cornell as a teacher he laid foundations upon which other men have built.

The young men who knew him as a teacher have not ceased to regard him with affection and the strong friendships which he garnered unto himself from among his associates in the agricultural field and from all who knew him intimately, have been abiding.

* * * *

An Everlasting Influence

By J. L. Hills

Dean of the College of Agriculture, University
of Vermont

DEAN ROBERTS, dean of deans in agriculture, by virtue of your green old age and of the firm foundations you laid during the days of your strength—we, who are of the generation which has succeeded yours, who have tried to walk in your footsteps and to follow the path you blazoned, salute you on the attainment of your ninetieth birthday. Your contribution to the training of the American country lad, to the creation of one of the strongest land-grant colleges in the country, to the upbuilding of American agriculture, has been notable. It will not live 90 nor 90 times 90 years; but from everlasting to everlasting in its fructifying influence.

We trust that you may be spared in health and vigor for years to come, and we rejoice in the realization of the fact, that though in the fulness of time your mortal body will return to the earth as it was, your soul will go marching on.

Agricultural Teaching in the Old Days

By W. A. Henry

Formerly Dean of the College of Agriculture,
University of Wisconsin

MEASURED by results Cornell University is the world's greatest pioneer in modern education. That great statesman and educator, Andrew D. White, its first president, brought up a classical culturist in the strictest sense, was big enough and broad enough to see the sciences were about to revolutionize the world's educational activities. Instead of fighting the movement as so many other educators did, he accepted the situation and gave science its proper place in the new institution of which he was president, and so Cornell University began its existence under unusually auspicious conditions.

In his efforts to get the best, Doctor White reached across the Atlantic and secured Doctor James Law, head of the Veterinary Department, a most worthy satisfactory selection as all old agricultural students will agree. His choice of a foreigner as Professor of Agriculture was unsatisfactory and Vice President Russell, acting as President, began a search for another to teach agriculture and operate the college farm. Professor W. A. Anthony of the physics department told President White that he knew of a man at the Iowa Agricultural College, from which he, Anthony, had come, that could at least keep the University farm fields fairly free from weeds, and so I. P. Roberts became Professor of Agriculture at Cornell University and thereafter weeds were less in evidence.

I was a student at Cornell during the dark days, 1876-1880, which followed its brilliant beginning under the masterful management of President White, undoubtedly the ablest, broadest-minded educator America has so far produced. The pinch of poverty was evident on every hand while I was a student, but the trustees and president never flinched or deviated from their high purpose. Dark Days? You may get some conception of the situation when you learn that more than once some of the trustees gave their individual checks toward meeting the winter's fuel bill.

In those days there were practically no text books on agriculture, and the instructor was compelled to carry on as best he could. And here was where

I. P. Roberts had the advantage over most instructors laboring under such conditions. He was of an intensely practical nature and had real farm experience instead of book instruction only. Pioneering has many advantages and Professor Roberts was a pioneer all his life, greatly to the benefit of his students.

This really great teacher had a hold on his pupils because he loved his vocation and, besides this, took a deep interest in each individual he was instructing—proud of those with strong minds and surprisingly lenient with the weaklings; and so he brought out the best that was in each and every member of his classes.

There is a something that is never found in books that comes to the student facing a truly great teacher; something dearer and better than words can express and we who for many days had Professor Roberts for an instructor know what that something is—and we are the richer for it.

* * * *

"A Prophet Among Farmers"

By E. Davenport

Dean and Professor Emeritus, College of Agriculture, University of Illinois

PROFESSOR ROBERTS of Cornell! A king among men, a prophet among farmers, a pioneer among those who seek of science, to inspire the service of agriculture to all the people and to better the conditions of the millions who live by the land. His work is a blessing and his life a benediction.

* * * *

A Layer of Foundations

By L. H. Bailey

Formerly Dean of the New York State College of Agriculture, Cornell University

I AM glad you are to remember I. P. Roberts' anniversary with a special number of the American Agriculturist. He richly deserves such remembrance and recognition. It is also good for the younger workers to be brought into knowledge of one who stood so near the beginnings of modern agricultural education and to be made aware of the accomplishments of those days. Those days may seem to us to be the remote times of small things, but the successes were as big in their time as are the larger accomplishments in our time.

Foundations are laid slowly, and piece by piece. On a good foundation, any extent of superstructure can be built, but on poor and false foundations nothing permanent can be erected. The great developments of the present day are the consequences of painstaking, honest, prophetic work in years long past.

Professor Roberts not only did good work and saw clearly, but he held on. Nothing would make him let go. Again and again he would say that the time must come when agriculture would take its proper place in the institutions of the land and all his life he planned buildings and laboratories that it was never his privilege to see. In his active day, he was a wise personal teacher, an ideal guide to students who studied in the great laboratory of the open fields. He was a philosopher of the farm country. As a teacher, he covered the subject with keen discrimination, wisdom of a resourceful life, and a ready wit. He was also a successful practical farmer. At Cornell, the loyalty to him is touching, even among those who were never his students. His active work was wider than the State in which he was born and to which he gave the fullest of his life.

It is a blessing to all of us that he has accomplished ninety years. We rejoice to think of him as one of us; and we like to tell him how much we remember and appreciate him.

"A Straight Jumper"

By J. L. Stone

Professor Emeritus, New York State College of Agriculture

IN his book, "The Autobiography of a Farm Boy" Professor Roberts states that when he arrived at Cornell University on February 1, 1874, he found awaiting him a few students in agriculture whom he refers to as "a pocket edition of a class." The writer of these lines, then a senior in the

(Continued on page 42)

PUBLIC FORMULA FEEDS

THE COOPERATIVE G. L. F. EXCHANGE is running its feed pool to buy your winter feed requirements for you at the prices which prevail between now and early fall. Feed prices are usually at their lowest point during this period.

Voluntarily placing your orders with your G. L. F. agent means savings in overhead and sales cost. In addition, if you and your neighbors buy in large quantities, you will get the benefit of a large volume purchase and of lower manufacturing costs. All of these factors will reduce the pool price.

The formulas for G. L. F. Rations are public. The rations are manufactured under G. L. F. supervision. They are made for farmers by a farmers' organization. They are not manufactured to get rid of by-products or to make profits. Per hundred pounds of digestible nutrients your G. L. F. Rations are and undoubtedly will continue to be the cheapest on the market.

Thoughtful deliberation will convince you of the wisdom of using the G. L. F. to buy your feed for you. Remember, orders voluntarily placed in the G. L. F. feed pool will make your winter feed bill lower.

Among the Farmers

New York Fruit Prospects Less Favorable

CONTRARY to early reports and indications, the apple crop in Western New York is not going to be as heavy as was first expected. Early in the season Baldwins promised a heavy crop, but indications are now that it will be no more than fair and some growers are of the opinion that the crop is going to be light. The bloom was heavy and apples set well, but since these early reports were received there has been a steady decrease in the prospects. Even at this date it is too early to report on the June drop. If this is right there will be only a fair crop of apples. However, if it is in any proportion to the drop since apples set, indications are that there is going to be a short crop for harvest next fall.

According to a report of the New York State Horticultural Society which has just conducted a survey of the fruit situation among 253 members, the apple crop throughout the State is about the same as it was last year at this time, but only two-thirds as high as it was at this time in 1920. The report states however, that "as conditions last year improved more than they usually do after the first of July, the crop is not expected to be as large as that of last year unless weather conditions from now on are unusually favorable. Compared with conditions a year ago, the reports indicate two-thirds as many fall apples, nearly twice as many Baldwins, three-fourths as many Greenings and slightly more of McIntosh and Northern Spy. There are considerable differences this year in the reports for individual orchards, but prospects for apples are rather more uniform over the State than they have been for several years."

Aside from apples, the fruit prospects are not nearly as good as they were at this time last year. The reports indicate between one-half and two-thirds as many pears, Bartlets being particularly light; a little more than two-thirds as many peaches; a little more than three-fourths as many plums and quinces and seventh-eighths as many cherries and grapes.

NEW YORK COUNTY NOTES

Orange Co.—Haying is now in full blast. The crop is looking fine. Potatoes are not as good as usual, undoubtedly due to the fact that they were injured by the severe drought and heat during the latter part of June. Cherries and currants are making the largest crop in years. They are of excellent quality. Prices vary from 12 to 25c a quart. The right kind of farm people want prohibition and the strict enforcement of the Eighteenth Amendment. We need a sober nation to keep us from being killed by drunken automobile drivers. Eggs have been bringing 26c a dozen on the average at village stores from March 1 to July 4, the lowest price in years.—MRS. W. V. S.

Oswego Co.—Canneries have started putting up peas. The indications are that the crop will be heavier this year than usual, although the yield will be about average. Later varieties look particularly good. The greater part of the acreage is in the townships of Scriba, Oswego and Hannibal. Oswego strawberries started moving to New York City for the first time last week. The berry acreage in Oswego this year is the largest in several years. Due to the late season the shipments have started much later than usual.

In Western New York

Steuben Co.—Around Avoca there has been little or no rain since June 14, and the weather has been extremely hot and dry, consequently if rain does not come soon, farmers are going to suffer heavy losses. Contrary to the general practice, potato plantings were heavier in June than in May. With the hot and dry weather some anticipation is felt for the potato crop. Pastures are drying up and indications are that the hay crop will be less than half last year's. Help is extremely scarce. Work on the State Roads has attracted men from the farms in many cases.

Seymour Bridge, president of the

Steuben County Farm Bureau and chairman of the picnic committee, announced the date of the annual picnic as August 11. The Soldier's Home will be the meeting place the same as of last year. One of the special features will be the country-wide quoit-pitching tournament of which D. D. Cottrell of North Cohocton is in charge. Mr. Cottrell himself is an expert at the game and offers professional services in the coaching of community teams previous to the contest. The usual sports such as a ball game, races and stunt contests will be included in the program. The committee promises a bigger and better picnic than ever before.

Monroe Co.—Farmers have been setting out cabbage lately. It looks as though the cabbage will be much less than planned on account of the cabbage maggot and unfavorable weather conditions. Apples have not set in anywhere the proportion they blossomed. Greenings will undoubtedly be very light. Baldwins will make a fair showing, potatoes are coming up and looking fairly good. Late potatoes are just beginning to show up nicely. More beans are being raised in this section this year than in the last few years. This year beans were one of our main crops in this section, but on account of prices, farmers have not put in so many of late. During the last week in June one of the most violent rain, wind and hail storms in recent years swept over this part of Monroe County creating heavy damage. The storm was more like a cyclone, causing particularly heavy losses to fruit growers. Hundreds of trees were up-rooted. Grain fields leveled and severe damage was done to potatoes, beans and cabbage by hail. The wind was so severe that many buildings were blown off the foundations. In many instances the farmers will have to replant their crops.

Chautauque Co.—Farmers have been busy sowing buckwheat and cultivating corn. Many have started haying. The acreage of buckwheat will not be as large as some years owing to the dry, hard condition of the ground. We have had two or three good rains, but we need more. What help farmers are fortunate enough to hire, ask 50c an hour and board during haying time. As everyone seems to have gone to the city to work many farmers have decided to do most of their haying alone.—P. S. S.

Ontario Co.—We are having a fine growing season, all crops look well. We have had almost too much rain to make hay, with the result that some of the hay brought into the barns is badly colored. Help is out of the question. Farmers are trading help and are getting along the best they can.—H. D. S.

NEW YORK HAY AND CABBAGE PROSPECTS

H. H. LYON

I have seen a good crop of hay harvested when the prospect for a crop on June 10 was very poor. On a trip close to a 100 miles on June 10, I did not find promises for a hay crop at all flattering. Just now I was reading an article, "A Plea for Courage." It related to railroads but its plea did not appeal to me as does the farmers' courage in such times as we have now. It is true that for two days or so rains have fallen, but considerably more will be needed if we are to get the amount of moisture necessary to give us an average hay crop.

There is a much better feeling than was the case a week ago. Certainly there is a possibility for fodder to keep the cows next winter, yet the prospect is none too bright. The dry weather for two weeks or so made corn planting for this season almost a thing of the past and some of the farmers even went beyond their calculations, plowing up discouraging looking meadows and drilling in corn. This corn for fodder is really good stuff. It makes better feed for cattle, even this late planting, (Continued on page 42)

June Milk Pool Price \$2.00

Farm News From New Jersey and Pennsylvania

THE Dairymen's League Cooperative Association announces that the gross pool price for the month of June is \$2.00, which is 10 cents more than the gross pool price for May. From the gross pool price, the Association has deducted 10 cents, which is borrowed on Certificates of Indebtedness, and 8½ cents, which is to defray expenses of administration, advertising, etc. This leaves a net cash price to farmers of \$1.81½.

It is most significant that the June price is above the May price. Ordinarily June prices are lower, due to the heavy surplus resulting from flush of production.

Better prices for by-products, such as skim milk, taking care of the surplus, increased business due to advertising, are all tending to increase the efficiency of the organization.

NEW JERSEY COUNTY NOTES

Salem Co.—We have had a great deal of dry, hot weather. The drought has cut short the hay crop. If we are lucky, we may cut a second cutting that will help fill the mows, so that we may have a little to sell, which we usually do, profitably. The drouth cut short the pea crop, but growers will come out fairly well as prices are unusually good. The strawberry crop was cut something terrible. Some who expected reasonably good results did not pick a quart of berries. Those who were lucky enough to have berries had a terrible time getting pickers. We always used to get for pickers Italian families from the city, but this season they were not to be had at any price. The industries in the cities are so active that all the available help is used to better advantage, therefore they were scarcer and more independent than ever. Those we did get we had to pay their transportation both ways as well as a big bonus for the agent who procured them. After paying for picking and transportation, which by the way is just about double what it was a few years ago, we just about break even. Some farmers were not as fortunate. We have been having difficulty in setting out tomatoes, cabbage, peppers and sweets as the ground is terribly dry. Corn is looking fair, while early potatoes are quite the contrary. Grapes and fruit trees look fairly good. The crop however, will not be abundant. Rhubarb and asparagus paid very well. The latter cut quite late and brought good prices. The bottom has fallen out of the egg market and hens do not seem to be laying well either. Farmers throughout this section planned to plant about as many late potatoes as usual, although general conditions are not known. Still the farmer keeps on planting and sowing and more than likely will probably have difficulty in getting prices to dig up the potatoes.—S. B.

Hunterdon Co.—Wheat harvest was in full swing during the first week in July. The drought still continues and has been very hard on the farmers. The hay crop is very scant, not being over twenty per cent of a crop. The oats crop will be short. Some farmers are cutting it to feed to cows. Corn is looking good. Early potatoes will be a failure. Prices are holding up very well. Cherries find ready sale at \$2 a basket. Potatoes are selling at \$2.50 a bushel at retail. Eggs 25c a dozen, butter 60c, corn \$1 a bushel, wheat \$1.25, oats 50c, hay \$20. However there is no hay in this part of the State for sale. The market for cows is very dull. Farmers are exchanging help as there is no help to get on the farm. Many farms are lying idle.—J. R. F.

CENTRAL PENNSYLVANIA NOTES

Making hay is in full swing and the weather has been favorable for the job. The crop is short, but hay is fine in quality. Pastures are short. Corn is being cultivated for the last time. It has grown well during the dry weather. Potatoes are suffering on account of drought. Wheat is coloring rapidly and will be ready to harvest by the last of this month. Oats are very

short in the stalk and need rain to make a good crop.

Cherries are a good crop. Peaches and plums will be fair, but apples will make only a half crop. Strawberries were a short crop due to dry weather.

Owing to scarcity of help, many tenants on large farms are either buying small farms or are going to quit in spring. Maine Turner bought Peter Stohl's farm of 40 acres in Buffalo township for \$3,500. Harry Klinger bought Seth Zimmerman's 40-acre farm near Mifflinburg for \$10,000. Emma C. Beifer sold her farm of 167 acres in Buffalo township to James H. Straub for \$14,500. George Boyer, the tenant, will have sale in the spring and move to Vicksburg. The White Deer Water Company bought Jacob Bowersox's 62-acre farm for \$3,000. At a recent public sale, Henry Frock's farm of 40 acres near Vicksburg was bid to \$8,500, but not sold, as he wants \$8,800 for it including part of the corn crop for the silo.—J. N. GLOVER.

Tioga Co.—The dry spell of late June was broken by nice showers that did a world of good. The farmers are well along with haying, which will be a short crop on account of the dry weather. Oats look fairly good. Corn is rather late, but is growing nicely now. Pastures look like August on account of the dry weather. The apple and pear crop will be rather short this year. Strawberries brought 25c a quart.—Mrs. W. C. G.

LONG NEWS IN SHORT PARAGRAPHS

The Carded Wool Manufacturers' Association of Boston, Mass., is sending a statement to the wool growers of the country attempting to prove that a law which would compel manufacturers who label the amount of wool in garments would result in injury to all concerned. They say that such a law would be impossible to enforce and that any increased demand for wool resulting therefrom would benefit only the importers of wool and not the domestic producers.

It is possible that the manufacturers are right and that the law would be difficult to enforce, but their point seems to be very poorly taken, that increased demand would not affect the price of domestic producers. Increased demand always helps prices.

Sheep in the United States have for several years produced about 110,000,000 pounds of wool (scoured weight). This is about one-third of the amount of wool consumed for clothing by the American people. Domestic requirements are increasing with the growth of population while the number of sheep remains about stationary. This would indicate that the farmer who likes and understands sheep, and has a farm adapted to them, can be fairly certain of making a success with sheep during the next decade.

* * *

Wheat went down to a dollar in the Chicago market on July 9. On this day also the first carload of new wheat arrived. Before the war, dollar wheat would have seemed a wonderful price to the growers. To-day it is far below the cost of production and the world's surplus bids fair to keep it there. It would seem that diversified farming is the only answer to the American wheat farmers' problem.

* * *

For some time there has been a great migration of colored farm hands from the farms of the South to the cities in the North. This has gone so far that in some sections where the negroes once greatly predominated in number, there are now more whites than negroes left. In Georgia alone, during the past year, 32,000 colored farm hands migrated.

* * *

The seventeen-year locust has appeared in several sections this summer. The appearance of this insect always causes interest and comment chiefly because the same brood comes back only once in seventeen years. However, because there are several different broods, we see them fairly frequently.

"The Wisest Farmer I Ever Knew"

(Continued from page 39)

course in agriculture was a member of that class. So far as he knows he is the only survivor of the class. That class was in operation from early in February to near the end of June—somewhat less than five months. Brief as was our relationship as teacher and pupil I still look upon that experience as the most vital event of my college course and one of the most important in my life.

My memory does not retain very much regarding the details of the instruction received from Professor Roberts during those last five months of my college course, nor am I able to satisfactorily explain the benefits that I feel sure I received from his instruction. I was a real farm boy, instructed somewhat in sciences having a bearing on agriculture; he was a real "dirt farmer," but he was much more than that. He was a philosopher whose mind grasped the agricultural significance of the teachings of science the most readily and rapidly of any man I ever knew. In a small class there is opportunity for close personal contacts—many questions and answers. One of the first and strongest impressions that Professor Roberts made upon me in those early days was, that he "jumped at his conclusions." He did not seem to pause to consider the questions put to him. I soon came to realize, however, that though he might jump at conclusions he was a remarkably straight jumper. He could size up a new proposition and fix on the significant features of it almost instantly. Considering that he had not been favored with extended school opportunities, he had a wonderful fund of practical knowledge and a store of scientific facts which must have been acquired from his general readings. His native common sense enabled him to use this knowledge most efficiently.

Much of the information I had acquired during my college course was held as a lot of unrelated facts, and their bearing on practical agriculture was not clearly discerned. While I did not understand it at the time, it now seems to me that Professor Roberts' way of looking at things seems to have enabled me to connect up the facts and discover their practical bearings as I had not been able to do. It was not the new information acquired during those four or five months that made my contact with Professor Roberts so vital to me as much as the insight that he gave me as to how to use the information I had already acquired. I believe it is this quality of Professor Roberts' teaching that accounts for much of his unusual success as an instructor of students.

It is generally stated that the Short Course in Agriculture at Cornell be-

gan in 1893-94, but I am of the opinion it began in February, 1874, with the work of Professor Roberts.

During the twenty-three years that I was farming in Pennsylvania he visited me at the farm four or five times and I found those visits exceedingly helpful. It was at his invitation that I came to Cornell in 1897 to take part in the extension work that was then being inaugurated on a more extended scale. For six years, 1897-1903, I was closely associated with him in the extension work, of which he was director. My duties as an extension worker brought me into close touch with many farmers throughout the State. In his autobiography Professor Roberts speaks of the attitude of the farmers of the State towards the college and experiment station and towards himself. It ranged all the way from mildly favorable to indifference and active hostility. When I began my work among New York farmers, I found that most of the hostility to the agricultural work of Cornell had disappeared and many were enthusiastically favorable. I found more opportunities to defend the experiment station at Geneva against criticism than I did Cornell. I am sure that Professor Roberts' touch with the farmers during previous years had been most effective in removing misunderstanding between farmers and the agricultural institutions and without doubt he did more to "bridge the chasm" between the farmers and the scientific men than any other person.

The significance and appraisal of his work at Cornell for the agriculture of the State and the nation I will leave for other and abler hands, but during all the years I have been permitted to associate with him I have found him a helpful advisor, a sympathizing friend in sorrow and an understanding and appreciative administrator.

New York Hay and Cabbage Prospects

(Continued from page 40)

than we can get out of timothy hay that gets nearly ripe before it is cut. Our farmers are dreadfully short of help, but they are wonderfully resourceful and I'll risk them in this or any emergency rather than the financier I was just reading about who would scrap the Interstate Commerce Commission.

Cabbage Acreage Will be Lower

At a local vegetable growers' meeting just held one thing was apparent. These men are going to grow less cabbage this year than has been the custom. The State report indicates a reduction in the crop of five per cent from last year. In this group the indicated reduction was very much more. I am not sure how it may be throughout the State when the acreage is finally determined, but I look for a much smaller acreage than the early reports indicated. The reason for the reduction is largely lack of help, but the reported large acreage and the low prices of last year are important factors. These men even indicate that they will not in the future grow cabbage as they once did. One can readily discount this statement, but it indicates the present feeling.

Cabbage has been nearly our only cash crop for a while, although potatoes are grown to some extent. Potatoes have not been raised as much for a few years and the plantings will be light this year. Low prices are likely to destroy almost any industry if continued, especially when labor is hard to get. Even the dairy cows are somewhat fewer in number, but cows are being kept more nearly up to the average. Cows seem to be somewhat in demand. A given amount of work on the dairy herd seems to return better results than almost anything else. We all know that milk is much too low, but dairymen are pinching along and getting something out of it in one way or another. The dairy is the standby I am not looking for cabbage to be discarded, but here there will be less of it until prices or labor, or both are better adjusted. It rather looks to me that if the work can be done, one may as well grow as many this year as can be fed to the cows. There may be a chance to sell some.

SITUATIONS WANTED

WANTED—Place to work on small farm by the month. W. B. GROVER, Conewango Valley, N. Y.

MISCELLANEOUS

ESTEEMED PATRON—It will pay you to send 50 cents and get the household necessity, a waterproof folding shopping bag, size 12 by 18 inches. Money refunded if not proven satisfactory. Agents wanted. Address, O. F. ECKELS, P. O. Box 323, New Haven, Conn.

ALL-WOOL HAND AND MACHINE Knitting Yarns for sale. We are also doing custom-work at the same old prices. Write for samples and particulars. H. A. BARTLETT, Harmony, Maine.

KODAK FINISHING—Trial offer. Any size film developed for 5 cents. Prints, 3 cents each. Over-night service. Expert work. YOUNG PHOTO SERVICE, 40 R Bertha St., Albany, N. Y.

EAT APPLE PIE ALL SUMMER—Wayne County Evaporated Apples. Best in the world. Stock for 12 pies, \$1.00 postpaid. Good till used. ALVAH H. PULVER, Sodus, N. Y.

LATEST STYLE SANITARY MILK TICKETS save money and time. Free delivery. Send for samples. TRAVERS BROTHERS, Dept. A, Gardner, Mass.

TWENTY TONS HARDWOOD ASHES delivered your railway station, \$400. GEORGE STEVENS, Peterborough, Ontario.

EXTENSION LADDERS—27c foot; three-leg fruit ladders, 30c foot. Freight paid. A. L. FERRIS, Interlaken, N. Y.

FERRETS—Prices free. Book on Ferrets, 10 cents. Muzzles, 25 cents. BERT EWELL, Wellington, Ohio.

The Brown Mouse — By Herbert Quick

"WELL," said Jennie, "do you desire to rest your case right here?"

Mr. Bonner made no reply to this, and Jennie turned to Jim.

"Now, Mr. Irwin," said she, "while you have been following out these very interesting and original methods, what have you done in the way of teaching the things called for by the course of study?"

"What is the course of study?" queried Jim. "Is it anything more than an outline of the mental march the pupils are ordered to make? Take reading: why does it give the children any greater mastery of the printed page to read about Casabianca on the burning deck, than about the cause of the firing of corn by hot weather? And how can they be given better command of language than by writing about things they have found out in relation to some of the sciences which are laid under contribution by farming? Everything they do runs into numbers, and we do more arithmetic than the course requires. There isn't any branch of study—not even poetry and art and music—that isn't touched by life. If there is, we haven't time for it in the common schools. We work out from life to everything in the course of study."

"Do you mean to assert," queried Jennie, "that while you have been doing all this extra work you haven't neglected anything?"

"I mean," said Jim, "that I'm willing to stand or fall on an examination of these children in the very text-books we are accused of neglecting."

Jennie looked steadily at Jim for a full minute, and at the clock. It was nearly time for adjournment.

"How many pupils of the Woodruff school are here?" she asked.

A mass of the audience, in the midst of which sat Jennie's father, rose.

"Why," said Jennie, "I should say we had a quorum, anyhow! How many will come back to-morrow morning at nine o'clock, and bring your school-books? Please lift hands."

Nearly every hand went up.

"And, Mr. Irwin," she went on, "will you have the school records, so we may be able to ascertain the proper standing of these pupils?"

"I will," said Jim.

"Then," said Jennie, "we'll adjourn until nine o'clock. We'll have school here to-morrow. And, Mr. Irwin, please remember that you state that you'll stand or fall on the mastery by these pupils of the text-books they are supposed to have neglected."

"Not the mastery of the text," said Jim. "But their ability to do the work the text is supposed to fit them for."

"Well," said Jennie, "I don't know but that's fair."

"But," said Mrs. Haakon Peterson, "we don't want our children brought up to be yust farmers. Suppose we move to town—where does the culture come in?"

* * * * *

The Chicago papers had a news item which covered the result of the examinations; but the great sensation of the Woodruff District lay in the Sunday feature carried by one of them.

It had a picture of Jim Irwin, and one of Jennie Woodruff—the latter authentic, and the former gleaned from the morgue, and apparently the portrait of a lumber-jack. There was also a very free treatment by the cartoonist of Mr. Simms carrying a rifle with the intention of shooting up the school board in case the decision went against the schoolmaster.

"When it became known," said the news story, "that the schoolmaster had bet his job on the proficiency of his school in studies alleged to have been studiously neglected, the excitement rose to fever heat. Local sports bet freely on the result, the odds being eight to five on General Proficiency against the field. The field was Jim Irwin and his school. And the way those rural kids rose in their might and ate up the text-books was simply scandalous. There was a good deal of nervousness on the part of some of the small starters, and some bursts of tears at excusable failures. But when the fight was over, and the dead and wounded cared for, the school board and the county superintendent were forced to admit that they wished the average school could do as well under a similar test."

"The local Mr. Dooley is Cornelius Bonner, a member of the 'board.' When asked for a statement of his views after the county superintendent had decided that her old sweetheart was to be allowed the priceless boon of earning forty dollars a month during the remainder of his contract, Mr. Bonner said, 'Aside from being licked, we're all right. But we'll get this guy yet, don't fergit that!'"

"The examinations tind to show," said Mr. Bonner, when asked for his opinion on the result, "that in or-r-rder to larn anything you shud shtudy somethin' ilse. But we'll git this guy yit!"

"Jim," said Colonel Woodruff, as they rode home together, "the next heat is the election. We've got to control that board next year—and we've got to do it by electing one out of three."

"Is that a possibility?" asked Jim. "Aren't we sure to be defeated at last? Shouldn't I quit at the end of my contract? Is it worth the fight?"

"It's not only possible," replied the colonel, "but probable. As for being worth while—why, this thing is too big to drop. I'm just beginning to understand what you're driving at. And I like being a wild-eyed reformer more and more."

CHAPTER XIV

THE COLONEL TAKES THE FIELD

EVERY Iowa County has its Farmers' Institute. The Woodruff District was interested in the Institute because of the fact that a rural-school exhibit was one of its features that year, and that Colonel Woodruff had secured an urgent invitation to the school to take part in it.

"We've got something new out in our district school," said he to the president of the institute.

"So I hear," said the president— "mostly a fight, isn't it?"

"Something more," said the colonel. "If you'll persuade our school to make an exhibit of real rural work in a real rural school, I'll promise you something worth seeing and discussing."

Such exhibits are now so common that it is not worth while to describe it; but then, the sight of a class of children testing and weighing milk, examining grains for viability and fowl seeds, planning crop rotations, judging grains and live stock was so new in that county as to be the real sensation of the institute.

Two persons were a good deal embarrassed by the success of the exhibit. One was the county superintendent, who was constantly in receipt of undeserved compliments upon her wisdom in fostering "really practical work in the schools." The other was Jim Irwin,

who was becoming famous, and who felt he had done nothing to deserve fame. Professor Withers, an extension lecturer from Ames, took Jim to dinner at the best hotel in the town, for the purpose of talking over with him the needs of the rural schools. Jim was in agony. The colored waiter fussed about trying to keep Jim in the beaten track of hotel manners, and juggled back into place the silverware misappropriated to alien and unusual uses. But, when the meal had progressed to the stage of conversation, the waiter noticed that gradually the uncouth farmer became master of the situation, and the well-groomed college professor the interested listener.

"You've got to come down to our farmers' week next year, and tell us about these things," said he to Jim. "Can't you?"

Jim's brain reeled. He got to a gathering of real educators and tell his crude notions! How could he get the money for his expenses? But he had that gameness which goes with supreme confidence in the thing dealt with.

"I'll come," said he.

"Thank you," said the Ames man. "There's a small honorarium attached, you know."

JIM was staggered. What was an honorarium? He tried to remember what an honorarium is, and could get no further than the thought that it is in some way connected with the Latin root of "honor." Was he obliged to pay an honorarium for the chance to speak before the college gathering? Well, he'd save money and pay it.

"I—I'll try to take care of the honorarium," said he. "I'll come."

The professor laughed. It was the first joke the gangling innovator had perpetrated.

"It won't bother you to take care of it," said he, "but if you're not too extravagant it will pay you your expenses and give you a few dollars over."

Jim breathed more freely.

"All right," he exclaimed. "I'll be glad to come!"

"Let's consider that settled," said the professor. "And now I must be going back to the opera-house. My talk on soil sickness comes next. I tell you, the winter wheat crop has been—"

But Jim was not able to think much of the winter wheat problem as they went back to the auditorium. He was worth putting on the program at a State meeting! He was actually worth paying for his thoughts.

Calista Simms thought she saw something shining and saint-like about the homely face of her teacher as he came to her post in the room in which the school exhibit was held. Calista was in charge of the little children whose work was to be demonstrated that day, and was in a state of exaltation to which her starved being had hitherto been a stranger. She yearned over the

children in her care, and would have been glad to die for them—and besides was not Newton Bronson in charge of the corn exhibit, and a member of the corn-judging team? To the eyes of the town girls who passed about among the exhibits, she was poorly dressed; but if they could have seen the clothes she had worn on that evening when Jim Irwin first called at their cabin and failed to give a whoop from the big road, they could perhaps have understood the sense of wellbeing and happiness in Calista's soul at the feeling of her whole clean underclothes, her neat, if cheap, dress, and the "boughten" cloak she wore—and any of them, even without knowledge of this, might have understood Calista's joy at the knowledge that Newton Bronson's eyes were on her from his station by the big pillar, no matter how many town girls filed by.

"Hello, Calista!" said Jim. "How are you enjoying it?"

"Oh!" said Calista, and drew a long, long breath. "Ah'm enjoying mysef right much, Mr. Jim."

"Any of the home folks coming in to see?"

"Yes, seh," answered Calista. "All the school board have stopped by this morning."

Jim looked about him. He wished he could see and shake hands with his enemies, Bronson, Peterson and Bonner: and if he could tell them of his success with Professor Withers of the State Agricultural College, perhaps they would feel differently toward him. There they were now, over in a corner, with their heads together. He went

WHAT HAS HAPPENED

JIM IRWIN is on trial! He has endeavored to introduce new methods into the District School and the school board has impeached him for incompetency.

Worse yet, his old sweetheart Jennie Woodruff, now County Superintendent, is presiding at the trial. Col. Woodruff, her father, is in the audience, but no one suspects him of having administered encouragement to the perplexed young teacher, nor of rounding up the eager youngsters who come to court to be examined in the studies Jim is accused of neglecting.

The case against Jim has been presented.

toward them, his face still beaming with that radiance which had shone so plainly to the eyes of Calista Simms, but they saw in it only a grin of exultation over his defeat of them at the hearing before Jennie Woodruff. When Jim had drawn so close as almost to call for the extended hand, he felt the repulsion of their attitudes and sheered off on some pretended errand to a dark corner across the room.

They resumed their talk.

"I'm a Dimocrat," said Con Bonner, "and you fellers is Republicans, but when it comes to electing my successor, I think we shouldn't divide on party lines."

"The fight about the teacher," said Haakon Peterson, "is a ting of the past. All our candidates got odder jobs now."

"Yes," said Ezra Bronson. "Prue Foster wouldn't take our school now if she could get it."

"And as I was sayin'," went on Bonner, "I want to get this guy, Jim Irwin. An' bein' the cause of his gittin' the school, I'd like to be on the board to kick him off; but if you fellers would like to have some one else, I won't run, and if the right feller is named, I'll line up what friends I got for him."

"You got no friend can git as many votes as you can," said Peterson. "I tank you better run."

"What say, Ez?" asked Bonner.

"Suits me all right," said Bronson.

"All right," returned Bonner, "I'll take the office again. Let's not start too soon, but say we begin about a week from Sunday to line up our
(Continued on page 45)

"I mean to get this guy, Jim Irwin"

Eat What You Can, and What You Can't—Can

The Important Steps of This Important Summer Occupation, with Tables for Different Foods

MORE cans adorn the shelves of careful housekeepers each summer than did the last. We are learning that practically every edible fruit, vegetable and meat may not only be put up but, if properly handled, will keep its flavor and food value unspoiled by the process.

One vessel for unpeeled fruit (or vegetables before stringing, etc.)
One vessel in which to drop fruit after peeling or for washing vegetables and later for cold water.
One pitcher from which the syrup or brine may easily be poured into jars.

ing, W. Va., and other commercial firms, have all issued valuable booklets on home canning, most of which are sent free on request.

1 teaspoon baking powder in flour, ½ cup nuts. Drop by teaspoon. Bake and ice with confectioners' sugar.

Peanut Butter Cookies

One-half cup peanut butter blended with ½ cup (scant) melted shortening, ¼ cup sour milk, 1 cup sugar, 1 scant teaspoon soda, 3 cups flour. Roll thin and bake in rather hot oven.

Ginger Snaps

One coffee cup New Orleans molasses, 1 cup butter, 1 cup sugar. Bring to a boil. Then immediately add 1 teaspoon soda and 1 tablespoon ginger. Flour to roll thin. Bake quickly.

Prime Sugar Cookies

Four fresh eggs thoroughly beaten, 2 cups sugar, 1 cup butter. Cream the three ingredients until very light and smooth. Flavor to taste. Use flour in proportion of 2 heaping teaspoons of baking powder to 4 cups of flour many times sifted. About 6 cups will be needed. These cookies will not stick.

Molasses Drops

One cup molasses, ½ cup shortening, ½ cup sugar, 2 eggs, ½ cup boiling water, 2 teaspoons soda, salt, 1 teaspoon ginger and cinnamon, 3½ large cups of flour.

Filled Cookies

One cup sugar, ½ cup melted butter, 1 well beaten egg, pinch of salt, ½ cup milk, 2 teaspoons cream of tartar, 1 teaspoon soda, 2½ cups flour. Roll thin and on one cookie put spoon of filling and another cookie on top, pressing down edges. Bake to a golden brown. For filling use 1 cup sugar, ½ cup cold water and 1 heaping teaspoon of flour cooked until thick and cooled.

WHEN YOU COOK COOKIES

COOKIES hold their place in the hearts of small boys, whatever other styles may change. Indeed, growing up rarely makes one forget this typically American delicacy, and the good housewife is always on the lookout for new variations of the cookie recipe. Mrs. Franklin Flower of Troy, N. Y., contributes two oatmeal cookie recipes, while Mrs. George Gray of East Springfield, N. Y., sends us the other recipes which give a wide variety of flavors.

Plain Oatmeal Cookies

Cream together 2 eggs, 1 tablespoon butter, and 1½ cups sugar. Add 1 cup milk, stir in 2 cups flour and 3 teaspoons baking powder. Add 1 cup raisins, 1 teaspoon cinnamon, a little nutmeg and vanilla if desired. Stir, then add 2 cups rolled oats. Drop with teaspoon and bake.

Molasses Oatmeal Cookies

One egg, 1 tablespoon shortening, ½ cup brown sugar, 1 cup molasses, 1 teaspoon each of salt, cinnamon, cloves and ginger; 1 cup of raisins. Add 2 teaspoons soda stirred into ¾ cup boiling water. Add 2½ cups flour and about 1½ cups rolled oats or enough to drop nicely.

Chocolate Cookies

One cup brown sugar, ½ cup (scant) melted butter, 1 beaten egg, ½ cup of sweet milk in which is dissolved ¼ teaspoon soda, 1½ cups flour, ½ cup cocoa,

It has been estimated that 1,250 jars or 1,050 quarts of food will give a year's supply for a family of five. Not all of us need depend so largely on canned foods, yet the woman who this year increases her store of preserved sweets, greens, relishes, semicoarse vegetables and meats will be able to give her family the varied meals which supply the many different food elements needed for health, and will also save herself trouble and money during the months when fresh supplies are not so plentiful.

The science of home canning has been made very exact indeed and with the proper equipment and scrupulous attention to details, any woman can put her year's supply in her home kitchen. The following list of steps and tables give the essentials of the work in brief:

1. Carefully wash all jars, covers, rubbers, canner and other equipment.
2. Place jars and covers in canner, cover them with cold or tepid water.
3. Place canner over fire and sterilize jars at least ten minutes, after the water has reached boiling point.
4. Place a second vessel of water over the fire, to be heated for blanching of vegetables.
5. Sort, grade and wash products to be canned, being careful to discard any that are over-ripe or decayed.
6. Prepare in pieces of a desirable and convenient size for canning.
7. Blanch in boiling water according to tables.

Cold dip vegetables, but not fruits. Green vegetables should be blanched in live steam.

8. Pack into sterilized jars.
9. Add syrup to fruits, and salt and water to vegetables.
10. Dip rubber ring into hot soda water, using one teaspoon soda to one cup boiling water, then place it on the jar.

11. Place cover in position and partially close—if screw top, screw cover half way on; if glass top, bring wire bail into position across top with a distinct click, but do not press clamp down at side until the fruit or vegetable has been processed.

12. Process in canner according to time given in tables.

13. Remove jars from canner and press down clamp as each jar is taken out.

14. Invert jar to cool, and test joint for perfect seal.

15. Store in cool place away from strong sunlight.

A suggested equipment for efficient canning of fruit would be:

- One vessel with false bottom to be used for canner.
- One vessel for blanching.

One small vessel for soda water when cleansing rubber.

- One sharp paring knife.
- One tablespoon for use in packing.
- One cloth or wire basket, for blanching.

Cloths, or lifters, for handling jars. In preparing sugar syrup for fruits, follow this table:

Light syrup, 2 cups sugar to one gallon water; medium syrup, 6 cups sugar to one gallon water; heavy syrup, 12 cups sugar to one gallon water.

Syrup should be boiled for 10 to 20 minutes and strained through a cloth to remove impurities.

To prepare brine for vegetables, dissolve 5 tablespoons of salt in one gallon of warm water. If brine has any impurities or sediment it should be strained. Dry salt is often added at the top of the jar, and then water is poured over till the jar is completely filled, using a level teaspoon of salt to the quart. This is perhaps the easier method, but does not distribute the salt quite so evenly.

A pressure cooker comes to be almost an essential to the woman who does much home canning. Directions come with every commercial cooker, but in the main, follow the same principles. A pressure cooker is especially useful, for meats and some vegetables; it saves a great deal of time in processing and the outfits are now very compact and comparatively inexpensive.

Never economize on rubbers, jars or other accessories. Every jar should be tested before using as should the rubbers.

Test Every Jar

A Mason jar may be tested by placing the lid on it without a rubber and attempting to insert the thumb nail between the lid and the jar. If this can be done the jar is defective. Another test is to adjust the rubber and the lid and to pull out the rubber in one place. If the rubber stays out, the jar is good; if it springs back the jar is defective.

The testing of any type of jar may be accomplished by partly filling the jar with boiling water, adjusting the cover and the rubber and sealing, and inverting the jar. If it leaks, it should be examined to determine whether the leakage is due to an imperfect jar, a poor rubber, or to improper adjustment of the wire clamp, in case a wire clamp is used. If any defect noticed cannot be remedied the jar should be reserved for pickles or some food that does not require sealing.

The Department of Agriculture, the Home Economics school at Ithaca, the Hazel-Atlas Glass Company of Wheel-

Patterns for Home Sewing

And Interesting Figures From the Patent Office

WOMEN have invented everything from an egg beater to a rotary plowshare, says the U. S. Department of Labor, and the idea that the feminine sex is disqualified for mechanical ingenuity is entirely disproved by the patent records.

Nearly 1,400 different items are included on the list of workable inventions thus listed. The greater number are household appliances, and include a washing machine, a carpet beater, a mattress turner, and a mousetrap. A cow-tail holder is one which many women have considered inventing and so is a cover for pie pans which prevents overflow. But others are in the fields office equipment, road building, railway operation, musical instruments, toys and machinery.

Wasn't it the ex-Kaiser who definitely settled woman's interest to include only "children, kitchen and church?" Too bad William can't read the United States patent office records.

The Brown Mouse

(Continued from page 43)

friends, to go to the school election and vote kind of unanimous-like?"

"Suits me," said Bronson.

"Very well," said Peterson.

"I don't like the way Colonel Woodruff acts," said Bonner. "He rounded

career he's had would mix up in school district politics."

"Well," said Bonner, "he seems to take a lot of interest in this exhibition here. That decision of Jennie's might have been because she's stuck on Jim Irwin, or because she takes a lot of notice of what her father says."

"Or she might have thought the decision was right," said Bronson. "Some people do, you know."

"Right!" scoffed Bonner. "In a pig's wrist! I tell you that decision was crooked."

"Vell," said Haakon Peterson, "talk of crookedness wit' Yennie Woodruff don't get very fur wit' me."

"Oh, I don't mean anything bad, Haakon," replied Bonner, "but it wasn't an all-right decision. I think she's stuck on the guy."

The caucus broke up after making sure that the three members of the school board would be as one man in maintaining a hostile front to Jim Irwin. It looked rather like a foregone conclusion, in a little district wherein there were scarcely twenty-five votes. Who wanted to be school director? It was a post of no profit, little honor and much vexation. In the Woodruff District, the incumbents saw no candidate in view who could be expected to stand up against Con Bonner. Jim's hold upon his work seemed fairly secure for the term of his contract, since Jennie had decided that he was competent. He

CLOTHES DESIGNS FOR TWO GENERATIONS

THE diagram tells the story! Front of skirt, waist, sleeves, back. Could anything be simpler? No. 1790 is as cool and debonair a little dress as you could wish and yet a twelve-year-old could make it.

No. 1790 comes in sizes 16 years, 36, 38, 40 and 42 inches bust measure. For size 36 you will need 2 3/4 yards of 36-inch material with 2 1/4 yards of binding. Price 12c, stamps.

A CUTE bloomer dress which any little girl would be proud to wear (and in which she would look so pretty that her mother would be proud too), is No. 1678. The bloomers are separate, so the dress may be made with or without them.

No. 1678 comes in sizes 2, 4, 6, 8 and 10 years. Size 8 requires 3 1/2 yards of 36-inch material with 2 yards of binding. Price 12c, stamps.

A PEARL-BUTTONED linen suit with a frilled waist and straight trousers makes any little boy look "dressed up," yet No. 1123 is very easy for the young mother to make. The sleeves are cut in one with the waist and the ruffles may be omitted.

No. 1123 comes in sizes 2, 4, and 6 years. Size 4 requires 2 3/4 yards 32-inch material with 2 1/4 yards of ruffling. Price 12c.

A NOTHER diagram dress is No. 1682 and one with a stylish draped effect which looks very dressy. It's pretty for the porch on summer evenings and not hard to iron, if it gets wrinkled, the next day.

No. 1682 comes in three sizes, small for 14 and 16 years, medium for 36 and 38 inches bust measure, and large for 40 and 42. Size 36 requires 3 3/4 yards of 36-inch material with 5 1/2 yards of binding. Price 12c, stamps.

To Order: Write name, address, pattern numbers and sizes clearly; enclose 12c in stamps for each pattern, and send your order to Fashion Department. The Summer catalogue, a guide book to the fashions, is only 10c extra, and we suggest that you order your copy to-day.

up that gang of kids that shot us all to pieces at that hearing, didn't he?"

"I tank not," replied Peterson. "I tank he was just interested in how Yennie managed it."

"Looked mighty like he was managin' the demonstration," said Bonner. "What d'ye think, Ez?"

"Too small a matter for the colonel to monkey with," said Bronson. "I reckon he was just interested in Jennie's dilemmer. It ain't reasonable that Colonel Woodruff after the p'litical

could not expect to be retained by the men who had so bitterly attacked him. Perhaps the publicity of his Ames address would get him another place with a sufficient stipend so that he could support his mother without the aid of the little garden, the cows and the fowls—and perhaps he would ask Colonel Woodruff to take him back as a farm-hand. These thoughts thronged his mind as he stood apart and alone after his rebuff by the members of the school board.

Reviewing the Latest Eastern Markets and Prices

CROP ESTIMATES REVISED

HERSCHEL H. JONES

THE revised estimates of 1922 crop peaches, apples, pears and potatoes are just at hand from the United States Department of Agriculture. The commercial production of peaches and pears is reported lower than last year, and of apples, higher by about 3,000,000 barrels. Potatoes are estimated far below the final revised estimates for last year's crop.

The year's peach crop is figured at 48,358,000 bushels for the entire country, compared with a total 1922 crop of 56,705,000 bushels. The production in New York State is estimated at 2,271,000 bushels, compared with 3,400,000 bushels last year; in New Jersey, 2,456,000 bushels, compared with 2,000,000 last year, and in Pennsylvania 1,783,000, compared with 1,560,000 last year.

In view of the lighter production in New York State and less prospect of car shortage, the situation looks more hopeful for Western New York peach growers than last year.

The increase in apple production over last year is chiefly in Western States, but the Federal estimates indicate larger crops also in Pennsylvania, Virginia, West Virginia, Michigan, Maine, Massachusetts, New Hampshire, Vermont, Maryland, Delaware, Connecticut, and Rhode Island. Private estimates have previously placed the production in nearly all of these States at much below last year. The July 1 Federal estimate for New York State is 5,647,000 barrels, which is nearly 100,000 barrels above the July 1 estimate of 1922, but 400,000 barrels lower than the final revised 1922 figures. This is also rather contrary to private estimates. The Maine crop is now reported at nearly three times last year's. It is well to remember that at best crop estimates are based upon opinions collected over a wide area which may or may not prove accurate. Indications certainly are for a larger production of apples than was previously expected, but there is no ground as yet for concern over depression of the market in the fall and winter.

The indications are that the pear crop in New York will be little more than half last year, according to the Federal report. California, which is the largest pear State in the country, promises to be over half a million short of last year, while Washington is somewhat ahead of 1922. Both New Jersey and Pennsylvania report outlook for slightly larger production. The total commercial pear crop for entire country is estimated at 15,224,000 bushels, which is very little less than July 1, 1922, estimate, but over 3,000,000 below the final 1922 figures.

POTATOES EASIER

On the New York market, prices have been good. Barrels of the best brands have sold for \$7.25. Just now there is a little easier feeling and the sellers find it hard to get \$7. Some unbranded stock is selling for as low as \$5.50 per bbl.

Long Islands are now arriving from far out toward Orient. Formerly, most have been shipped by boat, but this season it looks very much as if the auto trucks would get all of the business. There is a small fleet under contract with the growers to deliver to the New York markets regularly. Because by trucks potatoes arrive several hours earlier than they would by boat, the growers are pleased with the new transportation. Truckmen from that section are charging from 65 to 75c per barrel.

The Long Islands are selling for from \$6 to 6.50 bbl. The quality is good.

VEGETABLE SUPPLY LIBERAL

Lettuce, green peas, romaine and celery are the principal vegetables being shipped in quantities to New York from up-State sections at present. Receipts of peas and lettuce were especially liberal and the market held steady only for fancy stock. Much of the lettuce was burned and not well-headed. Late deliveries of express shipments of peas caused losses to

many shippers because the best prices are paid in the early market. There seems to be a tendency to let peas mature too much before picking, which means lower prices.

Wholesale prices, representing prices paid to farmers or shippers, minus transportation costs and commission, on July 12 were: LETTUCE—Western New York, best, 75c @ \$1 per crate; few as high as \$1.25; Fulton and Oswego, best, \$1 @ 1.25; Orange County, best, 75 @ 90c; few sales, \$1. PEAS—Madison County, per bushel basket, best, \$1.75 @ 2; fancy, \$2.25 @ 2.50; ordinary, \$1.25. ROMAINE—market dull, per crate or hamper, best, 50 @ 75c.

SMALL FRUITS AND BERRIES

Red sour cherries from Hudson River sections were in liberal supply last week and showed very irregular quality and condition. Red currants and gooseberries were in light supply, but the demand for them was not very active. Raspberries of fancy quality, in good condition, were in demand, but

check American buying in Europe. Reports indicate some shortage in production, but generally favorable conditions at the present time.

The New York market was very firm last week and available stocks were promptly cleaned out. Creamery extras, 92 score, were quoted on July 12 at 39 to 39½c per lb. and scores higher than extras at 39½ to 40¼c.

CHEESE CONTINUES FIRM

The cheese market continues firm with a wholesale price of American cheese, State whole milk flats, fresh, average run 24 @ 24½c, per lb., and fancy fresh 25 @ 25½c. The Wisconsin market is reported firm. Most of the business in New York State flats has been at 25c for fancy qualities with some special marks higher.

STORAGE EGGS MOVING

As a result of the decrease in supplies of fancy fresh eggs, high grade cold storage eggs are already moving out of the warehouses and are tending to reduce the demand for fresh

steady prices, chiefly in range of 15 @ 20c. Early last week two carloads of Canadian dressed calves arrived and sold at 15 to 20c depending on quality.

Live calves were in only moderate receipt and the market for them fairly steady. Choice lambs were also steady and in limited supply; the medium grades moved more slowly. Prime lambs were quoted July 12 at \$16.50 to 17 per cwt. and prime, live calves at \$14.75 to 15.

HAY CROP LIGHT

Unofficial reports from all over the country indicate a light commercial production of hay this year. New York, Pennsylvania and New Jersey crops will be short because of lack of moisture. Ohio and Indiana are reported light. The prospect is for a favorable market for good quality hay.

A quantity of poor hay and trash has accumulated at the New York market and is hard to move. The supply of really good hay is moderate, however, and the market firm. United States Grade Timothy No. 1 sold as high as \$28 per ton last week. United States Sample Timothy which grade includes the ordinary, common stuff, was quoted at \$13 to 18.

WHEAT MARKET TUMBLES

Wheat prices reached the lowest level last week in a nine year period. Wheat in the Chicago market went down on July 11 to 98½c per bu. for September delivery. Unless there is considerable recovery from the present tendency to low prices there will be great losses among the wheat farmers of the West. This situation is due to a considerable extent to a decreased demand in Europe for American foodstuffs and a decline in the European purchasing power. Economists are advising farmers to cut their acreage of winter wheat next fall.

CASH GRAIN QUOTATIONS

Cash grain quotations July 13 were as follows:

NEW YORK—Corn, No. 2 yellow, \$1.07; No. 2 mixed, \$1.06; No. 2 white, \$1.07½. Oats, No. 2 white, 52c; No. 3 white, 51c; ordinary white clipped, 51½c.

CHICAGO—Corn, No. 2 white, 88½; No. 2 yellow, 89@90c. Oats, No. 2 white, 40¼ @ 42¼; No. 3 white, 38½ @ 40c. Barley, 64 @ 68c. Rye, 65c.

Quotations From Eastern Markets

The following are the prices at which farm products of special interest to eastern farmers sold on July 12:

Eggs, Nearbys (cents per dozen)

	New York	Buffalo	Phila.
New Jersey hennery whites uncandled, extras...	43@45
Other hennery whites, extras.....	42@43
Extra firsts.....	37@39	33@35	29@29½

Gathered browns and mixed colors, extras.....	29@33	30@31
Pullets No. 1.....	27@32

Butter (cents per pound)

	New York	Buffalo	Phila.
Creamery (salted) high score.....	39½@40¼	42@43
Extra (92 score).....	39@39½	40@41	40
State dairy (salted), finest.....	38@38½	38@39
Good to prime.....	36½@37½	31@37

Hay and Straw, Large Bales (per ton)

	U. S. Grades	Old Grade Standards
Timothy No. 2.....	\$25@26	\$18@19 \$22@23
Timothy No. 3.....	22@24 19@20
Timothy Sample.....	13@18
Fancy light clover mixed.....	25	21@22
Alfalfa, second cutting.....	28@30
Oat straw No. 1.....	10@12

Live Poultry, Express Lots (cents per lb.)

	New York	Buffalo	Phila.
Fowls, colored fancy, heavy.....	28@29	25@26	27@28
Fowls, leghorns and poor.....	25@28	22@24	23@27
Broilers, colored fancy.....	39@43	43	50@53
Broilers, leghorn.....	35@40	40

Live Stock (cents per pound)

	New York	Buffalo	Phila.
Calves, good to medium.....	12@13½	13@13½
Bulls, common to good.....	4¼@6¼	5¼@5½
Lambs, common to good.....	12@15	16
Sheep, common to good ewes.....	3¼@4	4@7
Hogs, Yorkers.....	8¼@8½	8¼@8½

the bulk of the supply was in poor condition and sold unsatisfactorily. Strawberries were plentiful, coming chiefly from Oswego County. The bulk of them were small and of ordinary quality.

The following were wholesale prices on small fruits in the New York market July 12:

CHERRIES—per qt., black sweet, 18 @ 25c; red sweet, 10 @ 15c; white sweet, 8 @ 12c; red sour, 8 @ 14c; black sour, 15 @ 18c. CURRANTS—per qt., red, 10 @ 12c; fancy large, 13 @ 15c. GOOSEBERRIES—per qt., best large, 17 @ 18c; extra large, 20c; medium, 15 @ 16c. RASPBERRIES—per pt., red, best, 12 @ 14c; few fancy, 15 @ 16c; fair, 9 @ 11c. BLACK CAPS—per pt., best, 10 @ 11c; fancy, 12 @ 12½c; poor and ordinary, 6 @ 8c. STRAWBERRIES—per qt., best, 25 @ 30c; fancy large, 32 @ 35c; ordinary, 18 @ 22c.

SHORTAGE OF STORAGE BUTTER

Cold storage stocks of butter in the entire country were on July 1, about 5,000,000 lbs. short of last year, according to the preliminary report of holdings by the United States Department of Agriculture. This shortage may have been reduced considerably by this time as there is heavy buying for storage purposes, but it indicates that the market for butter will continue very active. In order to make up the deficit, production must keep up at a liberal rate during July as it did during July last year. A quantity of foreign butter principally Danish, is due here before August 1, but the Danish markets are higher, which will tend to

arrivals of ordinary quality. Carload lots of graded western extra firsts sold last week at 28 to 29c per dozen. Nearby white eggs sold fairly well last week, but the scarcity of extra fancy qualities was somewhat relieved. New Jersey hennery whites closely selected extras were quoted on July 12 at 43 to 45c. Average qualities of nearby white eggs sold chiefly within a range of 35 @ 40c, per dozen.

Cold storage stocks of eggs in the four large markets are about 300,000 cases short of last year, although stocks in cold storage at New York are about 30,000 cases more than 1922.

BROILER MARKET WEAKER

The market for broilers weakened a little last week. Prices at end of week were lower than a week previous. The demand for fowls is more active and prices firm for any good stock. Only a few white leghorn broilers of extra large size brought higher than 38c per lb. last week, small sizes sold at 33 to 34c and average 35 @ 37c on July 12. Colored broilers sold at 39 to 43c on that date although the price early in the week was as high as 45c. Express shipments of colored fowls sold on July 12 at 28 to 29c and of leghorn and poor colored fowls 25 @ 28c. Leghorn fowls early in the week brought 27 @ 28c.

DRESSED CALF RECEIPTS LIGHT

Receipts of country dressed calves were light last week and the market for them firm. Fancy handy weight dressed veals brought up to 24c per lb., and possibly higher and prime 20 @ 21c. Small veals cleaned up at

Give a thought to Advertising

NOT so very long ago a man got up and talked about something he didn't know much about. He claimed that advertising made goods cost more for the consumer.

In a recent issue of Collier's Magazine another man, who knows advertising from A to Z, wrote an article that conclusively showed how advertising, instead of increasing the cost of articles, actually decreased it by simplifying distribution.

One advertisement, costing say \$200.00, can place as much of a certain product in stores ready for sale, as five salesmen, working a month can do. And the five salesmen would cost about \$1,000.00 for the same work. Yet either salesman or advertising must be used in distributing a product. The two work best together. Advertising should be used as educational matter, to tell dealers and consumers about the product so that when the salesman arrives on the scene he won't have to waste a lot of time explaining all about the product to each dealer.

The same is true of consumer advertising. For if a buyer knows all about a certain product from advertising he won't have to take up a lot of his and a dealer's time learning about it.

Advertising is also assurance of getting your money's worth. It has been proved that it does not pay to advertise inferior goods. Advertising show up their weak spots. Therefore when you buy an advertised product you can be practically certain that it is a good one.

It may be true that a superior product will be found out in time and the world go to the door of the factory to get it. But it takes time and it costs the world more to go to the factory door than pay the little additional cost of advertising.

Advertising teaches what a product is, how much it costs, what it will do and where you can get it. That's worth a lot in itself. And by doing these things it brings the product to you cheaper than any other method.

Indeed it does pay to buy advertised goods. Then you are sure of getting a good product and getting it cheaper.

Advertising Manager

Farmers Meet Railroaders

Discuss Transportation as It Affects Agriculture

STATING that the purpose of the gathering was to discuss mutual problems and bring about better understanding between the railroads and the farmers, E. V. Titus, president of the Nassau County Farm Bureau, started an important conference of about fifty farmers and railroad leaders at Syracuse on Tuesday, July 10. Leading officers representing the Erie, the Delaware, Lackawanna and Western, the New York Central, the Delaware and Hudson, the New York, Ontario and Western, the Long Island, the Buffalo, Rochester and Pittsburgh, and the Lehigh Valley railroad met with many individual farmers from several of the New York State counties, together with leaders of most of New York's agricultural organizations.

Robert Binkerd, vice chairman of the Committee on Public Relations of Eastern Railroads outlined the railroad program of 1923. Mr. Binkerd said that since Federal control ceased on February 28, 1920, the railroads had reduced operating expenses approximately a billion dollars a year; that out of this reduction over half a billion dollars had been turned back to the public in reduced rates; that about one-third of the reduction had come from decreased wages and the balance from increased efficiency and economy in operation. He said that the income on investment had increased from practically nothing in 1920 to about a 4 per cent return in 1922.

"The railroad's policy," said Mr. Binkerd, "calls for heavier loading and faster moving of freight cars, reduction of cars and locomotives awaiting repairs of carriers, to insure to the highest degree practicable the country's best degree practicable the country's transportation requirements."

The railroad program provides that by October 1, 1923, when the peak of traffic ordinarily begins, they will have their cars and locomotives back in the best condition that they have been since before the war; that by September 1, the coal needed for railway operation will be stored; that a practical effort will be made to bring the average load of all cars up to thirty tons; that every possible means will be used to increase the average daily movement of freight cars up to thirty miles for the entire country.

Mr. Binkerd also said that carrying out this program and simplifying the transportation problem will depend upon close cooperation with the shippers.

N. R. Peet, general manager of the Western New York Fruit Growers' Association, said among other things that the railroads can best meet the needs of agriculture by an equitable distribution of cars, by increasing icing facilities, and by frost protection in shipment.

A. L. Bibbins, seed expert of the G. L. F. Exchange, asked that the shipments of seeds by the railroads be given priority. He made the comment that last year's service in the shipment of seeds by the roads had been done with practically no loss.

K. C. Livermore, president of the Empire State Potato Growers' Association, summed up many points of interest common to both the railroads and the farmers. Looking to the needs of the future, Mr. Livermore said: "In 1913, our population was 96,000,000; in 1923, it was 110,000,000; and in 1933, it will be 125,000,000. This will demand more food, a problem for the railroads as well as for the farmers."

NEW PRACTICES BROUGHT OUT AT CORNELL POULTRY JUDGING SCHOOL

The sixth annual Production Poultry Judging and Breeding school, at the New York State College of Agriculture, Cornell University, closed July 7, after setting a new high mark for attendance enthusiasm and progress.

One of the high points of the week was reached in the lecture by Professor E. C. Foreman of the Michigan Agricultural College on the "Head, Temperament and Appetite of a Fowl as Indications of Production." Professor Foreman indicated that he believed the

head of a bird howed more closely than any other part of the body the capacity for production and that we would place more emphasis on head type in the future.

Professor Foreman pointed out that in order to gauge closely the production of a bird without the expensive and tedious work of trapnesting it, is necessary to know three facts about the bird; first, the intensity or rhythm of production; second, the endurance or persistence of that production, being the number of months over which the bird will lay per year, and third, the time lost by broodiness.

The frequency and length of broody periods have already been proved to be closely related to the shape of the eye-ring, and the intensity and persistency of production, Professor Foreman believes, can also be quite closely gauged from the head type if the observer be trained, aside from the ordinary methods of judging these.

Types of Heads

The following types of heads were listed by Professor Foreman as being most important and common, beside a few minor types:

1. The Crow Head—Overlong from front of eye to base of beak, and shallow over eye to top of head. May be due to inbreeding, poor feeding and rearing or sickness as well as natural low production. Characterized by slow feathering, late maturity, and low winter and annual egg production.

2. The Overly Refined—Usually marked by bright eye and intelligent appearance, but lack ruggedness. May develop considerable intensity, but loses weight under high production, and lacks persistence. The type also has a marked tendency to broodiness.

3. The Refined Type—The head should not cut off in front too abruptly but should have a fair amount of length and a slight ledge over the eye, but not too much. The face should be well filled, not hollow or wrinkled, and the eye should be bulging. This head denotes high intensity, persistency and little broodiness. Refinement, intelligence, vigor and stamina are all shown.

4. Lacking in Character—An expressionless face. Never more than mediocre producers.

5. Beefy Type—Fat face of typically meaty appearance with a placid expression. A typical low producer and tending to extreme broodiness.

"A hen having true laying temperament" said Professor Foreman, "carries its head projecting well forward of its body."

The fine collection of photographs and records shown by Professor Foreman proved that there was ample foundation for his unusual emphasis of head points in judging production, and a need of research along this line.

A particularly practical and timely lecture was given by Professor Philips of Purdue University on "Some Disturbing Factors in the Selection of Fowls for Egg Production." He emphasized the fact that it was absolutely necessary in culling birds for egg production to know the environmental conditions of the flock to be culled. "Judge according to the flock you are working with" said Professor Philips. He stressed the point that feeding is of great importance as effecting both molt and pigmentation in the fowl and that such feeds as alfalfa, clover, or yellow corn mix up the judging for pigment unless the culler is aware of their use, since they tend to maintain a relatively high color under all degrees of production. Many culling demonstrations, the speaker stated, should be feeding demonstrations, since a vast number of birds in our farm flocks never have a chance to show how they could produce. Professor Philips described a large number of conditions and factors, beside egg production, which effect the pigmentation of the hen, as well as effecting other characters used in selection.

\$1000

TRAVEL ACCIDENT INSURANCE

\$1000

For One Year For Only 50c

WITH the development of the automobile industry, traffic congestion has become a menace to both life and limb. Every time one takes a trip by steam or electric train, or goes out for a pleasure spin in auto or buggy, traffic danger awaits him. No one can pick up a daily newspaper without reading the accounts of death and disaster which constantly follow travel activity and travel congestion. As an illustration of this we have but to cite you the fact that during the 18 months while the United States was in the World War 48,000 of our boys were killed in battle.

During the same period 91,000 people in this country were killed in traffic accidents, while serious injuries resulting from the same source destroyed the earning power of hundreds of thousands more for considerable periods of time.

Your Turn May Be Next

This awful toll of death and injury carries with it untold suffering on the part of the dependents. In fact, the suffering of dependents is the worst feature of these appalling disasters.

How To Get This Insurance

All you have to do is to cut out and fill in carefully the coupon on this page and mail to us with \$2.50 which will extend your subscription for American Agriculturist 3 years, and entitle you to the \$1000.00 Travel Accident Policy for one year. You will be protected for one year from the day your remittance is received at our office. The policy will be issued and mailed to you within a few days after your order is received.

Mail This Coupon at Once

J21

To American Agriculturist,
461 Fourth Ave., New York City.

Gentlemen:—Please enter my subscription for American Agriculturist three years and send me a \$1000 Travel Accident Policy good for one year. Enclosed find \$2.50 in full payment for both the policy and subscription.

Signed..... P. O.....

R. F. D. No..... State.....

..... Age.....

(You must be over 16 and under 70)

WE have made arrangements with the North American Insurance Company of Chicago, by which we give you for only 50c a \$1000.00 Travel Accident Insurance Policy, good for one year, provided you send us at the same time your subscription for American Agriculturist at the bargain rate of 3 years for \$2.00.

In other words, you get a \$1000.00 Travel Accident Insurance Policy for one year with a three-year subscription to American Agriculturist, all for only \$2.50.

Here Is How Our \$1000.00 Reader Travel Service Accident Insurance Will Protect You

PART 1

If the Insured shall, by the wrecking or disablement of any railroad passenger car or passenger steamship or steamboat, in or on which such Insured is travelling as a fare-paying passenger; or, by the wrecking or disablement of any public omnibus, street railway car, taxicab, or automobile stage, which is being driven or operated, at the time of such wrecking or disablement by a licensed driver plying for public hire, and in which such Insured is travelling as a fare-paying passenger; or, by the wrecking or disablement of any private horse-drawn vehicle, or motor-driven car in which Insured is riding or driving, or, by being accidentally thrown from such vehicle or car, suffer any of the specific losses set forth below in this part 1, the Company will pay the sum set opposite such loss:

FOR LOSS OF—

Life	One Thousand Dollars (\$1000.00)
Both Hands	One Thousand Dollars (\$1000.00)
Both Feet	One Thousand Dollars (\$1000.00)
Sight of Both Eyes	One Thousand Dollars (\$1000.00)
One Hand and One Foot	One Thousand Dollars (\$1000.00)
One Hand and Sight of One Eye	One Thousand Dollars (\$1000.00)
One Foot and Sight of One Eye	One Thousand Dollars (\$1000.00)
Either Hand	Five Hundred Dollars (\$500.00)
Either Foot	Five Hundred Dollars (\$500.00)
Sight of Either Eye	Five Hundred Dollars (\$500.00)

PART 2

OR LOSS OF—

Life Two Hundred Fifty Dollars (\$250.00)

provided the bodily injury effected as stated herein shall be the sole cause of death of the Insured and such injury occurs:

By being struck or knocked down or run over while walking or standing on a public highway by a vehicle propelled by steam, cable, electricity, naphtha, gasoline, horse, compressed air or liquid power, excluding injuries sustained while on a railroad right of way in violation of any statute or of any regulation of the railroad company.

Indemnity for loss of life as above set forth shall be payable to the Estate of the Insured.

PART 3

If the Insured sustains injuries in any manner specified in part 1 which shall not prove fatal or cause loss as aforesaid but shall immediately, continuously, and wholly disable and prevent the Insured from performing each and every duty pertaining to any and every kind of business, labor or occupation during the time of such disablement but not exceeding three consecutive months, the Company will pay indemnity at the rate of Ten Dollars (\$10.00) per week.

The above indemnities will be paid, subject to the provisions and conditions of the policy. A complete numbered registered Policy will be mailed each person insured. Be sure to read it before filing it away.

This travel accident insurance will protect every registered paid-in-advance subscriber of American Agriculturist, who pays \$2.00 for a three-year subscription, plus a delivery cost of 50 cents paid with this application.

\$1000 Travel Accident Policy and a Three-Year Subscription for American Agriculturist, for only \$2.50

"WHO SAID OATS?"

The Spirit of Neighborliness

No Longer A Haphazard Business

Skill and Training Needed in Modern Agriculture—A Radio Talk

By FRED W. OHM

ONCE upon a time, and it is not many years ago—if Dame Fortune failed to smile upon a man in a trade or a profession, he still found comfort in the thought that if "worse comes to worse we can go farming and at least make a living." And as a matter of fact this was pretty near the truth—when all other efforts failed, the farm was a haven where a man could at least eke out a living. It was hard toil and a living was scant but it was a living nevertheless.

Strange to say, there are folks, more commonly of the big cities, who say to-day that farming is the only life—that it is a life of ease, free from cares and worry—in which it is merely necessary to wait for crops to grow, to harvest all the good things. Some folks get the idea that farmers are rolling in wealth, basing their contention on the fact that prices of foodstuffs at the corner grocer are so high.

It is not many days since I had this impressed rather forcibly on my mind. I chanced to be in a vegetable store and a rather portly gentleman was purchasing potatoes and vegetables. When paying for his produce, he turned to me and remarked, "How fortunate the farmers are, they simply have to dig their potatoes and sell what they do not need for these prices." He had paid 50 cents for 10 pounds of potatoes, at the rate of \$9 per barrel. I told him approximately how much the farmer had

received for those potatoes which by the way, was a great deal less than \$9 a barrel.

And I didn't stop there, but mentioned some of the factors that the farmer, who grew those potatoes, had to figure on. There was cost of preparing the seed bed, cost of seed, cutting and planting it, cost of fertilizer, cost of cultivation and spraying, cost of digging and hauling to market, cost of land and interest on the investment. And on top of that, there was the gamble with the season, with drought, with plant diseases, insects and a flooded or glutted market. The price the farmer received, hardly paid for the risk. The gentleman nodded his head once or twice and departed. He had evidently never thought of those factors.

And yet to-day there are hundreds of "back to the landers" who believe that all there is to poultry farming is to throw some corn to the hens, wait till they lay their eggs and collect and sell them for 50 or 60 cents a dozen. Speaking of poultry keeping as a farm venture, reminds me of the experience of a city man who had the "back to the land" fever. I shall pass the story on as it was told me by a friend of the victim.

This prospective farmer had read a few books on poultry. It all looked so simple and the returns seemed so alluring that he decided that there he would make his fortune. He fell prey to a real estate shark out on Long Island who sold him a small farm for something like \$8,500. I know the section well in which he bought and agriculturally the land is almost worthless. He paid between \$500 and \$1,000 an acre, a real estate valuation. This man knows nothing of the practical feeding problems poultrymen have to meet. He knows nothing of the problems

encountered in raising young stock. He is absolutely "green." Added to this, he has to pay outlandish prices for feeds which his own land is too poor to raise. He has something to learn.

The biggest thing that he will learn, however, the thing that all "back to the landers" soon learn, is that no longer is farming a business for the man who has failed at everything else—a sort of haven of refuge. On the contrary, men who have been successful in business in the city and have tried the farming game, find that with all their business experience they cannot make farming pay. These "back to the landers" will learn that a successful farmer must be a skilled

To produce pork economically to-day, farmers must study such factors as feeding, breeding and selection of type. The ability to raise stock, such as this New York pig club boy boasts of, does not come from books alone. Dad's experience was the background, elaborated by the most recent recommendations of the College of Agriculture.

man. He must know something of the trades for he is called upon to do much of his own work about the place. He must be something of a carpenter to repair his buildings and a mechanic to fix his own machinery. He cannot wait for or stand the expense of high priced artisans. The farmer must be a scientist to identify plant and animal disease and be able to determine how to fight each, after its own manner. The farmer must have unbounded faith that the season will deal kindly with his crops and that his herds will not fall before an epidemic of some new disease.

Years ago, farmers little knew of the Colorado potato beetle, the common potato bug, which to-day calls for the expenditure of thousands of dollars of farmers' money for poison sprays. Years ago farmers knew nothing of the San Jose scale. To-day they must be able to identify it and know how to compound the various spray mixtures to combat this great scourge of the fruit industry. Years ago farmers did not know of bovine tuberculosis and did not have the worries of other animal diseases such as the foot and mouth disease which can quickly wipe out their valuable herds.

To-day the farmer must be a thoroughly skilled and educated business man. Years ago farmers could act independently in their business transactions. To-day they cannot and market their products scientifically. This is evident by the coming into being of the Dairymen's League, the poultry cooperatives of New Jersey and the Petaluma Valley and the great cooperatives of the California citrus fruit growers. They have been forced to organize their own sales agencies in order to get their product to the consumer at prices

the consumers can pay, still leaving them enough to let the farmers know they are working for something besides the fun of it. Even to-day the price received by dairymen for milk does not pay the cost of production plus a reasonable profit.

And what is the agency that is helping the farmer—educating the farmer, if you please,—to meet these new problems. It is the State Colleges of Agriculture as well as the secondary agricultural schools. Obviously the man on the land has not the time, and incidentally very often not the money, to go to college to learn those things he must know to meet all his problems. For him the colleges of agriculture have established their extension or field forces to serve each agricultural county. It has a representative in

each of these counties known as the county agricultural agent who has at his call a large staff of experts and specialists in every line of agricultural endeavor. He prepares field tests in cooperation with farmers to demonstrate improved methods of cropping. He arranges for meetings where farmers may congregate and discuss their problems with specialists in farm crops and animal husbandry.

It is for the next generation of farmers, the farm boys and girls that the colleges are directly functioning. But the work among the youngsters goes back even farther than that. It starts among the boys and girls in the little country schoolhouse in the form of

Junior Projects which are better known as calf clubs, poultry clubs, potato, corn and pig clubs. It is the junior extension program of the college. The youngsters who are members of these clubs have their projects on the home farm—be it a patch of potatoes or corn, a calf, a pig or a flock of chickens. They are told of modern methods of better seed, of pure-bred cattle versus scrubs. In short they are told of the most modern ideas found practical by farmers. A county club agent who is a member of the college extension service, aided by a local adult leader, supervise these clubs and encourage and help the boys and girls.

The greatest good these youngsters get is not the income from a few bushels of potatoes. What they really get is the realization of what it means to take hold of a job and finish it, in short—achievement. Furthermore, they learn to realize the value of ownership which ultimately means thrift. Incidentally by using better methods, they become more interested in the teachings of the college of agriculture and there is created the desire to continue their education.

Education means a greater opportunity for success in farming. In a survey conducted by Dr. C. E. Ladd of the New York State College of Agriculture, it was found that as a man's education increased so did his earning capacity increase—the graduate of the college of agriculture doubling the income of the man who only had a high school education.

American Agriculturist is firmly back of the colleges and the schools of agriculture. As an endorsement of their very great work it has established three scholarships known

The Spirit of Neighborliness

Has It Gone the Way of the Country Church and Doctor?

By AN A. A. READER

AFTER reading—and rereading—with the deepest interest and appreciation the articles on the "Country Churches and Their Pastors" and "The Country Doctor," I am inviting myself "to speak out in meetin'" and inquire: "Where have the old-fashioned country neighbors gone?" I should more correctly ask where has the spirit of neighborliness gone, which was possessed in such brimming measure by those people of one, two and three generations ago!

Most of those good souls have long since gone to their reward; which, if it is measured by their neighborly kindness here, will be a wondrous one.

When someone was sick in our community (and ours was but an example, I am sure, of all such little rural communities) there was somebody at the house with the family continually until the danger was past.

The washing was quietly carried off to a neighboring home and the clean clothes brought back ironed and ready for use. Another neighbor kept a goodly array of eatables on hand. Truly there seemed to be no limit to the thoughtfulness of neighbors at a time like that.

I recall the time when Jim Bird came home from "down East" sick with typhoid fever. He was one of a large family and they all caught the disease except two.

There was sickness in that home for several months and in all that time the family was never alone, one or more of the neighbors being present day and night. Finally, Jim's mother and a sister died, within a few hours of each other. Still the neighbors came, helped in every way.

Occasionally there were most amusing incidents. For example, when Sam Jones was dying, one of the neighbor women and her two nephews were to stay up and care for him one night. Instead of also remaining up, for he knew his father could not live until morning, John Jones and his wife, Em, retired, telling Mrs. T—— to "call them when everything was all over." Mrs. T——'s nephews, lads of perhaps fifteen years, while realizing the situation, saw mostly the amusing side of it, and especially were amused and disgusted by John's callousness.

The house was an old log affair, poorly cared for, and had other tenants than the Jones family, as was evidenced by the sight of a number of bed bugs that appeared on the ceiling of the room where the sick man lay. Noticing these, one of the lads remarked: "Say, Aunt Jane, it's question whether the bed bugs or the angels will get poor Sam first, isn't it?"

The poor old man died that night, cheered by the presence of the "neighbors," when

his own son had left him to face death, alone or not, it didn't matter.

And after everything was all over, Mrs. T——, "called John" as he had requested her.

Most people now, unless those of an older generation, have no time to be neighborly, in sickness or in health. Some of them, to be sure, will run in at a neighbor's at any hour of the day and will sit in at a card game if they can't go elsewhere in the evening, but

each fall. All the rest of the neighbors got a share.

Most always the men in a locality took turns butchering—one would butcher each week after cold weather started in, until all were done. After each butchering, a nice cut of fresh meat was given to each nearby family, thus giving everyone fresh meat over a long period.

At sugaring time, the people who had no sugar bush were generously remembered by those who had.

It was the same the year around. Whatever one had was shared, if there was enough, so sharing was possible, with those less fortunate. Now any one has to hint shamelessly for even an invitation to one of those good old-fashioned "sugar licks!"

I personally knew of one case where people had a lovely bed of tame strawberries almost under the nose of their nearest neighbor, and the latter had a member of his family dying by inches with tuberculosis. Did Number One offer Number Two any berries for the invalid? Why, there might not have been enough for them to can all they wanted if they had! But they'd pick quarts of them every morning in plain view of her bedroom window! Number Two being poor, the invalid had to go without any berries. Think of the treat it would have been for her if she could have had a few.

I'll admit that there are a few of those old-fashioned neighbors who still are among us, but they are few, far between and greatly unappreciated.

It sounds like old "fogyism," truly, for anyone in this enlightened age to say it, but I agree with those who believe that the old times were the *good* times, with the emphasis on the *good*! There are so many wonders and strangely interesting happenings in this old world to-day that it seems to me we are losing sight of the simpler things, and faith in the love that passeth all understanding.

In spite of the vaunted Christianity of those people who "rise up and testify," rant and rave of their religion and their goodness, but if an erring or unfortunate brother or sister needs their charity (in the shape of kindly words, deeds or help in any form,) they too are afraid of soiling their own garments by helping a fallen or needy one. Most of the older neighbors did not stop to figure out, "Am I my brother's keeper." Each did his best for all.

Some may say that if one is neighborly, one will have good neighbors, but that does not always follow. It is hard to do one's darndest for the neighbors and then get no thanks and no help in return. It gets monotonous finally—makes a fellow lonesome, too.—R. M. M.

A Queer Lot!

THE writer of the very interesting article on this page is another one who believes that the "good old times" were best. In sending it in, the writer said, "American Agriculturist has had interesting articles about the disappearing rural church and country doctor. Here is one about the going of the old-fashioned country neighborliness." Is the writer right?

It is strange how few there are that try to defend the present day as compared with the past. Probably the chief reason is that human memory has a habit of forgetting or softening the troubles of the past and emphasizing the pleasant times. But times are made mostly by people and people don't change much through the years. Folks of to-day are on the whole fully as good as they were in olden times and if we believe in progress at all, probably they are a little better. When we of this generation get old we will tell the young folks of 1950 about the good old times back in the 1920's. Aren't we humans a queer lot?—The Editors.

if you are sick and need help, then they are busy!

I heard of an especially good illustration of my argument last winter. Two families living within a half-minute's walk of each other were apparently the best of neighbors for as long as they had known each other. One entire family was taken down with the "flu" and not a soul from the other family entered the house thus stricken, for more than a fortnight, and then only for a call out of curiosity. Finally one out of the first family was called beyond. Then, the other family and all the rest of the neighbors couldn't do enough to help! And they all said, "Why we didn't dream he was so sick," "we thought he was gaining," and so, ad infinitum.

They were so afraid of the "flu," and also worried for fear they would lose time from their own work that they could not possibly have called on their neighbors, though they knew well that the family was all in various stages of sickness.

In those olden times, many generous customs prevailed among the farmers.

At husking time, after a man got a "grist" ground, he shared the fresh corn-meal with his neighbors, giving each enough for several "Johnny-cakes." Likewise with the man who first got his buckwheat ground

Are Farm People For Prohibition?

WE are surprised and gratified by the tremendous amount of interest farm people are showing in American Agriculturists' prohibition poll. Votes are coming in by the hundred. Ballots have been sent to several of the different farm organizations and will be sent on application free of charge to anybody who wishes to see that their neighbors are recorded on this important problem. We are getting hundreds of letters with the ballots, a few of the more interesting of which are printed on the opposite page. Tabulations showing the results will be started in an early issue. Although the majority are for prohibition and the strict enforcement of the Eighteenth Amendment, a surprisingly large number of farm people are recording themselves against it.

Interest throughout the East is being aroused by this vote. It is an opportunity for the farm people to go on record on what is without doubt the most important problem before the American people to-day. Fill in the ballot and get your neighbors to.

Johnson Not Representative

THE election of Magnus Johnson, the candidate of the Farmer-Labor Party for the United States Senate from Minnesota has attracted much comment and interest. He defeated his chief opponent, J. A. O. Preus, the Republican nominee, by a very heavy majority. Many leading newspapers view Johnson's victor over the Republican candidate as an indication of what will happen to the Republican party in the next national election. Others say that the Minnesota senatorial election indicates only a protest of farmers against dollar wheat and the many other troubles with which western farmers have been contending for some time.

American Agriculturist is, of course, in favor of a strong representation of farmers in every Legislature and in Congress. But while Mr. Johnson is a farmer, he is by no means a representative one. He is a radical

of the extreme type, advocating such policies as full sympathy with Soviet Russia and government ownership. He belongs to that class who evidently believe that all farmers' trouble can be corrected by legislation. Samuel Gompers pointed out the foolishness of this in a recent article in the American Agriculturist when he said, "Farmers cannot hope to get help from politicians, but should resort to their own power, their own capacity and their own intelligence." Those who voted for Mr. Johnson will look in vain for the increased prices of their farm products which they hope will come through his election to the Senate.

While there are some radical farmers, especially in our northwest, the great majority are the most stable class of people in America, and it is to be regretted that a man of Johnson's type is in a place to give the world a wrong impression of the real farmer.

What Was Wrong With the Picture?

ON the cover of the July 7 issue of American Agriculturist there was a fine farm picture showing a man cutting clover with a mowing machine. We asked our people to write in and tell us why this man was apparently using poor judgment. There have been several answers, out of which the following were right: H. E. Ankeney, Charlton, Md.; Clayton Young, Camillus, N. Y.; Miss Ardis E. Hawkins, Lake Ronkonkoma, N. Y.; Emma Czirr, Oswego, N. Y.; and Miss Helena Schneikle, Oswego, N. Y.

These people said that the man was apparently cutting heavy clover just before a big rain, which was poor judgment. In our opinion this was the correct answer.

One other said that the man was showing poor judgment because he did not have fly-nets on his horses. Fly-nets are, of course, an aid, but comparatively few farmers are using them. Another answer said that the man was apparently driving his machine right through the uncut clover and was thereby showing poor judgment. This answer was also correct, because if one looked closely at the picture, the mower did appear to be right in the clover.

It is interesting to note that three of those who guessed right are women. Sometimes some of us are apt to forget that some of the best judgment that goes into directing the farm business comes from the women.

More Encouraging

THE July crop estimate of the United States Department of Agriculture predicts a billion dollar increase in the value of farm crops which farmers will sell this season. This is in spite of a 3% decrease in crop acreage farmed. Of course, much may happen between now and the harvest of many of the crops, but a prediction based upon the department's accurate surveys will not likely be far out of the way.

A billion more dollars in the pockets of the American farmers, while not bringing all of his crops up to their costs of production, will do much to increase the general prosperity, and to put more hope and encouragement in the farmer's heart than he has had in several years. It really begins to look as if the tide of the hard times for farmers had begun to set the other way.

Did You Get Yours?

ONE of our subscribers writes as follows: "Last year we waited over fifteen months before the state paid the indemnities on our cattle which they had condemned for tuberculosis. This year we waited a little over two months. It was a pleasant surprise."

American Agriculturist helped to bring

about this very decided and necessary improvement in the payment of State indemnities for slaughtered tubercular cattle. Owing to our insistence and to that of farm organizations and cattle breeders, the Legislature in its last session passed adequate appropriations so that dairymen need not wait such a disgracefully long time for their indemnities as they have in former years.

What Over-Production Does

IN a daily paper which we have before us there is a table showing business conditions with several different commodities, none of them agricultural. The report reads something like this: "Cotton—demand light, prices lower, sharp curtailment in production." All but one of the commodities read about the same way. Each show that the moment the demand lets up, production is stopped or curtailed.

The same paper reports wheat below a dollar a bushel on the Chicago market. The reason for it is too much wheat, but there will be little or no curtailment by the wheat farmers of future production.

The same daily also shows hogs selling for more than a dollar a hundred less than it cost to produce them. The reason is too many hogs. Months ago, American Agriculturist warned farmers to go slow in hog production, predicting a big slump due to over-production. Fortunately for eastern farmers the low prices of wheat and hogs is not so serious as in the West, but all of us East or West, are just the same in our blind disregard of market demands.

When will we farmers learn the lesson that every other business constantly practices, that to avoid constant and disastrous loss we must in some way regulate production to suit the demand?

We Rise to State an Objection

SINCE the candidacy and election of Magnus Johnson, a farmer of Minnesota, to the United States Senate, the newspapers have contained many references again to the "dirt farmer." A "dirt farmer" is supposed to be one who actually works with his own hands on his farm as contrasted with the man who owns a farm but never does any work there himself. The term "dirt farmer" is supposed to be complimentary, but we vigorously object to its use as applied to farm people. Webster's dictionary gives as synonyms of "dirt," "foul, filthy, nasty, squalid"—a nice lot of adjectives indeed to apply to the man who actually works on the land!

The next time you hear some speaker try to compliment you by calling you a "dirt farmer," we advise you to educate him then and there, with a brick or an ancient egg, to the fact that real farmers work in the soil, one of the cleanest and most purifying of Nature's agencies.

Quotations Worth While

Let us hope that one day all mankind will be happy and wise; and though this day never should dawn, to have hoped for it cannot be wrong. And in any event, it is helpful to speak of happiness to those who are sad, that thus at least they may learn what it is that happiness means.—MAURICE MAETERLINCK.

To our shame a woman is never so much attached to us as when we suffer.—HONORE DE BALZAC.

Whether You Are Wet or Dry

You Will Find Consolation On This Page—Be Sure To Vote

By A. A. READERS

WET or dry? First the votes incline the balance one way and then the other. But every letter is so emphatic that we find our readers are not luke-warm, whichever side they favor.

Here, for instance, is a wet who regretfully, but decidedly, differs with our editorial position:

"For upwards of half a century I have read the American Agriculturist; first as a monthly under the late Orange Judd. During all this time I have seen in your columns much to praise and very little to differ with. But even the best of friends may, as the years roll by, find themselves on contrary sides of some grave question.

"In a late issue of American Agriculturist I read a letter scoring the prohibition law and your comments on the question. I am heartily in favor of your correspondents' views and consequently opposed to your stand. Since reaching years of maturity I have known that the saloon was wrong and should go, and would have welcomed a law properly regulating the sale of intoxicating drinks. But the Volstead Act and the Mullin-Gage law were conceived by fanatics and passed, not as an honest expression of opinion, but through fear which a fanatical minority was able to impress upon a supine and vote-craving Congress and State Legislature. The spectacle presented by our Government since the Supreme Court ruling on the Volstead Act must be a cause of sorrow and shame to all loyal citizens.

"The abuses of this fanatical law have made us a nation of lawbreakers. I believe you to be all wrong in your idea of the percentage of farmers in favor of the Volstead Act and the Mullin-Gage law.

Your correspondent speaks of about 70 per cent. against; my opinion would be a much higher percentage against. I have had much to do with farmers in my native State, New York, and also in other States, and my home is in a section that will compare favorably to any, for intelligent and law-abiding farmers, and yet I do not know of one who favors the Volstead Act. They are not saying much—perhaps not one will write you his views on the question. It is the "reformers" who desire to make the whole world as holy (?) as themselves, who are in evidence first, last and always."—W. L. R., New York.

Another friend sets forth his views concisely: "It seems to me a waste of time to argue the question of prohibition. Of course we are for it. All sensible people are. How any person with reasoning powers, can say or think our country worse off since prohibition, is beyond me! The merchants and bankers in our country are pretty good witnesses that trade never has been as good as since the country is dry. Money spent for whiskey cannot buy shoes, clothes or groceries—or swell anyone's bank account but the saloon-keeper's. Those who want whiskey so much ought to be allowed to have enough of the poison stuff to rid the country of them: Prohibition? Yes—and always."—H. R., New York.

A little humor is injected into the situation by Mr. W. R. H. of New York: "Some of the ideas of the 'wets' would make one smile were it not for the fact that they make you mad first, and we find it hard to smile and be mad all at the same time.

"I suggest that the wets get some kind friend to start up a real nice saloon right near their own front door, the nearer the better. Surely they will like to have it there; the noise is so entertaining and soothing in the early morning hours—in fact it usually operates almost the full twenty-four hours daily, Sunday included. A saloon right nearby is easy to get to quickly and it is very much easier to get home again without having to call up the police for support and help.

An Influence on Property Valuation

"Then again, it adds so much to the value of your real estate to have an up-to-date saloon adjoining the property. We notice that nearly all wets believe in and vote for the old license system. This, of course, is the correct way of giving the saloon-keeper the privilege of selling the goods and obeying the law at the same time, and so if Mr. Wet's son, or daughter either, goes over to the saloon next door the first night, and gets gloriously drunk, it is only what might logically be expected to happen, and Mr. Wet has no kick coming, for didn't he vote to give the privilege of selling? If his own children patronize a business of his own making, he ought to be satisfied, and refrain from kicking anyone unless it be himself.

"To my notion at least, most 'wets,' like a

little of the 'old stuff' themselves occasionally. They also like that the saloon shall be near the other fellow's front door rather than their own, and worst of all, they are quite willing to have the goods sold to some one else's children, but they want their own family to be kept clean and straight. How to be 'wet' and not be decidedly selfish at the same time is a thing I have yet to learn.

"Isn't it nice to be able to walk the streets of even old New York City without seeing and smelling a saloon on three of every four corners? Times and laws are far from perfect and the millenium is not here yet but it's on the way and will arrive in due time."

It is not often that a woman comes out so strongly for a return to the old days as does Mrs. A. J. O. of New Jersey. "Here are my views on prohibition. I never intended to vote because I think a woman has all she can do to attend to her home, but I am going to vote this year for the man who will bring back beer. We work hard and how often we longed for a glass of beer, the kind we used to get, and if I could get to Albany, I would pat Governor Smith on the back. Everybody I have spoken to say they don't know how it was put over on the people. Let those who don't want a glass of beer prohibit themselves. Is this a free country?"

Another opponent of prohibition is W. H. H. of Virginia. "I noticed on the Editorial Page of June 16th issue, your letter, also your question, 'Are Farm People for Prohibition?' My answer is emphatically 'no' for the State of Virginia or at least for this section, and I firmly believe it is true for the entire State. While a good many farmers voted for prohibition (simply because they were under the impression that they were doing what was best for the people and State at large), yet, if they had to vote on it again, 49 farmers out of 50 would vote against it.

"Now, Mr. Editor, I cannot agree with you when you state 'there has been a good deal of loose talking and joking about bootlegging, but when all is done and said, there has been less crime, less men in jail for drunkenness, less discord and unhappiness in thousands of American families, and more money to spend for the benefit of all of the family since the Eighteenth Amendment, than ever before.'

"If your statement is true in New York City and State, it surely is not the case in the Old Dominion and the largest portion of the other States, if newspapers are to be believed, as most of them state that more meanness is carried on from making liquor than ever known before.

"If it hadn't been for the 'still and bootlegging' business, prohibition would no doubt have been the best thing ever happened for the entire country; now, it ruins and demoralizes people. I know this is true in Virginia, as at least one-half of the people have a small still, making what they call liquor for their own use and some of their friends, or a large one,

PROHIBITION BALLOT

OF THE
AMERICAN AGRICULTURIST

Are You for the Strict Enforcement of the 18th Amendment as It Now Stands? ☐ YES ☐ NO

Are You for a Modification of the 18th Amendment to Permit Light Wines and Beer? ☐ YES ☐ NO

Designate your opinion by placing an X in the square opposite Yes or No on each question. Sign your name and address. Your name will be kept *strictly confidential*.

Name.....

Address.....

Why You Should Vote

Do the American people want prohibition? The Wets emphatically say "No" and the Drys are even more emphatically for it. Both sides claim a majority. Which is right? What do farm people think about it? The opinions of farmers on any problem, if they will express them, go far in determining the outcome of a controversy.

American Agriculturist is taking a vote of farm families on the question of prohibition. It is a vital issue and whether you are for it or against it, be sure to vote in the spaces above. Mail this ballot to the American Agriculturist, 461 Fourth Avenue, New York City.

Get your friends to vote—More ballots furnished on application

UNADILLA

The Silo of Economy

EVERY dollar put into a Unadilla Silo comes back many times during its long life. Its clever door-fastener safety-ladder makes it possible to preserve the life of a Unadilla indefinitely.

You get at silage easier, put it on the stable level with least effort and make all adjustments in perfect safety.

Successful dairymen praise the Unadilla Silo and buy it a second and third time.

See why the Unadilla is the most economical silo. Write for the big Unadilla catalogue and special discount on early orders.

Alfalfa As A Sod Mulch in the Orchard

And Its Effect Upon the Development of Young Apple Trees

By H. R. HITCHINGS

I READ this question on the editorial page of your July 7 issue and will attempt to answer it. First, I might state that I favor the sod mulch plan, first, last and all the time. I do not say that it is a practical method for all locations or for all men, even if those men were blessed with an ideal location for a sod mulch orchard.

There is approximately one thousand acres of orchard being grown in sod in my immediate vicinity. About two-thirds of this acreage is seeded to alfalfa, the rest to various other grasses. Some of the orchards have a very heavy stand of alfalfa, while others have a light stand. The trees growing in the alfalfa sod are from one to twenty-two years of age and the land has not been ploughed or reseeded since the trees were planted except in a few instances where previous seeding of other grasses was not satisfactory.

I do not think that alfalfa retards the growth of an apple tree; in fact, I know under conditions here that it promotes the growth to a very marked degree, although there might be instances where the alfalfa would retard the tree for a short period of its life, but later this would be more than made up by the increased available supply of nitrogen and humus.

To be more explicit, a young orchard just planted in a heavy stand of alfalfa may not show as much growth for two or three years as a corresponding area under cultivation, but as soon as the tree attains a roothold the effect of the large supply of nitrogen and humus from the rotted mulch will become apparent in the increased vigor of the tree. There are various reasons for this retarding action, all of which, to the writer's notion, may be overcome by judicious management. To begin with, it is not desirable to have a heavy stand of alfalfa, especially if the seeding closely surrounds the apple tree. A lighter stand gives the desired results for most locations, and the light stand does not take up as much moisture from the soil and it does not bother so much in the regular operation of the orchard, such as mowing, spraying, thinning, and picking.

Another matter which has a bearing

on the judicious management of the orchard is the time of cutting. For the best results, to the writer's notion, the alfalfa should always be cut early (10th to 15th of June in Central New

York) and for the first six or seven years raked and placed as a mulch around the trees. The second cutting should be cut and left in the swath.

Placing the mulch around the tree will tend to smother out the alfalfa immediately above the young roots and this will enable the tree to start off at an early age in a very thrifty condition. Four or five years of mulching will about finish the alfalfa under the branches, thus aiding in the mowing and the gathering of the apples. The alfalfa, used as a mulch, deteriorates very rapidly, and the extra nitrogen and humus become available in a short time. This takes the place of cultivation or a nitrogenous fertilizer and allows the grower to bring up an orchard much cheaper than by other means.

A view of one of the Hitchings Orchards—ten years old—consisting of Wealthy and Northern Spy varieties. This orchard has a sod mulch of a light stand of alfalfa. A Wealthy in the left of center of the picture is bending with the heavy load

If the alfalfa hay is removed from the orchard, or if the hay is allowed to stand uncut over a dry period, it will, no doubt, work a hardship on the trees, although there is a block of eight-year-old McIntosh trees on an adjoining farm that has had all of the hay removed since the trees were planted that are in a very thrifty condition and are fruiting well. This orchard is planted on an exceptionally deep rich soil and the trees are thriving without the added impetus of the alfalfa mulch. For ordinary conditions the writer certainly would not advise removing the hay, but, if one is contemplating intercropping, it would be better to grow alfalfa in the orchard and remove possibly part of the crop for monetary return. The orchard will receive some benefit from the nitrogen in the alfalfa, even if a large percentage of the hay is removed and the soil will be left in a better condition than as if under cultivation, as most anyone will agree who has ploughed up old alfalfa sod, and planted this area to field crops. The soil is looser and more friable and the crops seem to respond better.

If any hay is to be removed, take the first cutting, and take it early, leaving enough to cover the ground around the trees for a mulch.

To sum up in answering your question, "Does the alfalfa hurt the tree by taking away moisture?" I would say yes, if a heavy stand is allowed to remain immediately surrounding the tree through periods of drought. If this is cut and a mulch placed around the tree early in the season, I would

say no, the alfalfa cannot harm the tree.

I do not think you will find it necessary to use commercial fertilizer if the aforementioned method of cutting the hay and mulching is followed. Of course, I am speaking of conditions in Central New York where there is a limestone soil and alfalfa thrives. There are some seedings in this vicinity twenty years old that have quite a stand of alfalfa. We have not seen the necessity of applying fertilizer on our orchards seeded to alfalfa. Personally, I believe that our orchards seeded to alfalfa are larger, more thrifty, and much more fruitful than they would have been under cultivation; and, the cost of growing them up to bearing age is a small percentage of what it would have been under cultivation. Our Northern Spys start bearing commercial crops from eight to twelve years of age in the alfalfa sod, other varieties accordingly.

There are some drawbacks, however. Alfalfa forces wood growth similar to cultivation or the heavy application of nitrogenous fertilizer, and it is sometimes difficult to secure the proper relationship between sufficient stand of alfalfa and proper forcing of the tree to secure the largest quantity of well-colored fruit. There is ample opportunity for experimentation along this

line. I have heard it said that alfalfa in the orchard increases the susceptibility of the tree to scab, but to date there has not been any special trouble encountered in controlling scab on the alfalfa-seeded orchards.

Alfalfa retards the ripening of the fruit—this being, at times, a distinct advantage as the length of the picking season may be prolonged. The apples do not color as well if the stand of alfalfa is too heavy and the soil rich. As the trees attain age the stand of alfalfa usually becomes lighter and the color of the apples improves. In fact, much the same result is obtained by the use of the alfalfa-seeded sod

mulch plan as by cultivation and there are many items beside the cost in its favor. The grower can handle a much larger orchard with the same amount of help, a very important item taken alone. The orchard can be planted on hillsides where cultivation would be impractical. Having a larger area situated over various locations as regards aspect and slope of the land insures a better chance of bringing through an annual crop.

This is an eight-year-old McIntosh in an orchard having a heavy stand of alfalfa, which has been cut and practically all removed since the trees were set. It has a fair set of fruit this year.

Long News in Short Paragraphs

THE apple crop in the country as a whole promises to be very fair. In New York State, unfortunately, the crop will be light. Hay is pretty nearly up to average in New York State, but far below the average in other hay-producing sections. Pastures are short everywhere, which means that farmers will have to begin to feed grain early. Dry weather is causing much damage.

* * *

It is reported that wheat is fairly good in New York, and fair in Pennsylvania. In New Jersey it is poor. Dairying is reported good in New York, Pennsylvania and New Jersey, with very good prices. Poultry is doing well in the above States, and potatoes indicate now that the crop will be at least average.

* * *

Alexander Legg, president of the International Harvester Company, in referring to the small returns which farmers receive for their products, said: "If it is true that no nation can endure half slave and half free, then it must be equally true that no nation can long endure where nearly one-third of its toilers, the hardest working third, is miserably underpaid."

* * *

"In the Boston 'Traveler,'" says the National Dairy Council, "of recent issue a whole page was devoted to telling the secret of health and happiness of the most beautiful girl in America. Here is the secret: Eat three meals a day, drink a quart of milk a day, ten hours of sleep, plenty of fresh air and sunshine, and regular exercise to develop the weak parts of the body."

General Manager W. E. Skinner of the National Dairy Exposition, to be held at Syracuse, N. Y., October 3 to 13, announces that the Exposition feels so keenly the increased value of the club department that they have added to the expenses prize money until it now amounts to \$5,500 and that there is close to \$1,000 of cattle club money offered in addition. The executive committee in charge of the department is W. J. Wright, State club leader, New York, chairman; W. H. Palmer, State club leader, Ohio; E. J. Jenkins, State club leader, Maryland; A. L. Baker, State club leader, Pennsylvania, and W. E. Skinner.

* * *

Mr. Charles J. Brand, formerly chief of the Bureau of Markets of the United States Department of Agriculture, has just returned from an extended trip in Europe. He has considerable to say about the great cost of Europe's "Drink Bill."

"I was told," said Mr. Brand, "by men who had given consideration to this subject in England, that their best statistics indicated that in England and in Wales, two gallons of beer were drunk for every gallon of milk."

"European observations," concluded Mr. Brand, "forced the conclusion that ignoring social degradation, crime, increased disease, insanity, and mortality, and looking only at the economic waste avoided, that the United States by sticking to prohibition, even though it may not be thoroughly enforced, will out-distance the nations of the world in the sharp economic competition of the next twenty-five years."

* * *

European countries report that European crops are in general in good condition.

* * *

The National Dairy Show headquarters, Grand Opera House Building, Syracuse, N. Y., have just issued their catalogue announcing the dairy cattle prize list for the coming show. If interested, write for the catalogue.

Among the Farmers of New York

Northeastern State Farm Bureaus to Meet at Albany

PRESIDENT O. E. BRADFUTE of the American Farm Bureau Federation will be the chief speaker at the big Northeastern Conference of Farm Bureau Federations in Albany on August 2 and 3. Mr. Bradfute welcomed the invitation from the New York State Federation as an opportunity to "mingle with the farmers of the East." This will be Mr. Bradfute's first visit to the assembled Eastern federations since his election. His subject will be "The American Farm Bureau Federation in the East."

On Thursday, August 2, at 10:30 a. m., farmers' time, President Enos Lee will open the conference in Chancellor's Hall, Educational Building, Albany. Two days of crowded sessions have been planned by Secretary Underwood, who has charge of the program, as New York is host this year.

Hon. William J. Hackett, Mayor of Albany, will welcome the delegates who will come, it is expected, from Maine, New Hampshire, Vermont, Massachusetts, Connecticut, Rhode Island, New Jersey, Pennsylvania, Delaware, Maryland, and New York. Each State will be heard from at the conference on Thursday. Connecticut will be represented by Walter C. Wood; Delaware by John Ponder; Maine by Julian Emery; Maryland by E. P. Cahill; Massachusetts by H. Russell; New Hampshire by G. M. Putnam; New Jersey by H. E. Taylor; Pennsylvania by J. C. Brubaker; Rhode Island by C. N. Potter; Vermont by E. D. Cornwall; New York by President Lee.

Federation Directors Preside

Each of the three Eastern directors of the American Farm Bureau Federation will preside at a session of the conference. Frank App of New Jersey will take the chair Thursday afternoon. On Friday morning, Frank Smith of New York will preside; in the afternoon he will be succeeded by G. M. Putnam, director from New Hampshire.

A discussion of cooperative buying of farm supplies will occupy Thursday afternoon. The speakers will be H. E. Babcock, general manager of the G. L. F. Exchange and chairman of the New York Cooperative Council, who will talk on "Cooperative Buying and Its Relation to Our Economic Situation," and H. W. Selby, manager of the Eastern States Exchange.

On Thursday evening, at 6:30, the delegates will attend a banquet at the Ten Eyck Hotel. Peter Ten Eyck of Albany will be toastmaster. O. E. Bradfute will be one of the speakers of the evening, and Mrs. A. E. Brigden, president of the Home Bureau Federation, will tell the delegates about home bureau purposes and accomplishments.

President Bradfute's address is scheduled for Friday morning. Following him, and answering his talk, "The American Farm Bureau Federation in the East," Walter C. Wood and H. E. Taylor will discuss "The Eastern Conception of the Farm Bureau."

W. E. Skinner, manager of the National Dairy Show, will tell the delegates his plans for the World's Dairy Congress and National Dairy Show and ask their cooperation and support in exhibits and in attendance. He will speak Friday afternoon.

HORTICULTURAL SOCIETY WILL HOLD ANNUAL MEETING AUGUST 1

The New York State Horticultural Society will hold its annual summer meeting on Wednesday, August 1, at the New York State Experiment Station at Geneva. The farm bureau organizations in the counties are cooperating with the Horticultural Society in the preparation of the program of

the forenoon and the inspection tours and recreation in the afternoon.

The New York State Vegetable Growers' Association has accepted an invitation to join this gathering. The Society cordially invites all farmers and their families, whether member of these organizations or not, to attend the meeting. Secretary McPherson announces that basket lunches may be brought or a light lunch may be purchased on the grounds.

The morning program starts at 10:30 and will be held in Jordan Hall. Dr. R. W. Thatcher, Director of the Station, will make the welcoming address. Responses will be made by Charles S. Wilson of Hall, president of the Society, and R. W. McClure of Syracuse, president of the State Vegetable Growers' Association. The main speakers on the program are Dean A.

Good Advice For Everybody

THE following statement, recently issued by G. F. Warren, farm economist of the New York State College of Agriculture, is such sound common sense that if it were read and followed, it would save much bitter suffering in the future.

"Money prices and wages are normally kept in approximate adjustment by constant changes in each. There is never a time when all things are in adjustment, but by constant fluctuations about a more or less stable base line things are kept within a certain range of normal.

"The war threw things so far out of adjustment that it will be a long time before the fluctuations will settle down to the usual range. Violent mal-adjustments must be expected to continue for some years. Two or three times in the next ten years we may expect periods of severe business depression. It would not be surprising if one of these would be a very trying time.

"In order to be prepared to meet these situations, farmers should be cautious about having large sums of money due at any one time. If farm prices rise enough to make it possible, debts should be paid. Those who have large mortgages coming due in the next ten years, would do well to consider converting them to the Land Bank form before interest rates rise. The ten-year tendency of interest rates may be downward, but the tendency for the next year or two promises to be upward.

"Those who are working for wages will probably never again have a better time for saving money. Some are using this opportunity to go heavily in debt. The wiser course is to save the money now and buy the desired thing in the future, when all or most of the purchase price has been saved."

R. Mann of the State College of Agriculture; the Hon. Peter G. Ten Eyck, member of the United States Congressional Commission of Agriculture, and T. E. Cross of Lagrangeville, who will speak on the plans of the New York Apple Show.

The afternoon will be devoted to a tour of inspection of the grounds of the Station and various demonstration plats. There will be also a ball game between the Horticultural Society and farm bureau members, a tug-of-war between counties, barnyard golf and races.

The eastern summer meeting of the Horticultural Society will be held at the home of W. H. Hart of Arlington, N. Y., on August 4. This will be a basket picnic.

NEW CHAMPION HOLSTEINS IN NEW YORK

Two Holsteins have surpassed former records of production for their age and length of test and are declared new champion butterfat producers for the State by the Advanced Registry.

Stewartford Pontiac Sadie Vale,

owned by J. H. Stewart, Pittsford, N. Y., takes first place for production in seven days as a junior two year old cow. She produced 427.4 lbs. milk and 23.36 lbs. butterfat, equal to 29.16 lbs. of butter.

For production in 365 days at the age of two years and ten months Neva Pontiac Fairmont Lyons, owned by G. N. Smith, Watertown, New York, produced 25,554.2 lbs. milk and 828.70 lbs butterfat equal to 1,035.87 lbs. of butter.

NEW YORK COUNTY NEWS

Oswego Co.—The labor shortage has presented a serious problem in Oswego County. According to A. L. Sheppard, manager of the Farm Bureau, the percentage of vacant farms this year is greater than ever before. This is due primarily to the shortage of labor and high wages. Many farmers have quit operations altogether and are accepting jobs in the trades that offer more money. Another development due to these conditions is that many farmers are working their farms on shares in order that they may be able to work the ground and get aid in planting and harvesting the crops. Some farmers are doing this for the first time in their life.

Indications point to a bumper crop of lettuce from this county. The crop is in an excellent condition and the area under cultivation is larger than ever. While the condition of all muck crops is reported as satisfactory, there will not be as many onions and celery harvested in this county as in former years.

Dutchess Co.—The weather is very dry. Farmers are in the midst of haying. They are obliged to pay \$5 a day for help. With the daylight saving time in vogue in this section, it certainly is working a hardship on the farmer. Some farmers are selling their hay on shares rather than pay the price of help. A large number of city boarders are around this section now.

In Western New York

Monroe Co.—It is not often that one hears of a horse being stung to death. However, this recently occurred just outside of Rochester. A team, belonging to Chester Potter of Rochester, was hauling a load through an apple orchard. One of the horses reached up to snatch a mouthful of leaves from a tree. In so doing it dislodged a swarm of bees which settled on the limbs. The bees immediately attacked the animals, causing them to run away, but they could not escape the bees. The driver, Lee Walters, who was also attacked and severely stung, guided the team to the barn, where both horses were treated. However, one horse died within a few hours.

Market garden thieves have started their depredations in this section. One market gardener particularly, Patrick Corbett of Brighton, has had so much trouble with thieves stealing his asparagus that he applied to the sheriff's office for assistance. Deputy Sheriff E. J. Perkins was assigned to the case. Toward midnight two individuals appeared, armed with shotguns. However, they put down their weapons and began to help themselves to vegetables when they were covered by the deputy with his gun. Both were Italians of East Rochester. They were fined \$50 each.

Steuben Co.—Work of opening up an old ditch through the Arkport area will be started at once, according to reports recently circulated. This will restore some 700 acres of valuable muck land. Reports said that the ditch will be extended to drain an additional 300 acres. Plans for the work have been completed by A. J. Morrison of Rochester, who is division engineer in the State Department of Public Works. The Erie railroad has donated the use of a ditcher and crew to operate it. It is estimated the improvement will cost about \$80,000.

If it is farm news, you will see it in the American Agriculturist.

Jersey Cooperatives Discuss Marketing

Pennsylvania Passes Skimmed Milk Law — Delaware News

STANDARDIZATION of farm products was declared by the several speakers at a conference on cooperation and marketing held in Trenton during the week of July 9, to be the only sound basis for any cooperative marketing movement among farmers. The conference was held under the auspices of the Bureau of Markets of the New Jersey State Department of Agriculture to discuss cooperative marketing.

Practically every speaker voiced the same opinion, namely: that supply and demand alone controls the price of food products and that no attempt of growers to arbitrarily fix prices would succeed. The meeting was attended by members of the cooperative societies already organized in New Jersey, county agricultural agents and agricultural officials who are investigating and studying the cooperative problems as they apply to New Jersey.

Among those present were Dr. H. C. Taylor, chief of the Bureau of Agricultural Economics of the United States Department of Agriculture; Walter Peteet, Director of the Cooperative Marketing, American Farm Bureau Federation; and Dr. Frank App, who represents New Jersey on the Executive Committee of the American Farm Bureau Federation.

In discussing the subject Mr. Peteet said: "If farmers should attempt to fix the prices of potatoes higher than the market and general conditions would justify, they would have an unsold surplus on their hands. If they succeeded in getting prices out of the ordinary they would invite enormous overproduction the next year. Farmers must seek to maintain a price lever that will mean the largest possible consumption of their products. A cooperative that takes a true view of the interest of the farm industry is concerned in the maintenance of price levels that will insure consumption of the entire crop."

NEW JERSEY NEEDS MORE RAIN

Several light showers on the 3rd and 4th of July partially relieved the drought that has been the most severe in spring and early summer in the remembrance of the present generation, writes G. E. Schwartz of Somerset County, N. J. According to Mr. Schwartz, the oats and hay crops are not more than 50 per cent normal. Wheat is about an average yield and corn is very promising. Cherries produced a very light yield, but were of a high quality. Sweet cherries sold readily at \$2.50 to \$3.00 a half bushel barrel. Apples suffered a great deal, especially where growing in sod, and some localities report there is no fruit left.

Since the rain, however, the weather has turned very dry again and in mid-July, New Jersey is again in need of generous rain. Potatoes are very poor, of which there are not many planted. Berries are scarce and high priced. There is a fair prospect for a good peach crop, but both fruit and trees are suffering from lack of rain.

SKIMMED MILK LAW PASSED IN PENNSYLVANIA

The Smith Condensed Skimmed Milk Law, approved by Governor Pinchot as Act No. 361 of the 1923 General Assembly, goes into full force and effect ninety days after the date of approval, or on September 27, 1923.

Secretary Frank P. Willits of the Pennsylvania Department of Agriculture, has issued instructions to the director of the Bureau of Foods, James Foust, to give adequate notice to the trade that after September 27 all canned condensed skimmed milk as defined in the Smith Law must be sold in accord with the new requirements.

The recently approved act, which is a supplement to the Jones Filled Milk Law, states that no condensed, concentrated or evaporated skimmed milk in hermetically sealed cans or receptacles may be sold or offered for sale in the State of Pennsylvania unless such receptacles contain not less than

five pounds net weight. Each can shall have marked, printed or labeled thereon the words, "Concentrated Skimmed Milk, Unsweetened," or "Concentrated Skimmed Milk, Sweetened," as the case may be, and shall be further labeled as being unfit for infants.

Wholesalers and retailers have been given almost three months in which to comply with the new regulations, after which time violations will be vigorously prosecuted by the food officials of the Department of Agriculture. Director Foust, in commenting on the measure, said that it is a most wholesome bit of legislation and necessary in the prevention of fraud and deception in the sale of vital foodstuffs.

The Department of Agriculture hopes that prompt steps will be taken by the trade to remove the banned article from the market and in the future to have all canned condensed skimmed milks conform with the regulations in force by virtue of the Smith Act. Failure to observe the provisions of the law will only result in trouble to the trade and make it necessary to resort to the courts.

EASTERN PENNSYLVANIA NOTES

OLIVER D. SCHOCK

Lancaster County farmers who are thrashing their wheat report that the yield will exceed early predictions. The quality is superior. None but red varieties have been sown, long-berry red predominating. Large shipments will be made for seeding purposes at a considerable advance over average local prices. Many farms average from thirty-five to forty bushels of wheat per acre. Ordinary soil yields from twenty-two to thirty bushels per acre this season.

The tobacco fields of Lancaster and York Counties present a most promising appearance, and thus far no hailstorms have injured the crop. Large growers, almost without exception, carry hailstorm insurance and thus feel more certain of realizing some reward for the losses that storms occasionally incur. The acreage exceeds that of the previous year.

Some Franklin County orchardists will harvest a reduced crop of peaches, as a result of a recent hailstorm which passed over that section of the State. Neighboring counties were more fortunate, as they escaped the visitation of such storms.

The crop of small fruits, although large, proved quite profitable this year, selling at prices exceeding those prevailing during the World War. Cherries were exceedingly plentiful and of special quality. The sweet, or eating, varieties sold in market houses at 25 to 30c per quart, while sour cherries ranged from 10 to 20c a quart. Hundreds of bushels of black and red (sweet) cherries of common kinds were permitted to rot on the trees.

Eastern Pennsylvania's crop of hay was reduced to a minimum yield by a long-continued drought. Some dairy-men will reduce the size of their herds as a consequence, asserting that the high price of hay and commercial cattle feeding stuffs will not permit any margin of profit at the present prices of milk.

The early-planted crop of potatoes throughout Eastern Pennsylvania has proved disappointingly small, due to the unfavorable climatic conditions. The late varieties promise a higher yield, due to more frequent showers. There has not been a general rain since last spring.

DELAWARE FARMERS OPERATE CANNERY COOPERATIVELY

An innovation in the canning industry will be introduced in Seaford during the coming tomato season, farmers having entered into an agreement with the Allen Package Company of Seaford, Del., to operate the canning plant of Colonel Edgar C. Ross on a cooperative plan. The Ross plant would have probably remained idle this season had not the farmers and the Allen Package Company got together. The

plant has been leased by the Allen Package Company, which will receive a small commission for operating the industry, in addition to sharing in the profits derived from the season's pack.

Robert B. Elliott, prohibition director of the State of Delaware, is general manager of the Allen Package Company; William F. Allen, president, and William T. Lank, secretary and treasurer. Mr. Lank, who has had twenty years' experience in operating canneries, will be in charge of the canning plant.

William F. Allen, the president, stated that they had contracts now for about 400 acres, which would be as much as they could handle at the factory this season. The innovation will be watched with much interest and, if successful, no doubt other communities will take up the plan.

In addition, Greenbaum Brothers will operate their plant in West Seaford this season on an extensive scale. They have one of the largest tomato canneries in the East with an enormous capacity. This firm has already contracted for more than 500 acres of tomatoes in this section and the locality around Bethel and Portsville. The tomatoes grown at the two latter places will be brought to Seaford on scows. This firm is still making contracts with farmers to grow tomatoes for them at 25c a basket. Indications are that the coming season will be one of the busiest in the tomato-packing industry ever known in Southern Delaware, and indications are now that we are going to have a bumper crop as some early tomatoes are coming in the market.—K. P. THOMPSON.

We feel lost when we do not get the American Agriculturist. There is always so many valuable items in it, also we liked the "Valley of the Giants."—Henry F. Stock, Jordon, N. Y.

GLOBE SILOS Give Lasting Satisfaction

The GLOBE Silo with its exclusive extension roof enables more silage to be stored than in any other similar sized silo. Adjustable door frame provides against swelling or shrinking. Patent fastener on each door becomes the rung of a convenient ladder. Adjustable hoops together with adjustable door frame make the GLOBE Silo absolutely air-tight—there is no waste or spoilage.

Only carefully selected Oregon fir and Canadian spruce are used in Globe Silos. All metal parts are made from finest steel and malleable iron. Globe Silos give perfect satisfaction for a generation or more. They are the result of 50 years' practical experience.

Prices: \$3.00 per ton capacity and up, according to size. Send for our catalog. Also ask for agency proposition.

No trouble, that. And you insure yourself from trouble.

Whether You Are Wet or Dry

(Continued from page 53)

bootlegging to keep from doing hard, manual labor. I know this is true of the low-class white people and colored race, as you cannot get one to work on the farm at any price. They say they can make from twenty to forty times as much (and make it far easier) in a single night in the woods and oftentimes in the broad daylight.

"Through this section of the country, there has been more meanness and killing and all kinds of accidents since prohibition went into effect than ever before. Two-thirds of the automobile and truck accidents are due to the drivers being under the influence of liquor. It is hauled right by our farm night and day to the nearby cities, towns and villages by automobile and truck loads. We have county court every week, and nine cases out of every ten to be tried are liquor cases. They often cannot get through with the cases for the week. Who can truthfully say that prohibition is a benefit to the country?"

Mr. C. B. of Pennsylvania sets forth his pro-prohibition views clearly: "Your editorial opinion of prohibition, I think, is much nearer the truth as to farm sentiment than that of your correspondent. There are, of course, some who are sincerely opposed to prohibition, but I have not seen any reversion of sentiment in that direction. There are some who fear that there is more chance of their youth getting caught with poison booze than of them becoming law-abiding citizens and while this may be true in particular cases, it is certainly not true of farm boys and girls generally.

Too Soon for Best Results

"But 'knock-out drops,' wood alcohol and fusel oil are not new adulterants; the criminally inclined have been using them for years. Neither are moonshiners nor bootleggers new. Prohibition has not had a chance to show its full benefits, because too many folks have been waiting for it to enforce itself, and as soon as this element recognize their mistake, there will be more insistent demand for thorough enforcement, which is needed. The partial results have more than justified the wisdom of the policy and farmers generally are bright enough to see it, too."

Many correspondents write that they speak for a family or a group of friends. Among them is Mr. F. M. J. of New York. "A week or two ago you requested the farmers' views on prohibition. Speaking for this family; we are dry, very dry, whether light wines and beer or '40-rod whiskey.' If any reason is required, I must confess that I know very little about wines, but have seen considerable beer and whiskey consumed and have never seen a single case where I honestly thought alcoholic drinks, whether light or strong, were of the slightest benefit when used as a beverage, and I have seen many cases where it was an undeniable damage, not only to the drinker and his (or her) family, but often to many others.

"The only real argument in defense of booze is that of personal liberty. Ordinarily the more personal liberty we have, the better, and it should never be needlessly encroached upon, but when personal liberty degenerates into the indulgence of an appetite which does no one any actual good and often damages many (innocent as well as guilty), then that personal liberty becomes a public nuisance and should be firmly and sternly treated as such."

"Whiskey is all right in its place, but its place is off the face of the earth," says C. E. B. of New York, but P. N. of New York writes: "After making a careful study I find that 95 per cent. of farmers in my neighborhood are against prohibition as it is to-day. The rich have a little yet and the poor have a little 'still.'"

"There are ten voters on our farm, all of whom are very anxious for law enforcement," writes R. D. T. of New York. "I am very glad your paper is on the right side."

The result of a Grange vote is mentioned by J. E. T. who says: "During the last year or two that we licensed public poisoning our Grange, Covert, Seneca Co., N. Y. voted several times on prohibition and every time unanimously for prohibition, so you are safe in

saying that 95 per cent of the farmers of America are opposed to establishing the reign of hell on earth for revenue."

An official vote is also given by the letter of F. J. Riley, Secretary of the New York State Grange who writes: "In answer to whether farmers want the Eighteenth Amendment or not and want it enforced, I am speaking for 99 per cent of 140,500 members of the New York State Grange, when I say emphatically, they do. The Grange has always stood for prohibition, not only in this State, but in every State in the Union where there is a Grange. We have laws against all sorts of crime, but still we have crimes committed. Is the way to lessen the crimes, to repeal the laws?—No! Then why repeal the Mullin-Gage Law?"

More pros and cons next time! Meanwhile, register your vote and those of your friends, if you have not already done so.

No Longer a Haphazard Business

(Continued from page 50)

as the American Agriculturist Calf Club Scholarship, to which only boys in calf clubs are eligible. One of these scholarships is in the winter course of each of the State colleges of agriculture of New York, New Jersey, and Pennsylvania. The scholarship in each State is awarded to the boy most proficient in calf club work in the State, who has raised the best calf, kept the best record of his work and submitted the best story of his project. The scholarship pays all the winner's expenses while he is taking the course at the college.

In a recent address, Alfred Vivan, Dean of the College of Agriculture of the Ohio State University, said: "The great need in American agriculture is to encourage the right kind of boys and girls to remain on the farm. The serious problem is not the number of boys and girls who go to the city, but the kind of boys and girls who remain on the farm. If we are to interest the right type of boys and girls in farm life, we must be able to promise them five things, all of which are possible in the farming community, namely: the comforts and convenience of the city home, schools as adequate as those of the city, an attractive social life, a satisfying religious life, and an income equal to that which they could earn in the city."

When one reflects that the net profit realized by clubwork in the United States last year was \$1,500,000, that club members are thrifty and have bank accounts, it is not hard to understand why the efforts of the colleges and schools of agriculture is directed to the boys and girls—the future American farmers, trained to meet the multiple problems of that industry, the feeding of the multitudes.

LIVE STOCK SALES DATES

- August 21-22—Belvidere Farm Jersey Sale, Belvidere, N. Y.
- August 25—Chenango County, N. Y., Guernsey Breeders' Picnic and Field Day.
- August 25—Western New York Guernsey Breeders' Field Day, Westwood Farm, Springville, N. Y.
- August 30—Susquehanna Co., Pa. Holstein Breeders' Second Annual Sale, Montrose, Pa.
- September 1—B. S. Bradford Holstein Dispersal Sale, Troy, Pa.
- September 1—Merridale Farms Jersey Sale, Meredith, N. Y.
- September 21—Eastern Aberdeen-Angus Breeders' Sale, Springfield, Mass., F. W. Burnham, Secretary, Greenfield, Mass.
- September 26-27—Northern New York Holstein Breeders' Sale, Watertown, N. Y.
- October 3-4—National Dairy Show Sale, Syracuse, N. Y.
- October 5-10—World's Dairy Congress, State Fair Grounds, Syracuse, N. Y.
- October 6-10—National Dairy Show, State Fair Grounds, Syracuse, N. Y.

The Brown Mouse — By Herbert Quick

"I DON'T see," said a voice over against the cooking exhibit, "what there is in this to set people talking? Buttonholes! Cookies! Humph!"

It was Mrs. Bonner who had clearly come to scoff. With her was Mrs. Bronson, who was torn between conflicting influences. Her husband had indicated to Bonner and Peterson that while he was still loyal to the school board, and hence perforce opposed to Jim Irwin, his adhesion to the institutions of the Woodruff District was not quite of the thick-and-thin type. For he had suggested that Jennie might have been sincere in her decision, and that some people agreed with her: so Mrs. Bronson, while consorting with the censorious Mrs. Bonner evinced restiveness when the school and its work was condemned. Was not her Newton in charge of a part of this show? Was he not an open and defiant champion of Jim Irwin, and a constant and enthusiastic attendant upon, not only his classes, but a variety of evening and Saturday affairs at which the children studied arithmetic, grammar, geography, writing and spelling, by working on cows, pigs, chickens, grains, grasses, soils and weeds? And had not Newton become a better boy—a wonderfully better boy? Mrs. Bronson's heart was filled with resentment that she also could not be enrolled among Jim Irwin's supporters. And when Mrs. Bonner sneered at the buttonholes and cookies, Mrs. Bronson, knowing how the little fingers had puzzled themselves over the one, and young faces had become flouxy and red over the other, flared up a little.

"And I don't see," said she, "anything to laugh at when the young girls do the best they can to make themselves capable housekeepers. I'd like to help them."

She turned to Mrs. Bonner as if to add "If this be treason, make the most of it!" but that lady was a good diplomat.

"And quite right, too," said she, "in the proper place, and at the proper time. The little things ought to be helped by every real woman—of course!"

"Of course," repeated Mrs. Bronson. "At home, now, and by their mothers," added Mrs. Bonner.

"Well," said Mrs. Bronson, "take them Simms girls, now. They have to have help outside their home if they are ever going to be like other folks."

"Yes," agreed Mrs. Bonner, "and a lot more help than a farm-hand can give 'em in school. Pretty poor trash, they, and I shouldn't wonder if there was a lot we don't know about why they come north."

"As for that," replied Mrs. Bronson, "I don't know as it's any of my business so long as they behave themselves."

AGAIN Mrs. Bonner felt the situation getting out of hand, and again she returned to the task of keeping Mrs. Bronson in alignment.

"Ain't it some of our business?" she queried. "By the way Newtie keeps his eye on that Simms girl, I shouldn't wonder if it might turn out your business."

"Pshaw!" scoffed Mrs. Bronson.

"Puppy love!"

"You can't tell how far it'll go," persisted Mrs. Bonner. "I tell you these schools are getting to be nothing more than sparkin' bees, from the county superintendent down."

"Well, maybe," said Mrs. Bronson, "but I don't see sparkin' in everything boys and girls do as quick as some."

"I wonder," said Mrs. Bonner, "if Colonel Woodruff would be as friendly to Jim Irwin if he knew that everybody says Jennie decided he was to keep his certifikit because she wants him to get along in the world, so he can marry her?"

"I don't know as she is so very friendly to him," replied Mrs. Bronson; "and Jim and Jennie are both of age, you know."

"Yes, but how about our schools bein' ruined by a love affair?" interrogated Mrs. Bonner, as they moved away. "Ain't that your business and mine?"

Instead of desiring further knowledge of what they were discussing, Jim felt a dreadful disgust at the whole thing. Dreadful at being the subject of gossip, at the horrible falsity of the picture he had been able to paint to the people of his objects and his ambitions, and especially at the desecration of Jennie by such misconstruction of her attitude toward him officially and personally. Jennie was vexed at him, and wanted him to resign from his position. He firmly believed that she was surprised at finding herself convinced that he was entitled to a decision in the matter of his competency as a teacher. She was against him, he believed, and as for her being in love with him—to hear these women discuss it was intolerable.

He felt his face redden as at the hearing of some horrible indecency, and while he was raging inwardly, he heard other voices. Professor

Withers, County Superintendent Jennie and Colonel Woodruff were making an inspection of rural-school exhibit.

"I hear he has been having some trouble with his school board," the professor was saying.

"Yes," said Jennie, "he has."

"Wasn't there an effort made to remove him from his position?" asked the professor.

"Proceedings before me to revoke his certificate," replied Jennie.

"On what grounds?"

"Incompetency," answered Jennie. "I found that his pupils were really doing very well in the regular course of study—which he seems to be neglecting."

"I'm glad you supported him," said the professor. "I'm glad to find you helping him."

"Really," protested Jennie, "I don't think myself—"

"What do you think of his notions?" asked the colonel.

"Very advanced," replied Professor Withers. "Where did he imbibe them all?"

"He's a Brown Mouse," said the colonel.

"I beg your pardon!" said the puzzled professor.

"One of papa's jokes," said Jennie. "He means a phenomenon in heredity—perhaps a genius, you know."

"Ah, I see," replied the professor, "a Mendelian segregation, you mean?"

"Certainly," said the colonel. "The sort of mind that imbibes things from itself."

"Well, he's rather wonderful," declared the professor. "I have invited him to make an address at Ames next winter during farmers' week."

"He?"

JENNIE'S tone showed her astonishment. Jim the underling. Jim the thorn in the county superintendent's side!

"Oh, you musn't judge him by his looks," said the professor. "I really do hope he'll take some advice on the matter of clothes—but I have no doubt he will."

"He hasn't any other," said the colonel.

"Well, it won't signify, if he has the truth to tell us," said the professor.

"Has he?" asked Jennie.

"Miss Woodruff," replied the professor earnestly, "he has something that looks toward truth, and something that we need. Just how far he will go, just what he will amount to, it is impossible to say. You won't make any mistake if you make the most of Mr. Irwin."

Jim slipped out of a side door and fled. As in the case of the conversation between Mrs. Bronson and Mrs. Bonner, he was unable to discern the favorable auspices in adverse things. He had not sensed Mrs. Bronson's half-concealed friendliness for him, though it was disagreeably plain to Mrs. Bonner. And now he neglected the colonel's evident support of him, and Professor Withers' praise, in Jennie's manifest surprise that old Jim had a place on a college program, and the professor's criticism of his dress and general appearance.

It was unjust! What chance had he been given to discover what it was fashionable to wear, even if he had had the money to buy such clothes? He would never go near Ames! He would stay in the Woodruff District where the people knew him, and some of them

liked him. He would finish his school year, and go back to work on the farm.

He started home, on foot as he had come. A mile or so out he was overtaken by the colonel, driving briskly along with room in his buggy for Jim.

"Climb in, Jim!" said he. "Dan and Dolly didn't like to see you walk."

"They're looking fine," said Jim.

There is a good deal to say whenever two horse lovers get together. But when Jim had alighted at his own door, the colonel spoke of what had been in his mind all the time.

"I saw Bonner and Haakon and Ez doing some caucusing to-day," said he. "They expect to elect Bonner to the board again."

"If the people want him—" began Jim.

"The people," said the colonel, "must have a choice offered to 'em, or how can you or any man tell what they want? How can they tell themselves?"

JIM was silent. Here was a matter on which he really had no ideas except the broad and general one that truth is mighty and shall prevail—but that the speed of its forward march is problematical.

"I think," said the colonel, "that it's up to us to see that the people have a chance to decide. It's really Bonner against Jim Irwin."

"That's rather startling," said Jim, "but I suppose it's true. And much chance Jim Irwin has!"

"I calculate," rejoined the colonel, "that what you need is a champion."

"To do what?"

"To take that office away from Bonner."

"Who can do that?"

"Well, I'm free to say I don't know that any one can, but I'm willing to try. I think that I shall pass the word around that I'd like to serve my country on the school board."

Jim's face lighted up—and then darkened.

"Even then they'd be two to one, Colonel."

"Maybe," replied the colonel, "and maybe not. That would have to be figured on. A cracked log splits easy."

"Anyhow," Jim went on, "what's the use? I shan't be disturbed this year—and after that—what's the use?"

"Why Jim," said the colonel, "you aren't getting short of breath are you? I thought you good for the mile, and you aren't turning out a quarter horse, are you? I don't know what all it is you want to do, but I don't believe you can do it in nine months, can you?"

"Not in nine years!" replied Jim.

"Well then, let's plan for ten years," said the colonel. "I ain't going to become a reformer at my time of life as a temporary job. Will you stick if we can swing the thing for you?"

"I will," said Jim, in the manner of a person taking the vows in some solemn initiation.

"All right," said the colonel. "We'll keep quiet and see how many votes we can muster up at the election. How many can you speak for?"

Jim gave himself for a few minutes to thought. It was a new thing to him, this matter of mustering votes—and a thing which he had always looked upon as rather reprehensible. The citizen should go forth with no coercion, no persuasion, no suggestion, and vote his sentiments.

"How many can you round up?" persisted the colonel.

"I think," said Jim, "that I can speak for myself and Old Man Simms!"

The colonel laughed.

"Fine politician!" he repeated. "Fine politician! Well, Jim, we may get beaten in this, but if we are, let's not

have them going away saying they've had no fight. You round up yourself and Old Man Simms and I'll see what I can do—I'll see what I can do!"

CHAPTER XV

A MINOR CASTS HALF A VOTE

MARCH was scarcely a week old before the wild ducks had begun to score the sky above Bronson's Slew looking for open water and badly-harvested corn-fields. Wild geese, too, honked from on high as if in wonder that these great prairies on which their forefathers had been wont fearlessly to alight had been changed into a disgusting expanse of farms. Colonel Woodruff's hired man, Pete, had no such foolish notions, however. He stopped Newton Bronson and Raymond Simms as they tramped across the colonel's pasture, gun in hand, trying to make themselves believe that the shooting was good.

"This ain't no country to hunt in," said he. "Did either of you fellows ever have any real duck-shooting?"

"The mountings," said Raymond, "air poor places for ducks."

"Not big enough water," suggested Pete. "Some wood-ducks, I suppose?"

"Along the creeks and rivers, yes, seh," said Raymond, "but nothing to depend on."

"I used to shoot ducks for the market at Spirit Lake," said Pete. "But that's all over, now. You've got to go so far now to get decent shooting where the farmers won't drive you off, that it costs nine dollars to send a postcard home."

"I think we'll have fine shooting on the slew in a few days," said Newton.

"Humph!" scoffed Pete. "I give you my word, if I hadn't promised the colonel I'd stay with him another year, I'd take a side-door Pullman for the Sand Hills of Nebraska—if I had a gun."

"If it wasn't for a passel of things that keep me hyeh," said Raymond, "I'd like to go too."

"The colonel," said Pete, "needs me. He needs me in the election to-morrow. What's the matter of your ol' man, Newt? What for does he vote for that Bonner, and throw down an old neighbor?"

"I can't do anything with him!" exclaimed Newton irritably. "He's all tangled up with Peterson and Bonner."

"Well," said Pete, "if he'd just stay at home, it would help some. If he votes for Bonner, it'll be just about a stand-off."

"He never misses a vote!" said Newton despairingly.

"Can't you cripple him someway?" asked Pete jocularly. "Darned funny when a boy o' your age can't control his father's vote! 'So long!'"

"I wish I could vote!" grumbled Newton. "I wish I could! We know a lot more about the school, and Jim Irwin bein' a good teacher than dad does—and we can't vote. Why can't folks vote when they are interested in an election, and know about the issues. It's tyranny that you and I can't vote."

"I reckon," said Raymond, the conservative, "that the old-time people that fixed it thataway knowed best."

"Rats!" sneered Newton. "Why, Calista knows more about the election than dad knows."

"That don't seem reasonable," protested Raymond. "She's prejudiced, I reckon, in favor of Mr. Jim Irwin."

"Well, dad's prejudiced against him—no, he hain't either. He likes Jim. He's just prejudiced against giving up his old notions. No, he hain't neither—"

(Continued on page 61)

TO REMIND YOU OF WHAT HAS GONE BEFORE

JIM IRWIN has been vindicated. His school passed triumphantly in the very subjects he had been accused of neglecting for "new-fangled notions."

But the enmity of the schoolboard, particularly of Irish Com Bonner, must still be reckoned with. His enemies as well as his friends turn out for the Farmer's Institute, at which Woodruff District school has exhibits and a demonstration of their work. Outsiders begin to be interested and Jim is cheered by an invitation to speak at the Agricultural College, when he is again dashed by a snub from his own board.

Making the Desolate Pine Barrens Bloom

Mrs. Edith Loring Fullerton's Share in the Medford, L. I. Agricultural Development

YOU remember the kitchen most clearly.

That is, if you are a woman. I don't mean that the rest of the house fails to please you, or that you can help being impressed by the blooming condition of the fields and gardens around Mrs. Hal. B. Fullerton's home at the Long Island Demonstration Station at Medford. But any woman would covet that kitchen, with its windows on three sides, its "washing alcove", its stow-away places for shining pots and pans which are still within immediate reach, and its delightful air of comfort, coolness and homey-ness.

Outdoors the sun was beating down with an earnest determination to make up for lost time earlier in the season, but still the kitchen was cool and restful. And Mrs. Fullerton, proud as she is of the station and all it has accomplished, confessed to just a little extra glow of pride in having achieved that kitchen.

"When plans were drawn for the house", she said, "everything was perfect, except for the typical man's idea of a kitchen. I objected. They reproached me with the cost of the room I wanted. But I pointed out that the whole idea of the station and our home was to demonstrate what could be done with natural resources to give Long Island farmers and their wives convenient, modern, and profitable farms and homes. And, I said, to a woman her kitchen was the thing on which her comfort largely depended. I wanted mine 'model' as much as Mr. Fullerton wanted his equipment to be the last word in efficiency.

"Oh yes, they changed the plans, as you see."

More Visitors than Days in the Year

It's just as well they did, for Mrs. Fullerton not only uses the kitchen to minister to the needs of her family but from it she must serve the scores of visitors, invited and unexpected, who yearly invade the Demonstration Station and who usually must be fed. In the last dozen years, Mrs. Fullerton will tell you with perfect cheerfulness, she has given meals to more than 300 visitors annually.

"Sometimes they give us notice and sometimes they just drop in," she said. "Sometimes a whole trainload comes at once and smaller parties are constantly showing up by trains or automobiles. In the old days, when the station was literally out in the wilderness, with no decent roads approaching it and no 'flivvers' to traverse the apologies we called roads then, the trains stopped obligingly right at our front door. Our guests could then walk up the path to the house.

"But now an excellent cinder road connects us with the rest of the world and with Medford, the nearest railroad station."

Only a few steps away from the attractive modern home over which Mrs. Fullerton now presides, is the little portable frame house in which she first started housekeeping in 1906 when the Demonstration Station "opened shop." Now it is used by one of the farm helpers, but its former mistress cannot pass it by without a word of affectionate praise. And hard by, too, is a quaint little shingle building, not unlike an overgrown doll's house, in which the now married daughters once industriously studied their daily lessons.

Living Problems in the Pine Barrens

"We found it had good effect on them to have them 'go to school' even though the school was only a few steps away," said Mrs. Fullerton. "When we first came here there was no possible school for our children so we had to get around that difficulty as well as other living problems. Later, after the girls grew up, we used the little building for all sorts of overflow purposes, and during the war it was canning headquarters for all of Suffolk County."

The presence of numerous food administration posters gave the tiny rooms a warlike atmosphere, while the signed photograph of Theodore Roosevelt, prominently displayed over the great stone fireplace, made known the approval of at least one great Ameri-

can friend of the station and its ruling family. The ex-President and fellow Long Islander was an enthusiastic champion of their effort to demonstrate the agricultural possibilities of "the Blessed Isle," according to Mr. Fullerton.

Not only are all the States represented by the visitors' book at the station, but the whole enterprise is an adventure in internationalism. Visitors come from all over the world to see the thriving fields and orchards, and in these very fields and orchards, plants from every country grow amicably together. As Mrs. Fullerton names them rapidly over—Japanese plums and walnuts, bamboo, tea, almonds, Mexican Teosinte, melons from France, Chinese cabbage, Belgian salads, rubbing shoulders with Long Island vegetables of innumerable variety—she seems to have ample backing for her statement that there is no place like Long Island for natural growth. "Only the South of Japan can equal it," she says, and one cannot blame her for her pride in the

Mrs. Edith Loring Fullerton

conquest of the "scrub oak barrens"—her own part in the conquest, of which she says little, having been that of a valiant warrior against such inanimate enemies as stumps and maggots and such discouraging foes as local apathy, doubt and open distrust.

Everything at Her Finger Tips

So much is the station a part of Mrs. Fullerton's life and so greatly does it depend for its success upon her energy, good humor and shrewd business sense, it is almost impossible to think of one without the other. She knows every detail of the varied work of the place—the blasting, planting, spraying, harvesting, packing; the farm animals; the little dairy building; the farmers' homes and their families; the reports and the heavy correspondence.

At one moment she is finding the year's financial statement to show a visiting European scientist, studying facts and figures spread out on the living room table; at another she is inspecting a fascinating new engine ready for installation. She points out the flowers of her trim little garden, tells of the Sweepstakes prize with which beet culture is being encouraged on the Island, and gives the figures on spring wheat acreage with equal enthusiasm. You are not surprised when she admits that during a three months' leave of absence for Mr. Fullerton, spent helping devastated France, she ran the station as the acting director, taking it through the planting season so successfully that in spite of a curtailed force of workers there was no falling behind in the crops when harvest time came.

Outside her own busy life at the station, Mrs. Fullerton finds time to keep up her work as secretary of the Suffolk County Home Bureau, of which she was the first chairman.

"It is reaching the heart of the home

better than anything else I know," she declared emphatically. "Nor does anything develop leadership more naturally and effectively. I think that perhaps the Farm and Home Bureaus are too closely related; that for its own good, the Home Bureau should stand firmly on its own feet.

"Farming is an ideal profession for woman—so are some of the allied professions which grow out of it—floristry, for instance. Why don't more girls study to be florists? Women are naturally fitted for this trade and I know of several who are making a go of it. My own daughter studied this subject at the Ambler School of Horticulture, but matrimony interrupted her professional career!"

It seems incredible, looking at Mrs. Fullerton, to think of her not only with married daughters but as a grandmother! One can be sure, however, that any babies so lucky as to choose her a grandparent will approve of their selection more and more as they grow older. For few babies can be blessed with a more humorously wise, a more youthful or a more companionable grandmother to teach them the magic of growing things and the happiness of the woman whose lot is cast in with the farm.—GABRIELLE ELLIOT.

DELICIOUS HOME-MADE ICE CREAM

MRS. R. C. KRAMER

ICE cream for dinner! These hot days what could be a more delightful treat to the whole family? Moreover, physicians and dietitians agree that it is one of the most healthful and nourishing of foods. So we, who are fortunate enough to live on a farm where cream and milk are generally plentiful, should have this pleasing dessert as often as possible. In our home, we make ice cream very often in winter as well as summer, and the following original recipes are economical and delicious.

Vanilla (1 gallon)

Three cups sugar; 5 heaping tablespoons flour; 1 quart boiling water; 1 quart cream; 1½ tablespoons vanilla; 1½ quarts milk (about).

Thoroughly mix flour and sugar. Add boiling water, stirring constantly. Place on stove and boil about 15 minutes, or until mixture looks clear and thick. Be sure to stir constantly to avoid lumping or scorching. Remove from fire, stir cream into this mixture. Pour into ice cream can, adding milk until within 1 inch of top. Stir well, flavor with vanilla extract. Set aside to cool. Then place in freezer bucket, adjust turner, pack in layers of finely cracked ice and salt alternately, over which, when full, pour one cup of cold water. Freeze as hard as possible. Repack, set aside to ripen two hours before serving. Good cream can be made by substituting whole milk for the cream and milk in this recipe. Eggs do not improve these recipes.

Chocolate

Same as vanilla, only stir four heaping tablespoons of cocoa into flour and sugar. Mix thoroughly, add boiling water and proceed as with vanilla ice cream.

Peach, Strawberry or Banana

Same as for vanilla, only omit vanilla and one quart of milk, adding instead any crushed sweetened fruit, sweetening fruit in the proper proportion of ½ cup of sugar to 1 cup fruit.

Cherry or Pineapple

Same as vanilla except for three cups of milk substituting that amount of preserved fruit.

Ice Cream Sundaes

We like plain vanilla ice cream served with syrup, as sundaes are served at soda fountains.

Chocolate Syrup

One cup sugar; 2 tablespoons cocoa; ½ teaspoon flour; ¾ cup boiling water; 1 teaspoon vanilla.

Thoroughly mix flour, sugar and cocoa. Add boiling water, stirring con-

stantly. Boil until a medium thick syrup is formed, which will be in about five minutes. Set aside to cool and add vanilla. Serve over vanilla ice cream. If desired, sprinkle chopped nuts over top.

Peaches, strawberries, raspberries, blackberries, or bananas may be crushed, sweetened in the proportion of one cup of fruit to one-half cup of sugar, set aside for an hour or so and served over vanilla ice cream. Shredded pineapple, raspberries, blackberries, or cherries (1 cup of fruit to ¾ cup of sugar) are also delicious with ice cream.

HOW TO KEEP BUTTER SWEET

In keeping butter put up in brine I always had difficulty to keep it from getting that old, stale, strong odor and flavor until a year or two ago, when I tried an experiment.

Simply get a thin piece of cloth and cut in square shaped sizes large enough to hold a pound of butter, then tie up closely and drop into the brine jar. First be sure to work out all water or milk, then let it firm and make into as round cakes as possible. Two-pound sugar bags are ideal to put it in. I put up last fall, just before my cow went dry, about 12 or 15 pounds and it kept nearly as sweet as when first made, and we didn't use the last until June 1. When it is packed down solid in a stone jar or crock, then covered with brine, the brine does not get free access to it, which causes it to get that old, strong taste; but when put up in cloth or small bags the brine gets all in between each package, causing it to keep sweet. When the jar is full, weight with a heavy plate so every cake will be well covered with brine. Be sure to have the brine strong enough to float an egg.—Mrs. W. H. H.

DO YOU KNOW THAT—

A simple and handy method of filling the salt and the pepper shakers is to clip the corner of an ordinary envelope, insert the cut corner in the neck of shaker and use as a funnel. This beats using a spoon. A large corner cut from a very heavy catalog envelope will make a satisfactory funnel for pouring liquids into bottles.

* * *

Put some vinegar in a tin can that does not leak, put in paint brushes, and boil for twenty minutes. No matter how old or stiff they may be this will make them soft and pliable.

* * *

If butter sticks to the molds, rub a little salt on the inside of the molds, after they have been moistened, then rinse with cold water.

* * *

When saving silver that is not in use, polish thoroughly, cover thickly with vaseline, wrap in tissue paper. When wanted, boiling in suds will have it ready for use in a few minutes.

* * *

When putting in hat lining or upholstering furniture, a surgeon's needle is better than an ordinary one. The curved end facilitates the work, particularly on the rounded surfaces.

* * *

The old lament of aching feet is here! Buy two cheap sponges and insert one in the stockings under the arch of the foot. You will be delighted with the relief it gives. They can be easily washed.

* * *

When the meat grinder, egg beater or other cooking utensils need oiling, I always use glycerine around the bearings and the crevices. It is a harmless lubricant and does not later effect the food.

* * *

The burnt taste can be removed from slightly scorched milk by putting the pan into cold water and adding a pinch of salt to the milk.—Mrs. M. M. Mitchell.

* * *

When canning in glass jars, put a silver knife or spoon in the jar; the metal attracts the heat and there is no danger of breaking.

Rocking-Chair Shopping Easiest For Farmer Women

A Stay-at-Home System Described by Mabelle Robert—Other Simplified Home Making Suggestions

WHEN the family wardrobe needs replenishing, I sit down at my desk and make a list of what must be had and the amount I can spare for it all. Then I get out all of my catalogues—I usually have about a dozen from the larger mail-order houses—also a pencil and some cards for taking notes. Those cards, by the way are saved from the layers of shredded wheat biscuits as they are very handy for taking notes.

On a separate card for each catalogue I write headings: page, catalogue number, name of the article, price and information. Under each heading as I look over the catalogues, I mark down the data on articles I want.

When I finish with all the books and all the articles desired are looked up, by carefully going over the cards and comparing prices and values, I decide by a process of elimination where I shall send for my goods. It is then a simple matter to make out the order by referring to the card of the chosen catalogue for page, and number of each article. When the order is completed I go over it very carefully again, to be positive that I am not leaving out any necessary information as to sizes, colors and proper numbers.

Study Before You Order

Many people object to mail-order buying because they "want to see what they're paying for." A careful study of the descriptions will usually enable one to visualize the articles, for the companies certainly describe their goods as to materials, colors and weights, better than the average store clerks.

It will help anyone to read descriptions of various cloths, for instance, both from catalogues and magazine articles; study not only about the goods you know, but about those which are merely a name to you. Most companies handle the various standard goods, known everywhere by the trademark, "Fruit of the Loom" cotton, "Meritas" oil-cloth; Kleinert's rubber goods; and many others which are all so well advertised that their names alone guarantee satisfaction.

There are, also, different standard goods made for each mail-order company, and bearing its trade-mark. Those are exactly described as to quality and are usually as good as the ones mentioned above. In the catalogue of one of the largest mail-order companies, the extreme fairness and clearness of the description is noticeable. In the hosiery "department" for instance, the exact percentage of wool is given in each style. It is seldom one can learn that in a store! A stocking may be called part-wool and have but ten per cent of wool in it.

Last Christmas one of my gifts to "himself" was a pair of suede leather lamb's wool-lined driving mittens, purchased by mail. About the same time a friend bought a pair exactly like mine in a men's furnishing store in our nearest town. But hers cost six dollars and fifty cents, while I paid only two-fifty.

Ever since I began keeping house, my shopping has been nearly all done by mail; and in all my buying for my husband and myself and two babies, there has been just one instance when I returned goods because not satisfied.

Think Over Your Needs

It is always a good plan to decide as nearly as possible on quality of articles, and price one can pay, before looking over the catalogues at all. As a matter of fact, I work out those things in my mind, while I wash dishes or sweep. For example, the youngster's winter hose, shirts, and bands. In our cold northern winters, wool is necessary to keep the little bodies protected, but all-wool goods will shrink and is not as long-wearing as some with a percentage of cotton. Therefore, I decide on getting those garments that are a third or perhaps one-half cotton. Likewise, the cloth for my husband's winter work shirts will be more durable and just as warm if reinforced with cotton.

It always pays to buy the better qualities, so far as one's purse allows. There is so much satisfaction in feel-

ing sure that our purchases are really good, dependable, and lasting. Buy for quality rather than looks, but preferably have both.

In buying wash-goods, it is wiser to pay the extra few cents per yard and get something that is guaranteed washable and non-fading. Notice too, about the width of piece goods. There are several widths of outing, or cotton flannel, for example; the narrowest, about twenty-two inches is a good width for diapers; the second width, about twenty-seven inches, is right for most all children's wear; while the widest, about one-yard is best for nightgowns and like use.

Send Money Carefully

The hints I have given will apply quite as well to buying directly from the stores in your nearby towns, but you will certainly help avoid dissatisfaction when buying by mail. The Post Office money order is about the best way of sending pay for goods. It is cheaper and handier than registering your letter. Cash, stamps, and endorsed checks in an unregistered letter go at sender's risk, and it is an unwise way of doing business.

It seems as if the advantages of mail order buying are legion! It means a saving of time, money and nerves; it offers goods, machinery and everything for home and family; It gives a big choice of styles and prices for those

who buy ready-made clothing, and a wonderfully alluring assortment of materials and colors for the home-sewers; while the styles give the home-seamstress many an idea on the little attractive touches for dresses and children's wear.

FOR YOUR SUMMER CANNING

A suggestion for a home-made steam cooker comes from Mrs. Leon H. Lewis of Prattsburg, N. Y. She writes:

The peanut butter that grocers sell in bulk comes in twenty-five pound tin containers, which when cleaned out make ideal cookers in which to do your coldpack canning. Punch two or three tiny holes in the top with a shingle nail, so that there will be no danger of a steam explosion. If you do not have any inexpensive wire can holders, an old tin cover can be used as a false bottom. Four quart jars can be processed at once and that usually is as many cans as the busy housewife cares to prepare at one time. It also has the additional advantage over the clothes boiler of occupying a very small space on the stove.

HARDY PERENNIAL PINKS

I have had evidence this summer that these old favorites have not been forgotten. I mentioned them in a few articles and was swamped with in-

quiries. I had neglected to say that they were catalogued under the name "Dianthus" and readers could not find them. Dianthus Plumarius is the old clove-scented garden pink, and of recent years these have been improved or added to until we can get finer colors and have varieties that bloom during the summer instead of in the spring alone. Then a new type, Dianthus All-woodii, blooms from spring until fall.

All the hardy pinks can be grown from seeds and fall is the ideal time to sow them. August gives plenty of time for them to get strong little plants by winter, but they may be sown as late as September. A cold frame or protected bed should be provided and the seeds sown in rows four inches apart and kept clean. They are left in the seed bed until spring when they are set out where wanted. Do not hesitate to grow them by the hundreds for they can be slipped in almost everywhere, and you will find very few of your seedlings not worthy a place, for, unlike most hardy perennials, you don't have to grow a hundred to get one good one.—LEWIS COBB.

The Brown Mouse

(Continued from page 59)

I guess he's only prejudiced against seeming to give up his old notions." "Paw says he'll be on hand prompt," said Raymond. "But he had to be p'swaded right much. Paw's proud—and he can't read."

"Sometimes I think the more people read the less sense they've got," said Newton. "I wish I could tie dad up! I wish I could get snakebit, and make him go for the doctor!"

The boys crossed the ridge to the wooded valley in which nestled the Simms cabin. They found Mrs. Simms greatly exercised in her mind because young McGeehee had been found playing with some blue vitriol used by Raymond in his school work on the treatment of seed potatoes for scab.

"His hands was all blue with it," said she. "Do you reckon, Mr. Newton, that it'll pizen him?"

"Did he swallow any of it?" asked Newton.

"Nah!" said McGeehee scornfully.

Newton reassured Mrs. Simms, and went away pensive. He was in rebellion against the strange ways grown men have of discharging their duties as citizens—perhaps a proof that Jim Irwin's methods had already accomplished much in preparing Newton and Raymond for citizenship. At present, however, the new wine in the old bottles was causing Newton to forget his filial duty, and his respect for his father. He wished he could lock him up in the barn so he couldn't go to the school election. He wished he could become ill—or poisoned with blue vitriol or something—so his father would be obliged to go for a doctor. People got dreadfully scared about poison—Newton mended his pace, and looked happier. He looked, in fact, more like a person filled with deviltry, than one yearning for the right to vote.

"I'll fix him!" said he to himself.

(Continued next week)

One housewife says a small magnet is the handiest thing around the kitchen. She uses it to collect spilled tacks, and with a piece of string on it she recovers many a small metal part of stove or sink that would otherwise be lost.

Before you decide to paper that dingy room, try sweeping down the walls with a clean broom, finishing them off with a dry cloth. It may save you a papering bill.

CLOTHES THAT ARE DESIGNED FOR COMFORT

INSTEAD of saying "be careful!" the mother of the youngster who wears No. 1815 can say "Go as far as you like!" A romper like this is ideal for hard play or the quieter amusement on very hot days. Put in sleeves if you like, but small son or daughter will prefer it without.

No. 1815 cuts in sizes 2, 4 and 6 years. Size 4 takes 1 3/4 yards 36-inch material, with 1 1/2 yards ruffling. Pattern 12c (stamps preferred).

EVERY woman finds a middy blouse comfortable and No. 9567 has style too. The band at the bottom makes it fit well at the hips and the smart applied yoke gives it a real sailor effect. The collar and tie are in regulation style too.

No. 9567 cuts in sizes 34, 36, 38, 40 and 42-inch bust measure. Size 36 takes 3 1/4 yards 36-inch material, with 10 1/4 yards of braid. Price 12c.

UNDERNEATH the romper is No. 1619, a dainty "undie" for any little girl. The youngster who is learning to dress herself will find this has the fewest bothersome buttons of any suit she ever had, while she will also love its comfort and freedom.

Pattern No. 1619 cuts in sizes 2, 4, 6 and 8 years. Size 4 takes 1 yard of 36-inch material. Price 12c.

THE three-tiered skirt is very popular this year. No. 1722 combines it with the long waist-line and thus achieves a model which would be becoming to the woman with a full figure. It is shown in figured voile, with plain for trimming.

No. 1722 cuts in sizes 36, 38, 40, 42, 44 and 46 inches bust measure, and size 36 requires 4 yards of 40-inch material with 3/7 yard contrasting and 3 yards of ribbon. Pattern 12c.

PLEATS are decidedly "it." Side pleats are most becoming to the matron, who finds the all-around sort trying. No. 1822 very cleverly lengthens the pleat panels and also shows a neck line and blouse fullness which are graceful features.

No. 1822 comes in sizes 36, 38, 40, 42, 46 and 48-inch bust measure. Size 36 takes 4 1/4 yards 40-inch material, with a 5/8 yard strip for vest and 3 1/4 yards binding. Pattern 12c.

To Order: Be sure your name, address, pattern numbers and sizes are clearly written. Send order with proper remittance to Pattern Department of the American Agriculturist, 461 Fourth Avenue, New York City. You want a summer catalogue, don't you? It is 10c and well worth the money.

Reviewing the Latest Eastern Markets and Prices

FRESH VEGETABLES HIGHER THAN LAST YEAR

HERSCHEL H. JONES

THE New York State Department of Farms and Markets made a comparison of prices at the farmers' public markets on July 19 with the same date in 1922, which shows that on nearly all green vegetables the farmers are getting higher prices now. Long Island tomatoes and white potatoes were almost one-half the price realized a year ago.

The first Orange County onions, both red and yellow, reached the New York market last week and sold at irregular prices, due to the small size and poor quality.

Green corn declined at New York last week owing to heavy receipts from New Jersey and poor quality, selling July 19 mostly at 1½ @ 2c per ear, with a few sales at 2½ @ 3c.

Other fresh vegetables from Long Island and other nearby sections sold in the farmers' markets as follows:

BEANS—Green, per bushel basket or bag, \$1.50 @ 2; fancy, \$2.25 @ 3.50; wax, \$1.75 @ 2.25. BEETS—per bunch, 2 @ 3c; per 3 bu. bbl., \$2 @ 2.50. CAULIFLOWER—per slat barrel, best, \$4 @ 4.50; fancy, \$5 @ 6; ordinary, \$2 @ 3. CARROTS—per bunch, 2 @ 3c; cut, per 3 bu. bbl., \$2.50 @ 3; fancy, \$3.25 @ 3.50. CABBAGE—per head, white, 6 @ 9c; red, 8 @ 10c; Savoy, 7 @ 10c. CUCUMBERS—hot-house, per dozen, fancy, \$1 @ \$1.25; choice, 50 @ 75c; out-door, per 3 bu. bbl., \$6.50 @ 7; fancy, \$7.25 @ 7.50. KALE—per slat barrel, 75c @ \$1. RADISHES—per bunch, red and white tip, 3 @ 4c; black, 4 @ 6c; fancy, 7 @ 8c; white, 3 @ 4c. SPINACH—per 32 qt. crate, Savoy, 75c @ \$1; New Zealand, 35 @ 50c.

Up-State green peas found a dull market last week and supplies were heavy. The quality was much improved. The chief cause for the poor market was the lateness of delivery. The express company delivered shipments to the market so late they had to be held over till next day, and brought much lower prices.

POTATOES MORE PLENTIFUL

Due to heavier arrivals of potatoes from the Eastern Shore, Maryland, New Jersey and Long Island, the market turned quiet. Prices ranged lower. Best brands of Eastern Shore, \$4.50 @ 5 per bbl.; Southern New Jersey cobbles, \$3.50 @ 4.50 per 150-lb. sack; Long Island, \$4.75 @ 5.25 bbl.

Prices have been high enough in the New York City and other large markets to stimulate early digging on the part of many growers. As the season advances this activity will naturally increase and with the greater number of carlot shipments prices in all probability will go lower.

Southern New Jersey is suffering from drought. Some shippers of best stock cobbles around Salem will not be able to begin digging before August 1.

SMALL FRUITS

Oswego strawberries are about ended now. The sweet varieties of cherries are practically finished and the supplies are settling into red sour and black sour. Demand for these for canning purposes was much more active last week. Raspberries of good quality were in active demand and market for them was firm. Gooseberries were in light supply and found a steady market for fancy large stock. Supplies of red currants were liberal, but demand moderate. The following quotations represent wholesale sales of berries in the New York market July 19:

BLACKBERRIES—per qt., best, 22 @ 23c; fancy, 25c; ordinary, 18 @ 20c. BLACK CAPS—per pt., best, mostly 10 @ 11c; fancy, 12 @ 13c; ordinary, 8 @ 9c. CHERRIES—per qt., red sour, 16 @ 18c; black sour, 16 @ 20c; Western New York red sour, 55 @ 60c per 4-qt. basket; black sweets, 75 @ 90c per 4-qt. basket. CURRANTS—red, best, 10 @ 11c; fancy, large, 12c; small and ordinary, 8 @ 9c; black, best, mostly 25c; fancy large, 27 @ 28c; small and ordinary, 20 @ 22c. GOOSEBERRIES—per qt., best, large, 17 @ 18c; fancy,

20c; medium to small, 14 @ 16c. RASPBERRIES—per qt., red, best, 15 @ 16c; fancy, 17 @ 18c; ordinary, 12 @ 13c.

LARGER MOVEMENT OF EGGS

The records of receipts, cold storage movement and stocks on hand in the wholesale market show a larger trade output of eggs since July 1 than last year at this time. The leading egg trade journal estimated the movement of eggs out of wholesale channels the second week in July as 132,672 cases, and the first week as 139,109, compared with an average weekly output in July, 1922, of 113,000 cases.

Receipts of eggs at New York are now running larger again than last year. Very fancy selected hennerly whites continued last week at a top price of 45c per dozen, but the demand was not urgent enough to move all of the stock received without price

supply early in the week and met very active demand. Toward the end of the week, the shipments increased, especially on white Leghorn broilers, and the market tended weaker and lower with large colored broilers selling at 39 @ 40c per lb on July 19; Leghorn, large, at 36 @ 37c. Leghorn, average, 32 @ 35c; small, mixed and Leghorn, 26 @ 31c. Old roosters were quoted at 15c per lb. wholesale; pigeons, per pair, 30c; rabbits, per lb., 35c.

DRESSED CALVES WEAK

Although fresh receipts of country dressed calves were light last week, the demand continued very slow, and prices showed a declining tendency. There were offers of Western-dressed calves at lower prices than country-dressed calves. It did not seem a matter of price, but merely that the stock was not wanted. A few sales of fancy veals were reported at 21 @ 22c. There

League Price For August Milk \$2.43

THE Dairymen's League Cooperative Association, Inc., announces that the following prices have been voted for the month of August, quotations being given for milk produced in the basic zone of 201-210 mile zone from New York City for 3 per cent milk:

Class 1—For milk that goes into fluid consumption, \$2.43, which is 10 cents better than the price in July.

Class 2—For milk which goes into the manufacture of cream and ice cream, \$2.05, which is the same as the July price.

Class 3—For milk used chiefly in the manufacture of evaporated, condensed, and powdered milk and hard cheeses, a differential of 85 cents per hundred has been voted above the price of milk going into the manufacture of butter. This is also the same as July price.

Classes 4a and 4b are the same as in July, with the exception that slight changes have been made in the differentials.

concession. General receipts of nearby whites contain only a small proportion of fancy light yolks and are so irregular in quality that there was a tendency to offer them in mixed lots at easy prices. A large part of the supply had no outlet above a range of 30 @ 38c. Fine medium quality nearbys moved fairly well, however, at around 37 @ 38c. The white egg market has been weakened by recent heavy shipments by boat from the Pacific Coast. The withdrawal of about 15,000 cases of "short held" eggs of good quality from cold storage, also hurt the market for fresh.

SLOWER DEMAND FOR FOWLS

Relative prices of broilers and fowls were somewhat reversed last week from the week previous. Fowls moved slowly and heavier supplies caused considerable declines. Colored fowls on July 19 were quoted at 24c and Leghorn and poor, colored, 18 @ 23c, compared with 25 @ 28c for Leghorn and poor, colored fowls the week previous. Broilers, however, were in lighter

was a fair call for cheaper veals around 14 @ 16c.

Toward the latter part of last week the market advanced 50c for live calves, due to light receipts and a good demand. Prime calves were quoted at \$13.25 @ 14 per cwt., and fair to good, \$12.25 @ 13.

The tone of the lamb market was slow and unsteady. Only prime stock reached top quotation of \$13.75 @ 14 per cwt.

BUTTER SUPPLY MORE LIBERAL

The more liberal receipts of butter last week caused some decline in wholesale quotations, but there was an active buying for cold storage purposes and toward the end of the week the market was quite firm on higher grades. Creamery, extras, 92 score, were quoted July 19 at 38¼c, compared with 39 @ 39¼c the week previous, and 35½ @ 36c on the corresponding date in 1922. Creamery higher score than extra was quoted on July 19 at 38¼ @ 39¼c, compared with 36¼ @ 37c on July 19, 1922. Stocks of medium and lower

grades butter are accumulating in the wholesale market and these are offered liberally at 36c, with sales generally somewhat lower. The market on imported butter is very quiet, due to high prices in foreign markets. The demand for unsalted creamery is slow, creamery unsalted extras, 92 score, being quoted at 39 @ 40c on July 19.

CHEESE STORINGS HEAVY

During the last week there was a rapid movement of American cheese into cold storage and active trading on New York State flats. Up-State prices were relatively high and offerings in the New York market were conservative, with most sales at 25 @ 26c per lb. Toward the end of the week some Wisconsin dealers were offering cheese for prompt shipment at a fraction lower than earlier prices, and the tone in the West seemed somewhat easier.

New York State whole milk flats, fresh, average run, were quoted throughout the week at 25c per lb.

The Federal report as to cold storage holdings of cheese in the four large markets on July 19 showed a surplus of about 3,000,000 pounds above the stocks on hand on the same date last year. The movement out of storage in New York and Philadelphia was somewhat in excess of the movement into storage, but there was a heavy movement into storage at Chicago.

CASH GRAIN QUOTATIONS

Cash grain quotations July 20 were as follows:

NEW YORK—Corn, No. 2 yellow, \$1.08; No. 2 mixed, \$1.07; No. 2 white, \$1.08½. Oats, No. 2 white, 53½c; No. 3 white, 51½ @ 52c; ordinary white clipped, 52½ @ 53½c. CHICAGO—Corn, No. 2 white, 87 @ 87½c; No. 2 yellow, 88 @ 88½c. Oats, No. 2 white, 43 @ 44¼c; No. 3 white, 40½ @ 42½c. Barley, 62 @ 69c. Rye, 63¼c @ 64c.

STRONG MARKET FOR GOOD HAY

Due to scarcity of top grades of hay, the market was strong for them last week, but low grades were hard to sell. On July 19 a car of No. 1 Timothy sold at \$29 per ton, and No. 2 would bring \$28, graded according to Federal grades. New Jersey rye straw selling at \$23 per ton. Receipts of poor and ordinary quality hay in excess of demand.

The following figures as to this year's hay production have just been issued by the New York State Department of Farms and Markets:

	1923 (July Forecast) Tons	1922 Tons
New York.....	6,389,000	6,818,000
New England....	4,247,000	4,476,000
New Jersey.....	275,000	485,000
Pennsylvania....	3,205,000	4,888,000
Del., Md., Va....	1,225,000	1,994,000
Ohio, Ind., Ill., Mich., Wis., Iowa, Minnesota.....	27,654,000	37,183,000
United States....	82,797,000	96,687,000

Quotations From Eastern Markets

The following are the prices at which farm products of special interest to eastern farmers sold on July 19:

Eggs, Nearbys (cents per dozen)	New York	Buffalo	Phila.

Questions About Crops

Paul Work Answers Some Growers Problems

WILLIAM REISERT is one of seven brothers operating adjoining farms at Valley Stream, Nassau County. He gardens some forty-two acres, but his total acreage of crops is far more than this, for most of the land is used twice. He plants four acres of New Zealand spinach. This plant is not a spinach and does not even belong to the same botanical family. It does make high-quality greens in midsummer, when true spinach is out of the running. It grows quickly, is thick-leaved and succulent, and it gives a heavy yield. The New York market accepts New Zealand spinach in quantity during the hot months, though it does not find as ready sale during the spinach season.

What Is a Good Stand of Beans?

M. C. Gillis last year conducted a careful experiment at Cornell to determine the best spacing for garden beans. Three varieties, Red Valentine, a light grower, Stringless Greenpod, making a medium sized plant, and Refugee, which spreads wide, were planted

State College for examination and advice, or to me here at Ithaca, N. Y., and we will try to find out what we can about the difficulty. If I understand correctly, your trouble is entirely different from the ordinary blight or leaf spot which can be controlled by spraying with Bordeaux or by dusting. I shall be glad to hear from you again if I can be of further service.

THE CULTURE OF SCULLIONS

Kindly give me some advice on planting, cultivation, fertilization and harvesting for so-called winter onions or scullions?—D. Y. G., Pennsylvania.

I assume that you want bunch onions to sell in the spring. For this purpose two kinds of onions are commonly used; multipliers and Egyptian, or tree onions. The former are perhaps more commonly used, and they multiply by division of the bulb underground. Part of the planting is left after the market crop has been pulled in the spring and by fall each set has developed a number

How a practical potato grower modified his power duster. The canvas concentrates the dust cloud about the plants

and thinned to stands of two, three and six plants per foot. With all varieties the close planting was favored. The work is being repeated this year, with an added stand of 12 per foot.

We would like to hear from gardeners on this subject. Does your experience check the experiment? Do you think the stand of twelve per foot will prove too thick? A postal will do.

"BURN" IN CELERY

I have been troubled with "burn" in the hearts of yellow celery. During last September and October when the plants were about mature, the leaves and stalks of the hearts turned brown, then black and finally rotted. This season fully 90 per cent of the plants were affected. Is this due to type or condition of the soil, location, exposure or faulty culture? I have been growing Golden Self-blanching only two years. This year the burn was much more serious than last year. Green and Easy Blanching rarely show a burned stalk. I do not spray either variety and have little evidence of blight, unless this is a kind of blight.—W. L., Pennsylvania.

As far as I can learn, not very much is known of this particular trouble. In the trial gardens at Ithaca we have suspected that trouble such as you describe is worse where the water supply is not adequate. We have not been troubled with it on varieties other than Golden Self blanching. The pathology people say that the cause is not very definitely established, and they suspect that it is somewhat similar to tipburn in lettuce which is sometimes occasioned by the inability of the outer portion of the leaf to get sufficient water. I doubt if spraying will help materially. I should try giving at least a part of your field a heavy application of well rotted manure this spring. Leaving a bed of ground unmanured, you would have a check on this treatment. I should watch weather conditions also and see if you can note any connection between drought and the trouble. If you have irrigation equipment, the effect of water would also be worth studying.

I would suggest that next season you send sample plants either to the Penn

of small bulbs. These may be taken up and replanted for the next season. They are very hardy, and will remain in the ground year after year, but this is hardly good commercial practice. Plantings are usually made about six weeks before freezing weather, and they make a start in the fall, so that they can get on very rapidly in the spring. Sometimes they are given a little protection in the form of a mulch of straw or strawy manure.

The Egyptian, or tree, onions are reproduced by means of small bulbs which develop on the top of the plant where seed forms in the ordinary onions. With these also a part of the planting is left after bunching in the spring. The bulbs are harvested when mature and are set out again in the fall.

The onion bulb of either kind may be planted rather thickly in rows twelve or fifteen inches apart. They are given ordinary cultivation to keep weeds down, and are ready for bunching without very much attention. They are ordinarily grown on rich market-garden ground which has had an abundance of manure year after year, and so commercial fertilizer is not necessary. When they get large enough for bunching they are pulled, the rough outer leaves and skin are removed, and they are tied four to ten in a bunch, according to market custom, and sold. If we can help you further, please let us know.

Cereal Pests—Before threshed wheat is placed in the bins, sweep them out well, removing all of last year's grain, and fumigate the bins with carbon bisulphide before putting in the new wheat. If this is not done, and the wheat begins to heat, fumigate with the bisulphide, using one pound to 100 bushels of grain.

A FREE TRIP TO NEW YORK CITY

FOR EVERY BOY AND GIRL

between the ages of 12 and 21 who sells \$50.00 worth of subscriptions for American Agriculturist between now and August 22, 1923. This offer is open only to boys and girls living in one of the Middle Atlantic States or the New England States.

WHAT THE TRIP WILL INCLUDE

All contestants qualifying for the trip will have all their traveling expenses paid to and from New York and also all expenses for the two days they are our guests in New York City, August 29 and 30.

During the two days' stay in New York City the program will include a trip to one of the leading theatres, a visit to the Museum of Natural History, the Bronx Zoological Gardens, a Sight-Seeing Bus Trip around New York, a visit to the New Markets and Water Front, the Woolworth Building, a trip on board an ocean-going liner and as many other extra trips we can find time for in the two days.

New York City is the greatest city in the world and every young American should take pride in visiting this wonderland. You may not want to live in New York, but you have only half lived until you have visited it and seen its many tremendous buildings, beautiful parks, museums, famous subways, etc.

The Woolworth Tower, a visit to the top of which is included in the free trip

YOU ARE SURE OF BEING REWARDED

If for any reason you should discontinue getting subscriptions before reaching a total of \$50.00, we will pay you a cash commission of half the amount you have sent us for subscriptions, provided you have sold at least \$10.00 worth of subscriptions.

BOYS AND GIRLS! REGISTER NOW

Don't take any chances of missing this wonderful trip. Fill out the coupon below immediately so that we can register you as one of the contestants and send you necessary supplies free of all expense. But don't wait for any supplies. Start getting subscriptions now—this very day.

Remember the trip is not at all competitive, so that if you sell 50 subscriptions for American Agriculturist between now and August 22nd, 1923, you will win one of the free trips to New York City, no matter how many others qualify for the same great treat.

Mail This Coupon At Once

MANAGER FREE TRIP BUREAU
American Agriculturist
461 Fourth Ave., New York City

Please count me in on the free trip to New York City. Send me necessary sample copies and other supplies together with instructions. I will do my best to sell at least \$50 worth of new or renewal subscriptions for American Agriculturist before August 22. In case I fail to get \$50 worth of subscriptions it is understood that you will pay me a cash commission amounting to half of the money I receive for American Agriculturist subscriptions, provided I send at least \$10 worth of subscriptions.

NAME.....

ADDRESS.....

HOW TO GET THE FREE TRIP

All that is necessary to get all your expenses paid on this trip to New York City is for you to sell \$50.00 worth of subscriptions for American Agriculturist. Send your orders in each week. No orders will count if mailed later than August 22nd.

In order to reach your goal of \$50.00 worth of sales quickly, you may sell five years for \$3.00 or three years for \$2.00. Of course, you may also sell one year for \$1.00. It is clearly to your advantage to get the long-term subscriptions because you require much less of them. For instance, 25 three-year subscriptions at \$2.00 each will be easier to secure for most contestants than 50 one-year subscriptions at \$1.00. The big point to remember is that your total subscription sales must amount to \$50.00 in order to entitle you to the free trip. Renewals count the same as new subscriptions.

" 'Bout Time Pa Bought a Washin' Machine "

Cooperatives Must Not Fail

An A. A. Radio Talk Broadcast from WEAFF, August 1, at 6:50 P. M.

WHEN Editor Ed, as those of us who know well the elongated farmer chap who weekly gets out the American Agriculturist, asked me to broadcast for him, he very kindly refrained from naming my subject. I am glad of this, for it enables me to take liberties with a great opportunity and to say some things which I have been anxious to get before both farmer and urban residents for a long time.

First, I want to get over a message to my farmer hearers in which I believe I will have the support of the thoughtful business man. It is about the cooperative associations which they have developed in such large numbers during the last few years. Farmers, even after they have participated in the organization of a cooperative and become members of it, are apt to think of it as something apart from themselves. As a matter of fact, cooperative associations or corporations as I like to think of them, belong to the farmers and the whole responsibility for their successful organization and operation, goes back to the men who make up the membership. Through their cooperative associations, farmers have an opportunity to prove themselves in business, or a big chance of failing so miserably that they will become the laughing stock of other business interests in the country.

As a matter of business or a matter of pride, farmers cannot afford to fail. Yet from my intimate knowledge of the operation of cooperative enterprises I want to make this point very forcibly: Farmers will fail with their cooperatives unless they stop thinking of such organizations as the Dairymen's League Cooperative Association and the G. L. F. Exchange as "those fellows" and instead think of them as *my* organization and *my* property to be safeguarded and used as such.

In this same connection I want to point out to my hearers who live in cities, and particularly to those in the small cities and towns, which are largely dependent upon rural prosperity, that they cannot afford to do anything which will result in the failure of the great cooperative marketing movement. Thousands of farmers are involved in it.

Let them fail and there will not only be a serious economic reaction which will hit every citizen, but what is of more vital importance, the spirit of hundreds of good men will be broken and their morale weakened. This, coming at a time when our nation is

By H. E. BABCOCK
Chairman of the New York State
Cooperative Council

nervous and worried, would indeed be a serious blow to the security of the country as a whole.

So much for the responsibility which the cooperative marketing movement puts on the shoulders of both the farmers who started it and the other citizens of our country who stand to benefit by its success or lose

have not been in the past adapted to their uses nor in accordance with the latest findings of the experiment stations. The purchase of useless farm supplies by farmers, constitutes a direct economic loss for them and the communities in which they live.

With farming conducted on as close a margin as it is at the present time, the high sales costs which have to go into the merchandising of necessary and useful farm supplies, to meet the competition of those which are unnecessary and useless, constitutes a

tax of unbelievable magnitude, for in the last analysis the sales cost always adds to the price of the commodity.

Take the case of dairy feeds, one of the largest items purchased by farmers. I personally recall a night when fourteen high priced feed salesmen sat around the supper table in a little country hotel. They had all called that day, on the two or three feed dealers in that town. They all drove automobiles; they all ate good meals; they all slept in good rooms; they got good salaries. And the farmers in the community absorbed the cost.

They tell me my time is getting short but before I close I do want to speed up enough to ask these questions. Why should farmers continue to throw away their money through the purchase of low analysis fertilizers; of imported and southern grown leguminous seeds or seed adulterated with such stuff which will winterkill the first winter as sure as it goes into the ground; of manufactured dairy feeds sold primarily to carry off some by-products, or of feeds high in fibre, or of feeds whose digestibility cannot be known? Why should they, another year, continue to support a great army of high priced skillful salesmen to sell them such goods when

they are short of men to milk cows and pitch hay? It is about time that the rural business man and the business farmer got their heads together and agreed, the one to keep abreast of the development of science and handle for his farmer patrons only those supplies which are valuable in farm practice and which are needed.

To my mind, nothing that farmers are doing to-day, is costing them so much as the scattering of their buying volume, first locally, second in a wholesale way. Many local retailers lack sufficient volume of business to permit him to perform in an efficient manner the services which he renders the community. Manufacturers of feeds and fertilizers and distributors of seeds are in

(Continued on page 74)

41 Park Row As It Looks To-Day

through its failure fully as much as the farmers.

The next thought that comes to me also relates both to farmers and to city and town dwellers, particularly to those business men who furnish farmers with their supplies. Because of the abundant energy and resourcefulness of the business men of this country, as well as the urge of competition, there have been developed great merchandising organizations for the purpose of selling to farmers hundreds of items of farm supplies. Many of these farm supplies have no place on the farm and are put there only through the superior merchandising ability of the organizations marketing them. Again, a lot of the staple supplies which are sold farmers, such as fertilizer, seeds and feeds,

American Agriculturist

THE FARM PAPER THAT PRINTS THE FARM NEWS

"Agriculture is the Most Healthful, Most Useful and Most Noble Employment of Man"—Washington

Reg. U. S. Pat. Off.

Established 1842

Volume 112

For the Week Ending August 4, 1923

Number 5

Home of the American Agriculturist, 41 Park Row, in 1860

HERE is another picture, reprinted from an old American Agriculturist published in September, 1860. It shows a part of Park Row, the busiest section of downtown New York in 1860.

In order to bring out the contrast between then and now, we have printed on the opposite page a picture of Park Row of 1923. You will, we think, be much interested in

studying the details of this old picture. Note the horse-drawn street cars, the one-horse two-wheel carts, the silk hats of the gentlemen and in particular the very voluminous skirts of the ladies.

Of all those adults in the picture, who were just as busy then as we are to-day with their little comings and goings, probably not a one remains. In thinking of this as we

study the old picture, we were impressed with the general uselessness of most of the things we now think are so important. Of all the work of those you see in the picture, not a thing counts to-day, sixty-three years later, except the comparatively few acts they rendered for the permanent benefit of their fellows. So it will be with us and our works. —The Editors.

VOL. 112 August 4, 1923 No. 5

The Prohibition Vote

WE are now getting upwards of two hundred letters and votes on the prohibition issue every day and the number is on the increase. Let them come! Before we get through we hope to register enough farm votes to definitely tell the general public just where the farmer stands on this important question. On the opposite page are some more letters right straight from the shoulder. Be sure to read them, and above all, be sure to vote, for this is the most interesting and most important problem in America to-day. If you will do your part and register your opinion, we will do ours and pass that opinion on where it will do the most good. If you have time, we are glad to have your letters, too. We do not have room to print them all, nor time to answer them all personally, but they are all of them helping us in determining farm sentiment. We ask the writers to accept this statement of appreciation in place of a personal letter.

Quantities of ballots will be furnished upon application. Get your Grange, any lodge or church or church society, providing its members are from country districts, to send in their vote. We will soon begin to print the results.

Automobile Pests

EVERY good thing leaves evils in its wake. The automobile is no exception. Two things in particular that the automobile has brought, make constant trouble for farm people. One of them is the automobile thieves who load their cars full of the farmer's fruit and vegetables; and the other is those who have so little regard for the beauties of the countryside, that they always leave a nasty litter of papers and other rubbish behind them.

It is well for our faith in the natural decency of average folks that there are after all only a comparatively few in either of the above classes, and in order to be perfectly fair, we must admit that not all of either the automobile thieves or the litterers are

from the city. It seems to be a trait of certain people, whether they live in the city or country, to throw off all restraint, courtesy and responsibility as soon as they get out of their own neighborhood.

The only cure for such hogs—for that's about all either of the classes are—is rapid and effective punishment. No person or persons caught stealing should be let off easily. On the other hand, let us not inflict punishment where it is not due. Over half of the people who go camping in cars are farmers. It is unfortunate for these as well as for decent city people to have to meet with a gruff refusal when they ask for some little courtesy, like stopping for a drink or a place to camp, because of the prejudice that has been aroused by the comparatively few who should never be allowed on the highways.

When Money Fails

Though marks are produced by the ton in Berlin,
On the pavements they uselessly flutter,
And nobody bothers to gather them in,
For the standard of value is butter!
The people are losing their rose-ruddy tint
And fast growing lanker and lanker,
For from Kiel down to Munich the cow is the mint
And the neighborhood grocer the banker.
—MONTAGUE, in the New York "Tribune."

IF you were ship-wrecked on a desert island, all the gold or paper money in the world could not save you from starvation. Germany's money at the present time is a sad example of what happens when the money is not backed by fundamental wealth. Farmers are the greatest producers of real wealth, but it is only in times of great crises that individuals and nations realize the fundamental importance and necessity of food production.

Making people realize this fact has been one good result of the World War. Not in fifty years have the people of all the world talked so much about farm problems as they have recently. We no longer read in the city papers the would-be funny references to the hick farmer, or do we hear so much about the great amounts of money that farmers make. Everywhere there is more sympathy and understanding of the problems of the men who produce the food that all must have, in order to live.

Market Service Saves Money

WE are getting a good many letters from farmers about our radio service. We are very glad that this is appreciated and that it is saving our people a lot of money by giving them information that helps them to market their crops to better advantage. Just to refresh your minds, let us again say that we are giving two kinds of radio service.

Every Tuesday, Wednesday, Thursday and Friday morning at 10:50 A. M., eastern standard time, we furnish in cooperation with the New York State Department of Farms and Markets, through broadcasting station WEAf the latest prices on all farm products in the New York City market. If there is a radio in your neighborhood, be sure to make arrangements with the owner to get these quotations. Blanks for taking them down will be furnished free of charge upon application to American Agriculturist, 461 Fourth Avenue, New York City.

Then every Wednesday evening, at 6:50 P. M., eastern standard time, through broadcasting station WEAf, we are giving short talks on farm subjects by some of the greatest leaders in America. Among those who have already spoken on this program are: Enos Lee, President of the New York State Farm Bureau Federation; John D. Miller, President of the National Milk Producers' Association and Vice-President of the Dairy-men's League Cooperative Association; Mrs. A. E. Brigden, President of the New York State Federation of Home Bureaus; Dr.

Royal S. Copeland, New York State Senator; H. J. Kenner, President of the Better Business Bureau of New York City; Albert Manning, Master of the New York State Grange; Alva Agee, Secretary of Agriculture of New Jersey; Miss Gabrielle Elliot, Household Editor of American Agriculturist; Herschel Jones, formerly chief of the New York City office of the State Department of Farms and Markets; Jared Van Wagenen, Jr., New York State Farmers' Institute Lecturer and contributing writer of American Agriculturist; Henry Morgenthau, ex-Ambassador to Turkey; Nathan Straus, Jr., Chairman of the Agricultural Committee of the New York State Senate; F. P. Willits, Secretary of Agriculture of Pennsylvania; E. R. Eastman, Editor of American Agriculturist; Fred W. Ohm, Associate Editor of American Agriculturist.

Some of those who will speak in the near future are: H. E. Babcock, General Manager of the G. L. F. Exchange; Berne A. Pyrke, Commissioner of the Department of Farms and Markets; and R. P. Snyder, Director of the Bureau of Rural Education of the State Department of Education.

More Emphasis on Eastern Products

A FEW days ago we were visiting with a manufacturer in New York City about farmers and farming. The city man expressed the thought that farmers are not getting a square deal, and that it was very bad business for the country as a whole that agriculture was so out of balance with other industries. "However," the manufacturer added, "this does not mean much to New York State because there is really so little farming here." He expressed some surprise, and we don't know yet that he really believed us, when we told him that New York State is first in the Union in the production of many farm crops, that it is the second State in the production of a still longer list, and that in the total value of all farm products raised it ran Iowa in 1921 a close race for third position.

It speaks little for the Eastern farmer's ability to advertise himself and his business that this manufacturer's viewpoint is typical of nearly all city men. For all of them, when they think of farming, think of the great West and have little knowledge of and give little credit to the immense amount of farm business that is carried on within a few hundred miles of the largest Eastern cities.

Much progress has been made in the last few years in bringing to city people a knowledge of the unfortunate economic situation which now exists on farms. It is not so long since farmers were called "baby starvers" and "profiteers." That feeling has largely passed away, and city folks have been brought to understand, at least in part, some of the farmers' financial difficulties. The next step is to educate them to the very great importance of Eastern agriculture; important to them because the products of Eastern farms are so near them, and important to Eastern farmers because such knowledge and better understanding would lead to a better market for Eastern products. Therefore, we are very much in favor of every movement like the proposed Fruit Show to be held in New York City next fall, which has for its object the advertising and the emphasizing of Eastern-grown farm products.

The affection of your dog is unfailing and unobtrusive. If you are sad, so is he. If you are merry, no one is more willing to leap and laugh with you than he. To your dog you are never old. To your dog you are never poor. Whether you live in a palace or a cottage, he does not care, and fall you as low as you may, you are his providence and his idol still.—ANONYMOUS.

"Greatest Good for the Greatest Number"

But the Argument Is Over Which Is the Greatest Good—Be Sure To Vote

ARE farm people for prohibition? I believe that the majority of them are in favor of prohibition. Prohibition is beneficial to the best interests of the farming people, as well as to other kinds of people. Prohibition may have hurt some people in the booze business, but there is no lack of demand for the labor (skilled or unskilled) of the men who formerly were brewing beer or distilling stronger drinks. Prohibition is bringing about the greatest good for the greatest number.

One writer of Bucks Co., Pa., asks, "if alcohol is such a terror to mankind, why has the Creator made it so plentiful?" Well, the Creator also made the deadly cobras plentiful in India and rattlesnakes plentiful in North America, and any sane man will admit they are a dreadful terror to mankind. And yet the said serpents have their uses. The venom of both of these snakes is used for medical purposes. One school of medicine uses rattlesnake venom, highly diluted, for combatting certain cancerous disease conditions.

However, mankind produces vast quantities of alcohol, whereas the Creator may be said to produce only small quantities of alcohol, which, under natural conditions, soon becomes dissipated and quickly returns back to the elements. So man has gone far beyond the Creator in providing an insidious, intoxicating and poisonous drug which is destructive in more ways than one to the life, liberty and general prosperity of mankind.

If the Volstead law is defied and broken by many lovers of booze, it is no good reason for allowing the law to become weak law and a dead letter. There are other laws against various crimes and minor offenses, yet the said laws are often broken by the reckless and desperate. This is no reason for repealing those laws, which are more or less protective to the public.

I am for the Eighteenth Amendment as it now stands. Strict enforcement of all prohibition laws should be carried out.

I am opposed to light wines and beers being put on sale or legalized for public distribution.

Certainly, President Harding has taken the right stand when he comes out solidly in favor of prohibition as specified in the Eighteenth Amendment. The Volstead law is here to stay quite a long term. It all comes out to this showdown: the greatest good for the greatest number of people—children included, of course. The people of our country have enough trouble without creating more artificial trouble by pouring more or less diluted alcohol down their throats. Long live prohibition and the backers of that great good doctrine! C. W. W., New York.

SALOONS THRIVE IN SPITE OF BREAD LINES

IN your issue of June 16th, I note the letter from a so-called farmer who is opposed to prohibition.

I would like to know what kind of a farming community he lives in, if 70% of the farmers are against prohibition. I am

By A. A. READERS

one of your 95% farmers who favors it with all my heart. I have lived in various localities for over seventy years and have had an opportunity to see the effects of the free use of liquor, also to see the effects of prohibition. I know a good many farmers and among them all, I do not know *one* who is opposed to it. The man who wrote the letter must be a bachelor. No man who loves his family could, for a moment, wish to have

Song of the Rye

I WAS made to be eaten,
And not to be drank,
To be threshed in a barn,
Not soaked in a tank,
I come as a blessing
When put through a mill;
As a blight and a curse
When run through a still.
Make me up into loaves,
And your children are fed;
But if into drink,
I'll starve them instead.
In bread I'm a servant,
The eater shall rule;
In drink I am master,
The drinker a fool.
—E. W., N. Y.

free liquor again. New York has made a dark stain on her fair name by revoking the law as she has.

I spent the winter after the war, in England, near London, when there was such a terrible business depression. The only business that flourished was the breweries. One could but notice, as the bread line was

formed each day where thousands and thousands of starving people came for bread, that the saloons did a thriving business. There was liquor enough drunk every day to have more than fed this starving mass of people. I said to myself, "I am glad I am an American and live in a country where prohibition exists." You may set me down as one of your 95% men. C. R. H., Florida.

PROHIBITION FOR ALL, OR NONE

I AM sending you my vote on the prohibition question, and want to give you my opinion of it here.

In the first place, we have no prohibition, and never will have. Prohibition has been the most miserable failure of any law that we have ever had, and the sooner we get it repealed, the better for the American people.

I am a man that has always used beer in a moderate way, and it never did me any harm, and I don't see why I have to give it up, just because some others have used it to excess.

Why don't our honorable lawmakers pass a law to forbid the sale of automobiles? All crooks use them nowadays, and some people are very reckless in driving them. Wouldn't it be just as reasonable to stop the sale of automobiles, because they are used by crooks and reckless drivers, as to stop the sale of liquor, just because a few people use it to excess?

I said in the beginning that we have no prohibition, and I will try to explain what I mean by that statement. I mean that the working class, which produces the living for the Idle Rich, are forbidden from using liquor, while the Idle Rich have their supply in the cellar, and can get more when that is gone. I believe that prohibition was only

passed to keep the working man from having it and was never intended to apply to the men with the "Brass Collars."

Before I came on the farm, one year ago, I was a detective for a well-known detective agency and on one occasion I was detailed to a millionaire's residence on a case of a private nature. I was there for several weeks, and learned that he had a large stock of wine and whisky in his cellar. And, I also learned that he was a strong advocate of prohibition. Still, he had his supply of liquor, but he didn't think that a working man was entitled to his liquor. That is the kind of people that want prohibition; not a man like myself, that likes his glass of beer with a lunch on a hot day.

I also knew a woman in this same city that was a member of the W. C. T. U., and on one occasion, when I was shadowing her in an automobile, she went to get out of her car at home, the chauffeur had to lead her to the house. She was "indisposed" as the Idle Rich call it; but just plain *drunk* as it is called in the working class.

Now! The Prohibition workers state that the majority of the people in the United States want prohibition. Then why don't they let it come to a vote of the people if they are so sure of a victory. I have never had a chance to vote on the proposition myself, and I don't think that any one else has. The

Address.....

Why You Should Vote

Do the American people want prohibition? The Wets emphatically say "No" and the Drys are even more emphatically for it. Both sides claim a majority. Which is right? What do farm people think about it? The opinions of farmers on any problem, if they will express them, go far in determining the outcome of a controversy.

American Agriculturist is taking a vote of farm families on the question of prohibition. It is a vital issue and whether you are for it or against it, be sure to vote in the spaces above. Mail this ballot to the American Agriculturist, 461 Fourth Avenue, New York City.

A Better Self-feed Than Ever—Saves a Man

Throw the bundles from the wagon—one, two, even three at a time. The 1923 Papec will take care of them. *It saves a man* at the feed table, yet handles more corn than ever. The Angle-steel Link Belt gives a positive feed that can be depended on, even with heavy corn.

The 1923 PAPEC Ensilage Cutter

Nowhere else can you find such a wonderful Ensilage Cutter value as in the 1923 Papec. Nowhere else can you get the simple, guaranteed construction that means freedom from repairs, delays and pipe clogging on any silo.

If you need a Cutter, there's nothing to be gained by delay. It will pay you to see your dealer at once and reserve a Papec at present low prices, to fit your tractor or farm engine. Better do it today.

Our 1923 catalog fully explains and illustrates the latest labor-saving Papec. Write for your copy.

Watch the Potato Crop

Estimated Yields in July Are Below Demands

THE potatoes are planted. The acreage has been decided by more than a million growers. We will soon begin to have monthly estimates made by the United States Department of Agriculture as to just what that acreage is. At the same time we will have preliminary estimates as to the probable crop next fall. Just how much do these estimates mean to you as a potato grower and how can you get the most out of these monthly estimates?

By C. E. LADD

on any one other feature. For this reason, the yield per acre is quite variable from year to year.

Suppose that the 1923 crop of potatoes should be estimated on July 1 at 400,000,000 bushels. Will this mean over-production or under-production, and what are the chances that you will receive cost of production next fall? Before we can even make a guess on this question we need to know something about the average crop of potatoes, how many potatoes we normally eat, and what the production has been in some years that we remember.

Where Do Supply and Demand Meet?

Our average annual crop of potatoes in the United States for the past ten years has been about 362,000,000 bushels. The smallest crop during this time was 265,000,000 bushels in 1916, and the largest crop was 451,000,000

New York State ordinarily produces about 100 bushels of potatoes per acre. In 1914, however, the average yield was 145 bushels per acre and the very next year, 1915, gave an average yield of only 62 bushels per acre. We never know when such a variation may again occur.

Our potato crop is produced in so many states with such a widely different range of conditions that we may have a very short crop in one state at the time of an over-production in the United States as a whole. Maine produced only about 60 per cent as many potatoes in 1922 as in 1921. Yet the United States crop in 1922 exceeds 1921 by over 20 per cent.

The Effect of General Price and Business Conditions

The general price level will have a considerable effect on potato prices next fall. Just now the average wholesale price of all commodities in the United States is about 60 per cent above the average before the war. If this general price level should rise rapidly as it did during 1919 it will have a tendency to carry the price

A BASIS FOR JUDGMENT IN REGARD TO THE 1923 POTATO CROP

Save this and fill in the blank spaces as the monthly estimates are issued by the United States Department of Agriculture or by the State Crop Reporting Service.

	1922 All Figures in Millions	1923 Estimates in Millions					
		July	Aug.	Sept.	Oct.	Nov.	Dec.
Total acres in United States...	4.3

bushels in 1922. An over-production depresses the price to such an extent that production is decreased during the succeeding years, though not always on the first year following the over-production.

A very small crop results in a high price, which increases production in succeeding years, though not always in the first year following the under-production. In other words, there is a tendency for the supply to just about equal the demand over a period of ten years or more. The average production over these ten years was about the number of bushels that society was willing and able to buy. It was also the amount that producers were willing and able to produce at the price.

But, we have more people in the United States to-day than we had during the past ten years and this increased population eats more potatoes. Statisticians have computed very carefully just how many potatoes we will need in 1923 to meet the demands of consumers. It is estimated that our country demands about 407,000,000 bushels of potatoes in 1923. More than this amount means over-production and has a tendency to cause lower prices. Less than this means under-production and has a tendency to cause higher prices.

The crop estimates may change greatly during the season, as the total crop depends more upon weather than

of potatoes higher than they would normally go with the same sized crop.

If this general price level should fall as rapidly as it did during 1920, it will have a tendency to carry the price of potatoes lower than they would normally go with the same sized crops.

The United States Bureau of Labor and the United States Department of Agriculture and many of the State Colleges of Agriculture put out publications giving this average wholesale price of all commodities each month.

At the beginning of this article there is an insert giving certain facts about past potato crops. I suggest that each reader who is interested in potato prices, save this insert and fill in the blank spaces the estimated crop as it is issued monthly by the Federal Crop Estimating Service this summer. This will give the most valuable basis for judgment in regard to potato crop conditions that you can obtain.

A very good way to keep in close touch with these conditions is to subscribe to "Weather Crops and Markets" issued by the Bureau of Agricultural Economics, United States Department of Agriculture, Washington, D. C. This will cost you a small subscription price and it is worth the money.

I always liked the American Agriculturist, and it seems to be better than ever.—A. J. Norman, Sinclairville, N. Y.

Farmers and Bankers Meet

Credit Increases Prices—New York Farm News

BANKERS need to know more about farming and farmers need to know more about banking. In recognition of this fact the farmers and bankers of the Second Federal Reserve District got together on July 23 and 24 at the New York State College of Agriculture and freely exchanged opinions, criticisms, and suggestions.

On the first day D. H. Otis, director of the Agricultural Commission of the American Bankers' Association, presided, while G. F. Warren, Leland Spencer, and W. R. Myers, all of the Department of Agricultural Economics of the New York State College of Agriculture, and R. W. Thatcher, director of the State experiment stations, taught the bankers some agriculture.

Then came a tour of the agricultural college, followed by a banquet in the evening at which both bankers and farmers were guests of the Ithaca bankers. W. A. Boyd of the First National bank, Ithaca, presided as toastmaster. M. C. Burritt, director of extension at the State college, gave an account of the work of his institution. H. E. Babcock, chairman of the New York State Cooperative Council, discussed the financing of cooperative associations. Enos Lee, president of the New York State Farm Bureau Federation, and Albert Manning, master of the New York State Grange, made suggestions as to better relations between bankers and farmers. The evening closed with a masterly address by R. H. Treman, director of the Federal Reserve Bank of New York, in which he outlined the organization and operation of this greatest of financial institutions.

On the second day the bankers had their innings. Presiding was W. G. Nash, president of the New York State Bankers' Association and vice-president of the Irving Bank-Columbia Trust of New York. What their institutions are doing in a practical way to meet the credit needs of farmers was told by Henry Burden of the Cazenovia National Bank, Cazenovia; P. H. Salmon of the Second National Bank, Elmira; C. R. Mellen of the Geneva National Bank, Geneva; Donald Newcomb, Hilton State Bank, Hilton; Heber Wheeler, Ontario County Trust Company, Canandaigua; H. B. Ward, Leroy National Bank, Leroy; Marc W. Cole, Farmers' Fund, Inc., Rochester; Otis Thompson, National Bank of Norwich, Norwich; George Wallace, Herkimer National Bank, Herkimer.

Myers Presents Facts

A program so full of good things is difficult to report. Space does not permit even summarizing all the papers which were presented, to say nothing of reporting the extemporaneous speeches. One address, therefore, has been chosen which is representative of the occasion; it is an accurate reflection of present relations between bankers and farmers. W. I. Myers, who gave it, talked from facts drawn from a recent first-hand study of farm credit conditions in Tioga and Genesee Counties, New York. He said that in making the study he started with no intention of criticizing bankers, farmers, or any one else, but of securing a true picture of the situation, a statement of things as they are.

Farmers Must Use Banks More

As a result of what he learned Mr. Myers declared that the most important farm credit problem in New York State is to promote the greater use of banks by farmers. In a measure, he said, this situation is caring for itself, as farmers are each year using banks more and more, especially the more progressive men. "Bank accounts," said Mr. Myers, "should be kept by every farmer; a savings account is, of course, desirable when a man can have one, but a checking account is essential to the businesslike operation of a farm. Bankers do farmers a service as well as themselves when they get them to start checking accounts. Figures show that the balance in checking accounts usually grows; this makes them good business for the banker and means that the farmer is getting ahead.

All present, bankers and farmers alike, were impressed when Mr. Myers stated that the short-time credit to Tioga County farmers came 76 per cent in the form of charge accounts; 16 per cent in notes to others than banks; and but 8 per cent from the banks themselves. "Much of the store credit," Mr. Myers pointed out, "is indirect bank credit, but there is interposed a third party, the dealer, between the farmer and the banker. This makes this type of credit expensive and inefficient and not a good thing for either dealer, farmer, or banker. Part of the high cost of retailing is the credit cost."

Mr. Myers recommended that dealers sell on a closer margin for cash, and that farmers, to get cheaper credit, should borrow direct from the banks. Bankers should sponsor both developments, he declared, because they can prosper only when the community prospers. "A feed dealer's business is to sell feed. The feed store is probably a good place to buy feed, but it is an inefficient place by all measurements to buy credit. One does not go to a hardware store to buy feed, nor should one go to a feed store to get credit."

Summarizing, Mr. Myer said that there should be more personal contacts between bankers and farmers; that country banks should have at least one man thoroughly familiar with farm conditions; that banks should distinguish between individuals and not require endorsers for men whose credit is good and for whom their wives' signature is sufficient. Terms of credit should correspond with the slow turnover of farm business. Farmer representatives on the board of directors might be advisable.

COUNTY NOTES FROM AMONG THE FARMERS

Essex Co.—All crops are looking fairly well except corn, which looks rather sick on account of the late spring cold weather. Hay is good and being put in the barns in good shape. Showers broke the dry spell in the middle of July, which helped pastures greatly. June butterfat, 39c per pound at the Crown Point Creamery; eggs, 35 to 40c; fowls, 25c per pound, live weight.—M. E. B.

Central New York Counties

Wyoming Co.—Dogs are again making trouble for men who keep sheep. In several cases a number of sheep have been killed and others so badly bitten they have died or had to be killed. State troopers are trying to round up the dogs. About 600 people attended the annual G-L-F picnic at Silver Lake on June 29. S. J. Lowell, master of the National Grange, delivered the address of the day.—L. F. F.

Delaware Co.—Hay and oats are looking very poor and lack rain. Potatoes are looking fair. There are very few bugs for this time of the year. Potatoes are very poor on account of no rain to speak of in most parts of the county for three weeks. Milk flows below normal, although up to June 25 it was fair.

Broome Co.—Potatoes are not showing up very well. The weather has been so hot and dry that old meadows and pastures are beginning to show the effects of the drought. Hay is fair. The oats and corn crops are not showing up so well. Milk flow seems low for the flush season.

Tioga Co.—A trip through the Chenango and Chemung Valley shows poor hay, oats and corn crop, but potatoes are not doing so well either. The hot and dry weather is affecting old meadows and pastures. For the flush season the milk flow seems rather short.

Chenango Co.—Hay and oats in this section are looking the best of most of the Central New York districts. Potatoes are fair and quite a large acreage seems to have been planted. Prices on most farm produce are generally good. Rain is needed here for practically everything.

A mark of good service

The familiar mark of the New York Central Lines is to be seen on 264,000 freight cars carrying the products of American industry.

Thousands of new cars, fresh from the builders, go into service each year bearing this mark. In the past three years New York Central orders for new freight cars have totalled \$93,600,000. For new locomotives \$34,000,000 has been expended.

Two years ago, when hundreds of thousands of freight cars on American railroads were standing idle for lack of business, New York Central, with confidence in the future, placed one of the largest orders for cars in railroad history.

When the tide of business turned, and a car surplus was transformed into a car shortage, New York Central had the equipment to move the crops, the coal and the products of industry along its 12,000 miles of lines.

The mark of the New York Central Lines on a new freight car is not only a mark of good transportation service—it is evidence of the fact that back of it is a railroad organization that is building today for the needs of the country tomorrow.

BEFORE YOU BUY A WINDMILL

Carefully consider the following facts:

The Auto-oiled Aermotor is the Genuine Self-oiling Windmill, with every moving part fully and constantly oiled.

The Auto-oiled Aermotor has behind it 8 years of wonderful success. It is not an experiment. The double gears run in oil in a tightly enclosed gear case. They are always flooded with oil and are protected from dust and sleet. Oil an Aermotor once a year and it is always oiled. It never makes a squeak.

You do not have to try an experiment to get a windmill which will run a year with one oiling. The Auto-oiled Aermotor is a tried and perfected machine. Our large factory and our superior equipment enable us to produce economically and accurately. Every purchaser of an Aermotor gets the benefit from quantity production. The Auto-oiled Aermotor is so thoroughly oiled that it runs in the lightest breeze. It gives more service for the money invested than any other piece of machinery on the farm. The Aermotor is made by a responsible company which has been specializing in steel windmills for more than 30 years.

STATE AGE

Among the Farmers

Of New Jersey and Pennsylvania

NEARLY one thousand persons attended the annual summer meeting of the New Jersey State Horticultural Society, held on the Campus of the State Normal School at Glassboro on July 25.

An auto tour starting from the Normal School at 10 o'clock visited numerous orchards and vineyards in the vicinity. The members and guests gathered for lunch in the beautiful grove of oak trees on the Campus of the Normal School, where friendships were renewed, and the Japanese beetle and the drought were informally discussed.

Dr. J. J. Davitz welcomed the guests to the Normal School and told of how they were trying to meet the needs of rural education. The pupils sang and gave a gymnastic demonstration.

The meeting, held in the State Normal School building, was opened with prayer by Rev. A. B. Corlin. Mr. Charles F. Repp, vice-president of the society, welcomed the guests to Glassboro, and spoke of the pioneer work in cold storage development that had been started there. The first commercial cold storage in South Jersey was built by John Repp in Glassboro in 1884, and consisted of a frame building with a capacity of 4,400 baskets with ice stacked around the walls.

Cooley Addresses the Meeting

Mr. L. A. Cooley, secretary of the State Federation of County Boards of Agriculture, stressed the importance of legislation for farmer cooperation. He said the first cooperative marketing association for apples was started in Hammonton in 1867, and lasted twenty years. Since then the movement has grown until the Jersey Fruit Growers' Cooperative Association has come as a result of the efforts of the horticultural society and the State federation.

The veto of the new cooperative bill in New Jersey, which was in line with the Capper-Volstead Bill recently enacted by Congress, should not discourage our farmers, but should impress on them the importance of correcting the unwarranted assumption that the law is aimed to fix high prices or to ignore the law of supply and demand.

Professor M. A. Blake, State horticulturist, said that old varieties of fruit are giving place to new and better sorts. The small, green, early kinds are not as easy to sell now as formerly. Inferior apples likewise demoralize the market price of apples of the better quality. The consumer is looking for fruit of a better quality and the grower must meet this demand with better varieties.

Professor A. J. Farley, State pomologist, who developed the new dry-mixed sulphur lime as a substitute for self-boiled lime sulphur, said that the burning of fruit when dry-mix had been used was caused by sun scald rather than by the ingredients of the spray. In spraying experiments with peaches on Seabrook Farm, dusting had caused the least burning and a commercial sulphur spray the most burning. Dusting gave good control of insects and fungus troubles on peaches and took less labor than spraying.

Dr. T. J. Headlee, entomologist, referring to the Japanese beetle, spoke optimistically of the results obtained in fighting it. Spraying with six pounds of lead arsenate to 100 gallons of water in combination with the dry-mix lime sulphur spray at the time of spraying for the second brood codling moth will repel the beetles on apples.—H. H. ALBERTSON.

NEW JERSEY COUNTY NOTES

Salem Co.—J. L., a farmer of this county, risked the cost of seed last spring and planted a couple of acres of Fordhook limas about a week earlier than usual, the third week in April. He now has the satisfaction of picking beans ahead of the season and getting a nice fat price, about \$5 per bushel. Many farmers, though failing to raise a crop of early potatoes on account of the drought and heat, are planting many late potatoes, consisting of Red Skins, Superb, and Second Cobblers. The

latter crop goes for seed. One of the farmers of this county who was so disappointed with prospects of farming the past few years, especially with reference to the prices of farm products, such as potatoes, sweets and peppers, that he has allowed his nice fields to lie fallow, now works at the carpentering trade. Hay is scarce. The corn crop looks good.—S. B.

Sussex Co.—The drought has had the farmers guessing. It is a problem of what we are going to do. The hay crop is drying up as well as pastures. Corn is feeling the drought. During the middle of the day the leaves of the corn roll up and the crop seems as though it is practically dead. Last May farmers were out buying cows. To-day, owing to the drought, prices have dropped and several farmers are planning to sell their cows. Two large cow sales were held on the first of August. Poultry demonstrations are being held by the county farm bureau in different places of Sussex County. These demonstrations have been very well attended. New potatoes are bringing \$3 a bushel, eggs 30 cents a dozen. The weather is very hot and dry. The thermometer is standing at 90 in the shade.—O. VAN H.

Hunterdon Co.—Oats are being harvested. The crop in general is very poor, very short, and light. Many farmers have cut their oats with a mower and harvested the crop for hay. The hay crop in turn was a decided failure. Farms that in the past have yielded two tons to the acre now yield only a ton on three or four acres. Early potatoes are a failure. The wheat crop is the best in many years, yielding thirty bushels per acre and in some cases more. Corn growth looked good, but the dry weather is beginning to show its effects. Pastures on the upland are all dried up and since farmers have no hay to feed, they are feeding their oats to the cows. Some say that when their oats are gone they will begin to cut corn for the cows. There are many cows for sale but no buyers. There is also little or no sale for horses. One horse dealer who had two carloads shipped in last winter has thirty head now on hand. New wheat is starting at \$1 a bushel. Corn, 85c; oats, 45 to 50c; potatoes, \$2.30 to 2.50 per bushel; butter, 50c; eggs, 28 to 30c. Early apples are very poor and the demand is dull. Winter apples are almost a failure. The drought we are experiencing in this part of New Jersey is the worst since 1876. Thrashers are charging 12c a bushel for wheat and rye. The wheat crop has cost the farmers this year \$1.50 a bushel to raise it.—J. R. F.

CENTRAL PENNSYLVANIA NOTES

J. N. GLOVER

Haying is a job of the past as far as this year is concerned. The quality of the hay this year was excellent, but the yield was comparatively light. New hay sold from \$12 to \$18 a load from the field and was in good demand with very little for sale. Wheat is all cut, stored, and in some cases thrashed. Yields are reported varying from twelve to twenty-five bushels per acre. New wheat is selling at 75 cents. Oats are being cut and will likely be light in weight as the weather has been too mild for the crop to fill well. Early potatoes are ready for digging; however, the crop is pretty light. Farmers still are hoping for rain in order that the late crop will not be a failure.

Manure is being hauled out into the wheat stubble, but it is too dry to do good work ploughing. The stand of grass in wheat fields is poorest in thirty-five years. On account of this many farmers have sown clover in the hope that rain will come to make a stand of hay for next year. We have got to have rain soon if we are to get anything out of the corn crop. The price of beef and hogs, combined with dry weather, has caused several farmers to decide to hold a sale in the spring; but it is a long road that has no turns, and we hope farming may be better next year than this.

Montgomery Ward & Co.

The Oldest Mail Order House is Today the Most Progressive

This new Fall and Winter Catalogue—Is Yours Free

The new, complete Fall and Winter Catalogue is now ready and will be sent you free. You need merely fill in the coupon below.

You may just as well profit by the saving this big book offers you.

In your home, this book will be a price guide and a shopping pleasure. You, too, may as well know the right price to pay, and you may as well save money on nearly everything you buy.

This Book Offers You a Saving of \$50 this Season

Over forty million dollars' worth of goods have been bought at the lowest prices especially for this book—a part of our work to *hold prices down* and to make possible this saving for you.

So if you write for this book, if you use this book, and if your family uses this book, there will be a saving of over \$50 in cash for you this season.

But this book offers you more than a saving—more than low prices. It offers you the satisfaction and the economy of always getting *dependable and serviceable goods*.

Ward Quality and Right Prices

For over fifty years Montgomery Ward & Co. has tried, first of all, to sell only *serviceable* goods that stand inspection and use.

We take great pride in Ward Quality. We always quote the lowest possible price. But we try always to have our *quality a little higher*.

So to write for this book, to use this book every week, not only means a saving in cash, but satisfaction with everything you buy and the saving that long service always brings.

Everything for the Home, the Farm and the Family

FOR WOMEN: This book shows the *best* New York Fashions, selected in New York by our own New York Fashion Experts. And everything is sold without the usual "fashion profits." This book will be a delight, a matter of style news, and a saving to every American woman.

FOR THE HOME: Carpets, furniture, bedding, electrical devices, everything new for home use, everything used in decoration and to make the home modern and complete. And the prices always mean a saving.

FOR THE MEN AND THE FARM:

Everything a man uses or wears, from tools and hardware and famous Riverside Tires, to virgin wool suits—often one-third less than prices you are paying.

The coupon below brings this new, complete Fall and Winter Catalogue to you and your family—entirely free.

You, too, may as well profit by its saving. You need simply fill in this coupon and all the saving and satisfaction and pleasure this book brings will come into your home for you and your family.

Your Order will be Shipped in Less than 48 Hours

Our new perfected system of filling orders is now over a year old.

And our records prove that during the past year nearly all orders were shipped in less than 48 hours.

48 hour service is our promise to you. But we do better than our promise—because a *large percentage of our orders are actually shipped within 24 hours*.

So you can order from Montgomery Ward & Co. and feel sure that nearly every time your order will be shipped in less than 48 hours, and frequently within 24 hours.

How to Lace a Belt

The Service of a Lacing Does Not Depend Solely Upon the Size of the Rawhide

By F. G. BEHREND

No. 1 and the other end of the lacing down through hole No. 14.

From hole No. 1 work to the left and then back, going through the following holes in the order listed: 2-3-4-5-6-7-8-9-10-11-12-13 and stop, coming up through 14.

From hole No. 2 work to the right through the following holes in the order listed: 14-15-16-17-18-19-20-21-22-23-24-25-26, and finish up through hole 27. The finished lace is shown in Fig. 2.

When starting a *single-hinged lace*

One end now finishes, passing down through hole No. 6, and the other end passes up through hole No. 20. The finished lacing is shown in Fig. 3.

Securing the Ends

The ends may be secured in several ways—with some types of lacing the free ends are merely tied together. Another common way is to punch a small hole for the lacing end. The end is passed through this hole and drawn tight, then this end is passed back through this same hole and drawn up tight. The doubled lacing, passing through the hole, jams and is securely held. Any excess lacing is cut off. Ends finished in this manner may be seen in Figs. 2 and 3.

Size of Pulleys

The use of the proper-sized pulleys has much to do with the efficient operation of belt-driven machinery. How to select the proper sizes is not as difficult as some persons think.

In every case, one knows, or can find out, two facts about one of the pulleys—its diameter and its speed. One also knows at least one fact about the other pulley—either how fast it should run or how large it actually is. An example shows how to figure the unknown quantity better than explanation.

Take an engine running at 600 revolutions a minute. The engine pulley is twelve inches in diameter. You desire to run a feed grinder at 900 revolutions a minute. What size pulley should you get? You know the engine pulley's speed is 600 revolutions and its diameter is 12 inches. You know but one thing about the grinder pulley, its speed, which is 900. How can you find the diameter?

Multiply together the two things that you know about one pulley and divide by what you know about the other pulley.

In the above example, 600 multiplied by 12 makes 7,200. Dividing this by 900 gives 8. Therefore, an eight-inch pulley is needed on the feed grinder.

The result will not always come out even, and as pulleys are sold only

in certain sizes it is necessary to select the next larger or smaller pulley. When computing the diameter of a driven pulley, select the next size smaller. When computing the diameter of a driver pulley, select the next size larger.

Cooperatives Must Not Fail

(Continued from page 66)

the same condition; they are all fighting for volume of business, rendering less efficient service because they lack it. And the farms are paying the bill.

Economic necessity demands that farmers go back to fundamentals in the purchase of farm supplies. If they will be guided by the unbiased conclusions drawn from tests at their experiment stations; if they will secure their credit from banks instead of from the local dealers; if they will combine with this efficiency of purchase orderly marketing of farm supplies, then there is great hope for American agriculture and the welfare of the entire country.

MANY make a mistake in thinking that the heavier a lacing is made with rawhide the more durable it will be. This leads them to make the lacing so thick and clumsy that the belt is strained in going around pulleys, causing the lace to wear out in a short time and probably the belt to be torn between the holes. A good lacing is as nearly as possible similar in thickness to the rest of the belt, so that it passes over the pulleys without shock or jar.

Preparing the Belt Ends

For all types of lacings the belt ends should be cut off at right angles, not by guess, but by the aid of a square. For the types of straight lacing this is sufficient, but if a hinged lace is to be put in, then the upper and lower edges of the belt ends should be beveled. This will prevent the sharp edges from cutting the lacings.

Placing the Holes

The arrangement of the holes will depend upon the type of lacing desired, the width of the belt, and also upon the personal preference of the individual doing the work. The various types of lacings may be used on leather, rubber or canvas belts. As a general rule the holes should be placed farther back from the ends on canvas and rubber belts than on leather belts.

Making the Holes

For leather belts the holes are best made with a hollow punch, one having an oval shape preferred, and if used the long diameter of the hole should be parallel to the sides of the belt. The size should be such that the lacing will fill the holes, but will not pull in so tightly as to tear the belt. For canvas belts, or rubber-covered cotton belts, the holes should be made with an awl and not with a hollow punch, as the punch will cut off many strands of the cloth and thus unnecessarily weaken the belt. The tine of an old pitchfork will make a very good awl for this purpose and the oval shape will be found convenient. When using an awl, work it back and forth sideways when passing through the belt, thus making a hole by forcing apart the fibers instead of cutting them.

Types of Rawhide Lacings

The two most important types of lacings are (a) the Double Straight Lace and (b) the Single Hinge Lace.

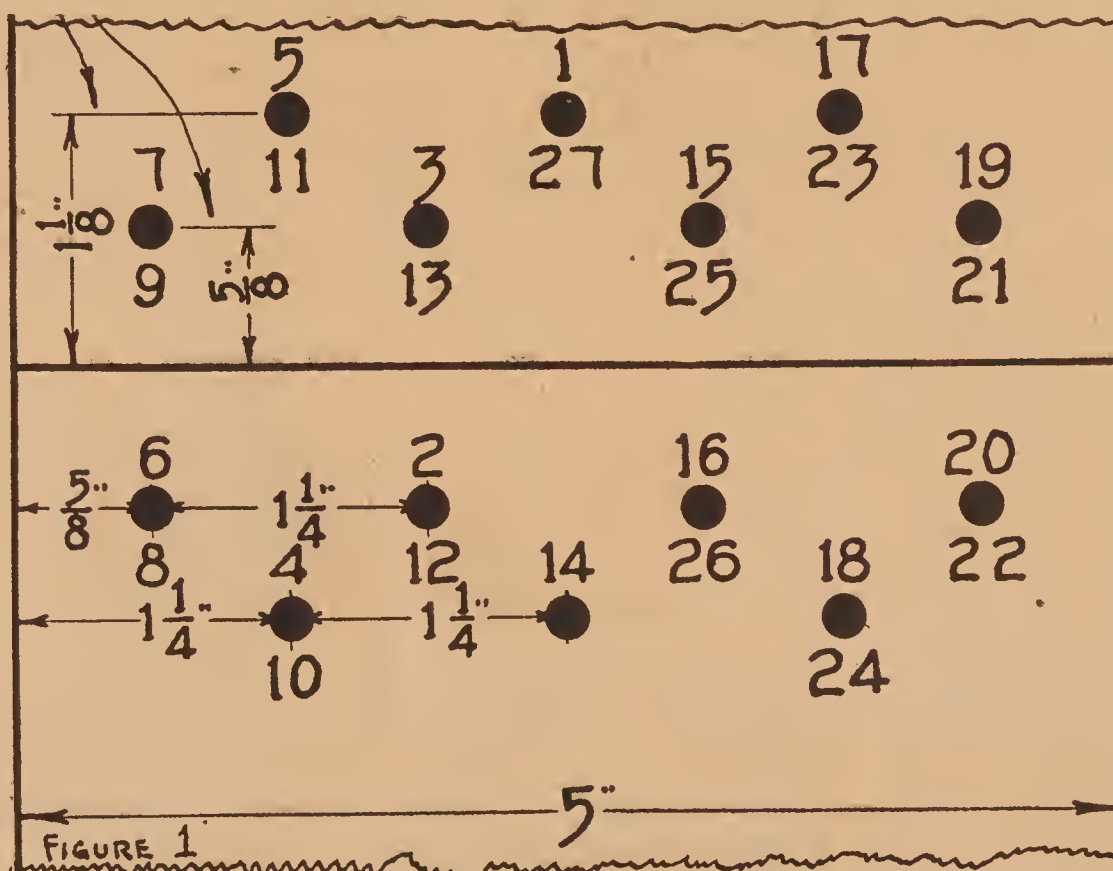

For leather belts the straight lace is generally used unless the belt is to be run over very small pulleys or to be bent backward over idler pulleys, in which cases the hinge lace will last much longer than the straight.

For canvas or rubber belting the hinge lace is best as it is more flexible and therefore less liable to pull out at the holes than is the straight lace.

How to Make the Lacings

With this type all lacings on the pulley side of the belt must run parallel with the sides of the belt. See Fig. 3.

Holding the pulley side of the belt up (refer to the diagram) pass one end of the lacing down through hole

it should be remembered that the lacing is never passed from a hole in one belt end to another hole in the same belt end. Also, when passing from one belt end to the other the lacing is never carried straight across, but is always passed between the belt ends.

Start at the middle and, holding the pulley side of the belt up, proceed as follows:

Pass one end of the lacing down through hole No. 1—pass the other end down between the belt ends and up through hole No. 14.

Work first to the left edge with the lacing end which was passed down through hole No. 1. Pass this lacing end through the following holes in the order listed, remembering to always pass between the belt ends when passing from one belt end to the other, from No. 1-2-3-2-5-4-5-6-7-6.

Now work to the right edge of the belt with the lacing end which passes up through hole No. 14, passing through the following holes in the following order from No. 14 to No. 1, then No. 16-15-16-17-18-17-20-21-20.

Does Contagious Abortion Exist?

W. B. SUTTON

SCIENTISTS have told us that it does; that it is carried from one animal to another in breeding by means of a germ or microbe.

Lately they have concluded that the germ or microbe has nothing to do with the disease.

I have no desire to belittle the work of the scientists, but would call attention to a few things which they seem to have overlooked and which seem to me to indicate the cause of the disease.

Abortion may be caused by anything that will produce a weak or flabby condition of the abdomen.

Intensive milk production is an unnatural condition, which in its very nature will produce such a condition.

The cow under natural conditions gets about three months of lush feed, which makes a large flow of milk; then the grasses begin to ripen and become dry and constipating, with a consequent lessening of the milk flow. The dairyman seeks to avoid this by giving lush or loosening feeds the year round; if the cow will yield milk so long, the muscles become weak and abortion is the likely result.

Another favorite practice of dairy-men is to breed heifers at the age of twelve to fifteen months, before they have attained anything like a full physical development, thus putting upon the immature animal the further burden of reproduction, which has a further tendency toward a weakened condition of the muscles of reproduction. Pregnant animals should have plenty of exercise to assist in strengthening all the body-muscles; they should also have muscle-building feed in abundance.

A lawyer friend of mine bought a farm to show farmers how to make money. He built a large barn with water in each stall and stocked it with cows from the Hood farm, and when cold weather came shut them all up without a breath of pure air from outside and fed them cut feed steamed over night, and they were petted and rubbed and curried to excess. Inside of two months they all sickened and died for lack of proper air, exercise, and possibly, food.

Another friend told me of his experience with chickens. He built a fine hen-parlor, plastering it and making it as air-tight as an expert carpenter could do it.

Cold weather was already on when it was completed and he put in it two hundred fine May-hatched pullets which had already made their winter coats. The place was equipped with a stove and kept as nearly as possible to 70 degrees.

The pullets began to moult and all sickened and died. All this apropos of the fact that you cannot get very far away from Nature.

If one cow became abortive from the result of such conditions as I have mentioned in the beginning of this article, why might not many others do the same if in the same herd and subject to the same conditions? Is it not more reasonable to suppose that it resulted from such conditions than from contagion?

I have never heard of such a disease on the great ranges of the West.

G. L. F. HOW TO BUY FEEDS

The following is quoted from Page 61 of the L. A. Maynard new book "Better Dairy Farming" by Prof. E. S. Savage and Prof. L. A. Maynard.

PROF. E. S. SAVAGE

"THE object in buying feeds is to select those which at the least cost will form a satisfactory ration with the home-grown materials. By a satisfactory ration we mean one that will produce the maximum amount of milk. It must have adequate protein and be highly digestible. It must furnish the proper bulk and variety and be palatable. If we overlook them in trying to get a cheap ration, any money saved may be lost many times in lessened production."

"When a feed is taken into the body, a certain part is digested and absorbed while the remainder is excreted in the manure. Of course, only that part which is digested is of use to the animal; thus, in buying feeds we want to get the maximum amount of digestible material for our money. In fact, the only real way to tell what feeds are cheapest is to compare them on the basis of their digestible material. To do this we compute the total digestible nutrients of each feed."

Save Money on Your Feed Bill!

Feed G. L. F. Rations—High in Digestible Nutrients

The formulas of G. L. F. Rations are public so you can figure the cost of 100 lbs. of digestible nutrients in each ration. You have the choice of Milk Maker, with 1506 lbs. of protol digestible nutrients, a 24% protein ration—Exchange Dairy, with 1452 lbs. of protol digestible nutrients, a 20% protein ration, and G. L. F. Sixteen Percent, with 1476 lbs. of protol digestible nutrients, a 16% protein ration to feed with your roughage.

G. L. F. Rations, manufactured by your own cooperative association, give you the greatest value for your dollar. They have great variety, are very palatable and are high in digestible nutrients. *Feed them and you will get more milk cheaper and have a better cow left.*

LOOK AT THE EXPIRATION DATE ON YOUR ADDRESS LABEL

If your subscription has expired, you can show your appreciation of our courtesy in continuing to send you the American Agriculturist, by favoring us with your renewal at once.

There is no question as to your needing every coming issue of American Agriculturist, because some of the future numbers will contain facts that you would not willingly miss for any amount. The worst kind of economy in the world is to save \$1 by not subscribing for American Agriculturist and thereby losing \$10 or \$100 or even \$1,000 by not having the information that will be given in the next 52 issues of American Agriculturist.

If you were a doctor, you would find the best medical journal indispensable. If you are a real farmer who is out for 100% success and not merely a bare living, you owe it to yourself and family to read every coming issue of the American Agriculturist so that you can keep abreast of the times.

SPECIAL BARGAINS!

Fifty-two issues of American Agriculturist for only \$1 is a bargain, but we offer you even still greater value for your money if you accept one of the following special long-term

- 2 years for American Agriculturist only \$1.50
- 3 years for American Agriculturist only 2.00
- 5 years for American Agriculturist only 3.00

It has probably been merely an oversight if you are in arrears in your subscription. Before you forget it, mail your renewal for one of the above bargains and show your heart is still with us in our fight for your success and happiness.

The Service Bureau

Don't Be Fooled By Cling Cutlery

SCISSORS are useful—but the Cling Cutlery Corporation was better at selling stock than scissors.

After several stock-selling drives, which have resulted in taking \$800,000 from the public and giving nothing in return, the company is now endeavoring to raise more money on a glittering offer of 8 per cent.

The history of how the securities were marketed is a sad commentary on the methods used to unload stock on a trustful public. One "reloading" outfit after another would take the stock at a payment of from \$1.66 to \$12 a share and re-sell it to the public at \$10 to \$50. Meanwhile, more than two years after the stock began to be sold, a small factory was started to produce scissors.

The company now has no factory and its machinery is in storage. During its career, it manufactured approximately 47,000 pairs of scissors and sold 30,430 at a gross loss of \$15,086.14. The Cling Cutlery Corporation with this record, claims as assets, \$317,080.69, for organization, development and experience. Its current assets are but \$23,917.05, and it apparently costs more to sell the scissors than if none were made.

The Better Business Bureau sends a widespread warning of this concern, which now wants \$100,000 from the public. Keep your money—you can use it better than the Cling Cutlery Company.

WE HIT THE DOG DAYS

After exhausting every possible method by which we might induce Mr. Harry Trask of the Edgewood Farm, Plantsville, Conn., to refund \$15 to a subscriber, we made good our guarantee and sent Mr. F. P. of New York a check to cover his loss.

Mr. P. had answered an advertisement of collie pups, inserted some time ago in the American Agriculturist by Mr. Trask, who we believed to be responsible. But he never shipped the dog, nor would he answer repeated letters asking him to return the money.

Our lawyers could get only a promise to pay "some time." Not satisfied with that, we sent our own check to Mr. P. Mr. Trask has never answered any letter but the one our lawyers sent and that not with any satisfactory result. His advertisement has not appeared in the American Agriculturist under its new management nor will it in the future.

A Guarantee Disregarded—and Another One Kept

Another unsatisfactory transaction on which the American Agriculturist made good also, concerned the purchase of a dog. Mrs. I. R. of New York sent \$8 to I. R. Tanger of York Springs, Pa. The dog reached Mrs. R., but was sick when it came and soon died. She notified Mr. Tanger at once of its condition, but he made no reply, although in a previous letter he had guaranteed that the dog, if not satisfactory, would be taken back.

We sent Mrs. R. a check for \$9.32, which included her expenses in the matter.

PROMPT ACTION ON A REFUND

"I think your service is wonderful and will never be able to say enough for you. Your paper is always looked forward to."

Mr. H. B. C. of New York had ordered a sewing machine from a mail-order house and upon returning it, failed to receive a refund. The Service Bureau secured a check for \$39.37, including express charges, within ten days after the matter had been referred to them. Mr. C. renewed his own subscription and sent us a new subscriber.

THE FASHION EDITOR HORNS IN

"I think there must be some magic about your department."

We'd like to claim to have second sight or mystic powers, but we had to assure Mrs. F. S. C., who flattered us thus, that it was just hard work and stick-at-it-iveness.

At any rate, she got a long lost \$5 after letters had mailed nothing. Mrs.

C. bought a purse by mail—she frankly said it was "terrible." Our fashion editor, being hurriedly called into consultation, said even ruder things about it, and offered to take anybody's \$5 and buy a "really decent purse" from any smart New York store.

With this expert testimony to strengthen our case, we went after the firm which sold the article to Mrs. C., and her letter was the result.

She added a subscription renewal and another, to get those 18 rose bushes. (see our circulation department's advertisement.)

A BELATED PAYMENT

"You certainly can make them come across!"

(This seems to be our day for receiving bouquets! Not from the 18 rosebushes, either, but the verbal kind). A check for \$16.96 from a mid-western mail-order house, which made good its guarantee when we took a hand in a four-months old claim, brought this enthusiastic comment from Mr. W. S., of New York.

SPREADING THE GOOD NEWS

"We praise your company very much to our neighbors and friends."

That's the way to talk! We hope the neighbors and friends of Mr. D. W. of N. Y., to whom we recently sent a \$6.10 check in payment of an account he had been trying to settle will refer their troubles to us as he did.

Mr. W's difficulty was with a firm which buys rabbits, and he had not received his money in spite of several letters. When the American Agriculturist took a hand, the check was immediately forthcoming.

SOME LETTERS DON'T WORK

It is bad enough to lose money, but there is something especially exasperating about writing letter after letter without even receiving an answer.

At least so Mrs. M. G. D., of Pa., felt when a hatchery cashed her check for \$14, and then apparently lost all interest in her. She wrote five letters to the firm. Then wrote one to the American Agriculturist.

That was the letter which did the work. A check came to us by return mail; our letter, enclosing the check, went to Mrs. D., and she wrote to say that if she hadn't asked the Service Bureau to intervene, she would probably still be writing the hatchery, with her \$14 as far away as ever.

NEARLY FIVE YEARS OLD

A claim which dated back to 1918 was recently adjusted in favor of a subscriber. His claim was against a Massachusetts drug company; and as soon as the matter was presented to them, the New York representative called to go over the matter with us.

The firm claimed that the subscriber had not sent invoices with his shipments, which made it hard to trace old orders. However, they immediately made out a check for \$24.70 in our subscriber's favor, and promised that future shipments, properly invoiced, would be paid for on a ten day basis.

EXPENSIVE TURKEYS GO ASTRAY

How would you like to receive a check for \$203.36? Mr. E. T. Babcock of New York State shipped some turkeys of that value shortly before Thanksgiving last year. They were lost in transit. Mr. Babcock held them at a higher valuation than the express company was willing to accept and the case dragged along for some time.

Finally the Service Bureau suggested a compromise. Both sides of the argument agreed to accept it. As a result Mr. Babcock got his check. He offered to pay a collection fee, but as usual we refused it, for the Service Bureau is not a business scheme but a department which simply tries to help subscribers out of similar difficulties.

Give a thought to Advertising

BECAUSE people seem to think that an advertising man should know everything, one of his biggest jobs is to ask questions and try to be a walking encyclopedia and dictionary combined.

Recently in answer to a request for information we sent out two thousand post cards to *American Agriculturist* subscribers from which the following is quoted:

Dear Subscriber—

As the owner of a beard, you have, of course, had some experience with shaving soaps.

The manufacturer of a well-known brand of shaving soap has asked us for certain information concerning the shaving habits of farmers. We are going to ask the subscribers of the *American Agriculturist* to help us give this manufacturer the information he wants.

Then we listed these five questions for which we requested answers.

1. What *brand* of shaving soap are you using at the present time?
2. What *form* of shaving soap are you using at the present time? (Please state whether it is stick, cream, powder, cake or mug soap.)
3. What was the *name* of the *last brand* of shaving soap you were using just before you changed to the brand you are now using?
4. What *form* of shaving soap were you using just before you changed to the *brand* you are now using?
5. What caused you to change?

1. Was recommended
2. Saw it advertised
3. Received sample

To make it worth the time, the manufacturer offers a free sample tube of shaving cream good for at least six shaves to anyone who answers and signs his name. Already the replies are pouring in.

How would you answer those questions? Let us know. You see we are like all advertising men—always asking questions—but the more an advertising man knows the more he is able to help, not only his magazine and the advertisers in it, but also its subscribers. So we advertising men don't mind being walking question marks.

Also we're always glad to hear from you about any advertising matter. Any question that is troubling you, anything you would like to know—you'll find the key hanging outside the door—and us on the job with the information.

Weather, Crops and Labor

Condensed Report of Conditions on New York Farms

THE following summary of conditions was obtained from accurate information furnished from every section of New York State. It is a matter of great interest and value to every farmer. In studying the reports, we were especially impressed with what a great farm empire New York State is in itself. For instance, there has been plenty of rain in the big dairy counties of the north, making good pastures, hay and crop conditions, while in the southern and southeastern parts of the State, the reverse was true for the most of July. Farmers living in the north would draw entirely opposite conclusions as to crop prospects as those living in the southern and southeastern parts of the State. It is only by judging the conditions of the whole State and of the Nation itself that one can form an accurate judgment as to the size of crops and the markets at harvest time.

The summarized report follows:

WEATHER CONDITIONS.

1. *Northern New York*: Wet with cool nights.
2. *Western New York*: Fairly dry.
3. *Central New York*: Dry, with cool nights.
4. *Southwestern New York*: Dry, with cool nights.
5. *Southern and Southeastern New York*: Very dry and cool nights.

MILK FLOW AS COMPARED WITH SAME TIME LAST YEAR.

Generally higher in northern New York, averaging about the same in the central and western sections of the State and less in the southern and southeastern sections.

Note how milk flow is influenced by dry weather.

CROPS.

1. *Winter Wheat*: Good in western New York; fair in other sections where the acreage is smaller; wheat harvest is crowding and interfering with haying.
2. *Oats*: Good in northern New York on high ground; good in western and central New York; poor to very poor and short in the southern tier counties and in the eastern and southeastern sections of the State.
3. *Corn*: Late and poor in northern New York; reported good in western New York; fair to poor in most of central New York and fair to good in the southern and southeastern sections.
4. *Alfalfa*: Good to excellent in all sections of the State.
5. *Hay*: Excellent in northern and western New York; good to fair in the central part of the State, and fair to poor in southwestern, southern and southeastern sections.
6. *Late Potatoes*: Quite generally looking well with good prospects in all parts of the State except two or three of the counties in the southeastern section and on Long Island. Long Island prospects are reported poor.
7. *Early Potatoes*: Everywhere badly affected by the dry weather.
8. *Beans*: Reported fair in western New York.
9. *Cabbage*: Western New York reported set too late and a smaller acreage than usual.
10. *Buckwheat*: Northern New York a larger acreage than usual and reported a good start. No report on the remainder of the State.
11. *Pastures*: Excellent to extra good in northern New York; good in western New York; varying from poor to good in central New York, and from poor to very poor in the southern and southeastern sections. Note how the report on the pastures varies as to the amount of rainfall.
12. *Apples*: Generally a light crop in

western New York and fair to poor elsewhere.

13. *Peaches*: Reported generally poor except in the Hudson River Counties.
14. *Pears*: Reported good in western New York; very light elsewhere.
15. *Plums*: Reported a light crop.
16. *Cherries*: Good in Genesee and Ulster Counties; fair to poor elsewhere.

FARM WAGES.

1. Month Man With Board.
 - a. *Northern New York*: Varying from \$35 to \$50.
 - b. *Western New York*: \$60.
 - c. *Central New York*: Varying from \$50 to \$60, with one report in Oneida County of \$87.50; Albany County, \$50; Montgomery County, \$75.
 - d. *Southwestern New York*: \$45.
 - e. *Southeastern New York*: \$45 to \$50.
2. Month Man Without Board But With House Privileges, etc.
 - a. *Northern New York*: \$60.
 - b. *Western New York*: \$75 to \$80.
 - c. *Central New York*: \$50 to \$75.
 - d. *Southeastern New York*: Varying from \$62 to \$72. There was one report from Ulster County of \$90.
3. Wages of Day Man for Harvest.
 - a. *Northern New York*: \$5.50 to \$7.00.
 - b. *Western New York*: \$5.00 to \$5.50.
 - c. *Central New York*: \$2.25 to \$5.50.
 - d. *Southeastern New York*: \$3.25 to \$5.00.

GENERAL REMARKS

Although weather has been excellent for haying, the work is far behind owing to lack of help.

LONG NEWS IN SHORT PARAGRAPHS

The New York State Department of Farms and Markets reports that the disease, rabies, is more prevalent in the State than it has been before in several years. Outbreaks have occurred in Rennselaer, Chenango, and Schoharie Counties. Strict quarantines have been laid in these counties and every precaution taken to prevent the spread of the disease.

The seventh annual meeting of the National Milk Producers' Federation will be held in Pittsburgh, Pa., November 8 and 9. The meeting will go to Pittsburgh on the invitation of the Dairymen's Cooperative Sales Company, a cooperative dairymen's organization in the territory supplying the city of Pittsburgh. Besides the regular business session, arrangements are being made to secure speakers who are internationally known experts on cooperative marketing. An attendance of at least two thousand cooperative members and leaders is expected.

The National Milk Producers' Federation represents twenty-six important cooperative dairy organizations, including a joint membership of about 250,000 milk farmers, selling annually from two hundred and fifty to three hundred million dollars' worth of milk. The officers are: John D. Miller, president; W. F. Schilling, first vice-president; H. W. Ingersoll, second vice-president; F. P. Willits, treasurer, and Charles W. Holman, secretary.

The Brown Mouse — By Herbert Quick

"WHAT time's the election, Ez?" asked Mrs. Bronson at breakfast.

"I'm going at four o'clock," said Ezra. "And I don't want to hear any more from any one"—looking at Newton—"about the election. Its none of the business of the women an' boys."

Newton took this reproof in an unexpectedly submissive spirit. In fact, he exhibited his very best side to the family that morning, like one going on a long journey, or about to be married off, or engaged in some deep dark plot.

"I s'pose you're off trampin' the slews at the sight of a flock of ducks four miles off as usual?" stated Mr. Bronson challengingly.

"I thought," said Newton, "that I'd get a lot of raisin bait ready for the pocket-gophers in the lower meadow. They'll be throwing up their mounds by the first of April."

"Not them," said Mr. Bronson, somewhat mollified, "not before May. Where'd you get the raisin idee?"

"We learned it in school," answered Newton. "Jim had me study a bulletin on the control and eradication of pocket-gophers. You use raisins with strychnine in 'em—and it tells how."

"Some fool notion, I s'pose," said Mr. Bronson, rising. "But go ahead if you're careful about handlin' the strychnine."

Newton spent the time from twelve-thirty to half after two in watching the clock; and twenty minutes to three found him seated in the woodshed with a pen-knife in his hand, a small vial of strychnine crystals on a stand before him, a saucer of raisins at his right hand, and one exactly like it, partially filled with gopher bait—by which is meant raisins under the skin of each of which a minute crystal of strychnine had been inserted on the point of the knife.

At three-thirty, Newton went into the house and lay down on the horse-hair sofa, saying to his mother that he felt kind o' funny and thought he'd lie down a while.

At three-forty he heard his father's voice in the kitchen and knew that his sire was preparing to start for the scene of battle.

A groan issued from Newton's lips—a gruesome groan. But his father's voice from the kitchen door betrayed no agitation.

"What's the matter?"

It was Newton's little sister who asked the question, evincing appreciation of Newton's efforts. Even though regarded as a pure matter of make-believe, such sounds were terrible.

"Oh, sister, sister!" howled Newton, "run and tell 'em that brother's dying!"

Fanny went rather slowly to the kitchen door, and casually remarked that Newton was dying on the sofa in the sitting-room.

"You little fraud!" said her father.

"Why, Fanny!" said her mother—and ran into the sitting-room—whence in a moment, with a cry that was almost a scream, she summoned her husband, who responded at the top of his speed.

NEWTON was groaning and in convulsions. Horrible grimaces contorted his face, his jaws were set, his arms and legs drawn up, and his muscles tense.

"What's the matter?" His father's voice was stern as well as full of anxiety. "What's the matter, boy?"

"Oh!" cried Newton. "Oh! Oh! Oh!"

"Newtie, Newtie!" cried his mother, "where are you in pain? Tell mother, Newtie!"

"Oh," groaned Newtie, relaxing, "I feel awful!"

"What you been eating?" interrogated his father.

"Nothing," replied Newton.

"I saw you eatin' dinner," said his father.

Again Newton was convulsed by strong spasms, and again his groans filled the hearts of his parents with terror.

"That's all I've eaten," said he, when his spasms had passed, "except a few raisins. I was putting strychnine in 'em—"

"Oh, heavens!" cried his mother. "He's poisoned! Drive for the doctor, Ezra! Drive!"

Mr. Bronson forgot all about the election—forgot everything save antidotes and speed. He leaped toward the door. As he passed out, he shouted "Give him an emetic!" He tore the hitching straps from the posts, jumped into the buggy and headed for the road. Skilfully avoiding an overturn as he rounded into the highway, he gave the spirited horses their heads, and fled toward town. Just at the town limits, he met the doctor in Sheriff Dilly's automobile. Mr. Bronson signaled them to stop, ignoring the

fact that they were making similar signs to him.

"We're just starting for your place," said the doctor. "Your wife got me on the phone."

"Thank God!" replied Bronson. "Don't fool any time away on me. Drive!"

"Get in here, Ez," said the sheriff. "Doc knows how to drive, and I'll come on with your team. They need a slow drive to cool 'em off."

"Why didn't you phone me?" asked the doctor.

"Never thought of it," replied Bronson. "I hain't had the phone only a few years. Drive faster!"

"I want to get there, or I would," answered the doctor. "Don't worry. From what your wife told me over the phone I don't believe the boy's eaten any more strychnine than I have—and probably not so much."

"He was alive, then?"

"Alive and making an argument against taking the emetic," replied the doctor. "But I guess she got it down him."

"I'd hate to lose that boy, Doc!"

"I don't believe there's any danger. It doesn't sound like a genuine poisoning case to me."

THUS reassured, Mr. Bronson was calm, even if somewhat tragic in calmness, when he entered the death chamber with the doctor. Newton was sitting up, his eyes wet, and his face pale. His mother had won the argument, and Newton had lost his dinner. Haakon Peterson occupied an armchair.

"What's all this?" asked the doctor.

"How you feeling, Newt? Any pain?"

"I'm all right," said Newton. "Don't give me any more o' that nasty stuff!"

"No," said the doctor, "but if you don't tell me just what you've been eating, and doing, and pulling off on us, I'll use this"—and the doctor exhibited a huge stomach pump.

"What'll you do with that?" asked Newton faintly.

"I'll put this down into your hold, and unload you, that's what I'll do."

"Is the election over, Mr. Peterson?" asked Newton.

"Yes," answered Mr. Peterson, "and the votes counted."

"Who's elected?" asked Newton.

"Colonel Woodruff," answered Mr. Peterson. "The wote was twelve to eleven."

"Well, dad," said Newton, "I s'pose you'll be sore, but the only way I could see to get in half a vote for Colonel Woodruff was to get poisoned and send you after the doctor. If you'd gone, it would 'a' been a tie, anyhow, and probably you'd 'a' persuaded somebody to change to Bonner. That's what's the matter with me. I killed your vote. Now, you can do whatever you like to me—but I'm sorry I scared mother."

Ezra Bronson seized Newton by the throat, but his fingers failed to close. "Don't pinch, dad," said Newton. "I've been using that neck an' it's tired." Mr. Bronson dropped his hands to his sides, glared at his son for a moment and breathed a sigh of relief.

"Why, you darned infernal little fool," said he. "I've a notion to take a hamstring to you! If I'd been there the vote would have been eleven to thirteen!"

"There was plenty votes there for the colonel, if he needed 'em," said Haakon, whose politician's mind was already fully adjusted to the changed conditions. "Ay tank the Woodruff

District will have a junanymous school board from dis time on once more. Colonel Woodruff is yust the man we have needed."

"I'm with you there," said Bronson. "And as for you, young man, if one or both of them horses is hurt by the run I give them, I'll lick you within an inch of your life—Here comes Dilly driving 'em in now—I guess they're all right. I wouldn't want to drive a good team to death for any young hoodlum like him—All right, how much do I owe you. Doc?"

CHAPTER XVI

THE GLORIOUS FOURTH

A GOOD deal of water ran under the Woodruff District bridges in the weeks between the school election and the Fourth of July picnic at Eight-Mile Grove. They were very important weeks to Jim Irwin, though outwardly uneventful.

Spring, for instance, brought a sort of spiritual crisis to Jim; for he had to face the accusing glance of the fields as they were plowed and sown while he lived indoors. It seemed that there must be something almost wicked in his failure to be afield with his team in the early spring mornings.

A moral crisis accompanies the passing of a man from the struggle with the soil to any occupation, the productiveness of which is not quite so clear. It requires a keenly sensitive nature to feel conscious of it, but Jim Irwin possessed such a temperament; and the gawky schoolmaster slept uneasily, and heard the earliest cock-crow as a soldier hears a call to arms to which he has made up his mind he will not respond.

I believe that this deep instinct for labor in and about the soil is a valid one, and that the gathering together of people in cities has been at the cost of an obscure but actual moral shock.

I doubt if the people of the cities can ever be at rest in a future full of moral searchings of conscience until every man has traced definitely the connection of the work he is doing with the maintenance of his country's population. Sometimes those vocations whose connection can not be so traced will be recognized as wicked ones, and people engaged in them will feel as did Jim—until he worked out the facts in the relation of school-teaching to the feeding, clothing and sheltering of the world.

These are some of the waters that ran under the bridges before the Fourth of July picnic. Few surface indications there were of any change in the little community in this annual gathering of friends and neighbors. Wilbur Smythe was in rather finer fettle than usual as he paid his fervid tribute to the starry flag, and to this very place as the most favored spot in the best country of the greatest state in the most powerful, intellectual, freest and most progressive nation in the best possible of worlds. Jim Irwin read the Declaration rather well, Jennie Woodruff thought, as she sat on the platform between Deacon Avery, the oldest settler in the district, and Mrs. Columbus Brown, the sole local representative of the Daughters of the American Revolution. Colonel Woodruff presided in his Grand Army of the Republic uniform.

THE fresh northwest breeze made free with the oaks, elms, hickories and box-elders of Eight-Mile Grove, and the waters of Pickerel Creek glimmered a hundred yards away, beyond the fitting figures of the boys who preferred to shoot off their own fire-crackers and torpedoes and nigger-chasers, rather than to listen to those of Wilbur Smythe. Still farther off could be heard the voice of a lone lemonade vender, guaranteeing "the coldest lemonade ever sold." And under the shadiest trees a few incorrible Marthas were spreading the snowy tablecloths on which would soon be placed the bountiful repasts stored in ponderous wicker baskets and hamper.

They were passing down from the platform after the exercises had terminated in a rousing rendition of *America*, when Jennie Woodruff tapped Jim Ir-

win on the arm. He looked back at her with his slow gentle smile.

"Isn't your mother here, Jim?" she asked. "I've been looking all over the crowd and can't see her."

"She isn't here," answered Jim. "I was in hopes that when she broke loose and went to your Christmas dinner she would stay loose—but she went home and settled back into her rut."

"Too bad," said Jennie. "She'd have had a nice time if she had come."

"Yes," said Jim, "I believe she would."

"I want help," said Jennie. "Our hamper is terribly heavy. Please!"

It was rather obvious to Mrs. Bonner that Jennie was throwing herself at Jim's head; but that was an article of the Bonner family creed since the decision which closed the hearing at the court-house. He carried the hamper, helped Jennie to spread the cloth on the grass, went with her to the well for water and cracked ice wherewith to cool it. In fact, he quite cut Wilbur Smythe out when that gentleman made ponderous efforts to obtain a share of the favor implied in these permissions.

"Sit down, Jim," said Mrs. Woodruff, "you've earned a bite of what we've got."

"I'm sorry," said Jim, "but I've a prior engagement."

"Why, Jim!" protested Jennie. "I've been counting on you. Don't desert me!"

"I'm awfully sorry, said Jim, "but I promised. I'll see you later."

One might have thought, judging by the colonel's quizzical smile, that he was pleased at Jennie's loss of her former swain.

"We'll have to invite Jim longer ahead of time," said he. "He's getting to be in demand."

He seemed to be in demand—a fact that Jennie confirmed by observation as she chatted with Deacon Avery, Mrs. Columbus Brown and her husband, and the Orator of the Day, at the table set apart for the guests and notables. Jim received a dozen invitations as he passed the groups seated

WHAT HAS HAPPENED

NEWTON BRONSON is up to some deviltry.

Not so long ago, before Jim Irwin took charge of the District School, this was not so surprising. But with other pupils, Newton has discovered education to be a fascinating occupation, rather than a bore. His family, indeed, cannot help being friendly to reformer Jim, though Mr. Bronson stands with the school board, who plan to fire Jim as soon as possible.

Newton takes it hard. Colonel Woodruff a friend of Jim's, suddenly agrees to run against Bonner, Jim's worst enemy. All the pupils echo Newton's wish that he could vote and settle what promises to be a close election.

on the grass—one of them from Mrs. Cornelius Bonner, who saw no particular point in advertising disgruntlement. The children ran to him and clung to his hands; young girls gave him sisterly smiles and such trifles as chicken drumsticks, pieces of cake and like tidbits. His passage to the numerous groups at a square table under a big burr-oak was quite an ovation—an ovation of the significance of which he was himself quite unaware. The people were just friendly, that was all—to his mind.

But Jennie—the daughter of a politician and a promising one herself—Jennie sensed the fact that Jim Irwin had won something from the people of the Woodruff District in the way of deference. He had begun to put on something more significant than clothes, something which he had possessed all the time, but which became valid only as it was publicly apprehended. He was clearly the central figure of his group, in which she recognized the

(Continued on page 80)

"Greatest Good for the Greatest Number"

(Continued from page 69)

amendment was simply put through without giving the voters a chance to say if they wanted it or not.

I can buy all the liquor I want now, and you can too, but it is not fit to drink, and it is ruining the health of our people that drink it. One of the W. C. T. U.'s reason for wanting prohibition was that the workingman was spending his money for whisky and neglecting his family. And he is still doing it, and now has to pay more for his whisky, so his family is worse off than before.

And the bootleggers are getting rich while Uncle Sam is losing millions in revenue. No! He is not losing it, but the farmers and workingmen are paying it instead of the liquor consumers. I have been in several large cities since prohibition has been in effect, and I have seen enough to convince me that there is no such thing as prohibition.

There is no doubt in my mind that our honorable lawmakers in Washington are getting their liquor from abroad, and as long as they can get it they will not bother their brains about changing the Eighteenth Amendment; but I want to say to the public at large that I am in favor of repealing the Volstead Act. If it were possible to have prohibition that would prohibit all, I would be in favor of it. But I am not in favor of showing partiality to one class.—H. H. L., Pennsylvania.

OPINION IS CHANGING

IN regard to prohibition, would state it seems to be dying out in this section, and many farmers who were in favor of it two years ago are very much against it now. I find by asking neighbors that at the very least 60 per cent are for a change to the allowing of the sale of light wines and beer, but do not want saloons as it was before. The prohibitionists look to us now a great deal like "dogs in the manger," as they do not want it themselves, but want laws that deny others the right of having it. How anyone can be a strict prohibitionist after reading the daily papers and seeing what the results are of this bootleg poison that is being sold all over is more than we can understand. Our young people think it so smart and strictly modern now to sneak a drink whenever they can, and what is it they get? Poison.

Why not have decent wine and good, well-made beer?—L. W. P., New York.

CIDER, DANDELIONS, ELDER-BERRIES

I AM in favor of light wines and beer because I think it would stop much of the bootlegging if people could get a little beer without having to go in the night to get it, and there would not be so much whisky sold or drunk as there is now. It seems as though there is more drinking in this town or township all over than there used to be when we had just local option and before the Eighteenth Amendment took effect.

The agricultural papers say that farmers are mostly for prohibition, but one-half to three-fourths of them have a barrel of cider in the cellar that will go 15 to 20 per cent alcohol; and town people scour the country for dandelion blossoms and elderberries to make wine. E. C. M., New York.

WHAT LOCAL OPTION DID

HAVE been reading the letters in your valuable paper for and against prohibition, and find the arguments against it rather ridiculous. To be sure, we read in the Bible where Christ turned water into wine at the wedding feast, but I for one am positive it was not of such a nature that the guests were made helpless, or mistook some other man's wife for his own, and she did not know the difference, or went home and beat his wife and children, continued his spree for a week, lost his job, and the town had to take care of his family until his wife was discharged from the hospital and could take in washing to support the family.

I know of a man who had never bought his wife a Christmas gift but once in twenty years, and then he got drunk and lost it before he reached home. After his town went dry, she received the belated gift, and his children—and, of course, he had many—were comfortably clothed, a good home,

and a real Christmas dinner for the first time in their lives.

Did it pay to vote that town dry?

We all can think of ways we could use it. My home-made lotion for chapped hands does not keep well without it. I can get a bit of alcohol with carbolic acid in it. But oh, how it smells. So I've found glycerine, rose-water, and lemon juice does just as well.

And I must confess an alcohol rub gave one a comfy feeling after a bath, but it was not really necessary. Should I be ill enough to go to a hospital, I could have a rub with it at night.

If thousands of little children whose fathers, and mothers too, sometimes, cannot get the wretched stuff, can be put to bed with their little tummies comfortable with a nourishing supper inside, should we mourn an empty alcohol bottle? If they want to search the Scriptures, the American Bible Society has copies always on hand. Read Proverbs xx, 1; Numbers vi, 3. E. A. G. asks if it would not be as nearly right to prohibit some kinds of foods because some make gluttons of themselves, and speaks of the few drunkards we have. He surely never allowed his wife to attend any W. C. T. U. meetings, where she heard statistics on the subject read. If, as he writes, such a large majority of our citizens made outlaws, many thousand made drug fiends, etc. Will we not still have the "Survival of the Fittest," and their children's children be left with a "Goodly Heritage"? Has not a person enslaved to drink and drugs already lost his "Personal Liberty"?—E. K. W., Maryland.

ENFORCE OR REPEAL IT

COMPLYING with your request that all the readers of your paper give their views on the prohibition amendment, I venture just a few thoughts.

Either enforce the Eighteenth Amendment or repeal it. No nation will long continue that does not enforce its laws. The best way to get rid of a bad law is to strictly enforce it. If the people do not want it, it will be repealed.

Alcohol has ruined the peace and happiness of thousands of homes in our land. Alcohol has been responsible for thousands of financial failures in our land. Thousands of women and children in our land have suffered and are suffering to-day for the necessities of life because the money that should clothe and feed them is spent for alcohol. Where alcohol has been the means of preserving one life, it has been the means of destroying a thousand.

Cut it out! Enforce the Eighteenth Amendment.—W. F. E., West Virginia.

NO EFFECT ON GRAIN PRICES

HEREWITH give my reasons for being in favor of prohibition. About the prices of farmers' grains would be better—"I am from Missouri." Grain to-day is bringing just as much as it ever did unless war made the difference. I hear a lot about barley would be worth more. Let me say that I can see no difference in the price of barley now and in days when things were supposed to be wet.

But I can see a difference in some families of my friends. This personal-liberty stuff is all bosh. There has always been lawbreaking and there will always be more or less until the final reckoning. We have a law against murder, gambling, and other things, but read the result in the daily press.

As long as prohibition of intoxicating liquor is a law of the land, let every true American stand by law and see that it is enforced, whether prohibition, murder, slavery, gambling, reckless driving of automobiles, of which much is traceable to the use of liquor. I might say that it makes no difference to me whether it is wet or dry, and it doesn't, but I am seeking the welfare of generations yet unborn who may rise and call us blessed.—W. W. H., New York.

P. S.—I notice one writer says: "If alcohol is such a terror to mankind, why has the Creator made it so plentiful?" How's this? If Paris green, arsenate of lead, and nicotine sulphate is good for mankind, and an all-wise Creator has supplied the materials so plentifully of which they are made, why not all take just a little for our stomach's sake?

Mighty Lak'a Mule

Hints for the Housewife in the Busy Season

Elizabeth Owen Tells How to Simplify the Work—Midsummer Recipes and Patterns

IN some communities, the housewife must prepare two meals each day in the busy seasons, for the extra help on the farm. This means long hours of hard work over a hot stove. A fireless cooker is the best servant a woman can have at such a time, but if that is out of the question, there are still many ways in which she can lighten her labor.

Beginning a week beforehand let us do a little unusual shopping. First, we'll buy two slabs of soapstone, which are invaluable as fuel and space savers. Pieces six by eight inches and about an inch and a half thick can be purchased for a few cents. They heat through in a few moments and then can be placed on the shelf, or back of range, leaving the range free for other things. Anything placed on them will boil steadily for some time, and for simmering things they are beyond compare.

Rid the House of Flies

Flies will get into the house in spite of screen doors, and there's only one thing more discouraging than trying to eat with flies in the dining-room, and that is to cook with flies in the kitchen. So next we will buy ten cents' worth of oil of lavender, two pounds of rosin, and a pint of castor oil. Heat together until the mixture looks like molasses, smear while hot with paint brush on any kind of paper, and place several sheets about the room.

Having rid the house of flies, use a small paint brush dipped in the oil of lavender on the outside of the screens. We may even sprinkle a few drops in each room; the odor is fresh and sweet.

Next on the list are paper napkins and towels, which save many a rub next wash day; also cup towels, and kitchen hand towels.

Have you a leaky milkpan or dishpan? Then we'll make it leak worse. Make a sort of overgrown colander out of it, then take four large spoons and nail them on for legs. In the center nail an old can for the silverware, when washing dishes place in a larger pan, fill with those troublesome dishes, then scald, and if you must dry them, use a paper towel. Dish washing thus loses many of its terrors.

To Prepare a Fat Hen

If you haven't any roaster, we will get an oblong self-basting one, and if you are short of canned meats or sausage smother a fat hen, (by the way, soda is fine for cleaning chickens; it takes out the pinfeathers). Cut up the fowl, salt, take half flour and half cornmeal, dredge each piece, put two tablespoonfuls of shortening in your roaster, have it hot, put in the chicken, then pepper, put in four slices of sugar-cured breakfast bacon, and enough water to come around the edge of the chicken (don't entirely cover with water), put on lid and set in the oven. If you want to roast sweet potatoes in the roaster, peel, cut into pieces, put in a little butter, lay in potatoes, sprinkle with sugar and salt. Put in one-third cup of water, put on lid and set in the oven. When almost done, take off lid, set in upper oven a few minutes to brown a little.

A Useful Home-Made Casserole

Have you a casserole? If not, get a one or two gallon crock with lid, temper by first soaking in cold water for twenty-four hours, then place it in the oven and let the water come slowly to a boil. To cook roasts or chicken, place in the bottom a rack made of bucket lid or tin pan, punched full of nail holes. Place the meat on this with a little water underneath. In cooking pot roasts, put your roast in a spider on top of the stove and brown on all sides, to prevent loss of flavor. The toughest cuts of meat are made tender and palatable in the casserole.

I suppose you will cook a ham for a change, and while you are about it, you should save some of the stock for seasoning-baked or green beans. Both are permissible on such a table. It would save time and labor if you baked your beans the day beforehand. You can seal part of them in glass

jars and if set in a cool place they will keep perfectly.

New beans, peas or spinach should be put on to cook in hot water, just enough to cover them. Cold water extracts the flavor during its heating. Never use the lid while cooking them if you want them to preserve their color.

Your cakes can be baked the day before. Just try this icing and see if your family even suggests that you cook icing again: Heat three tablespoonfuls of orange juice and one tablespoonful of butter, one teaspoonful of lemon, add the grated rind of

cover with 2 cups sugar. Dot with butter. Cover and set in oven while preparing the following batter: One egg, $\frac{1}{2}$ cup sugar, $\frac{1}{2}$ cup milk, 2 tablespoonfuls butter or other shortening, $1\frac{1}{2}$ cups flour, $2\frac{1}{2}$ teaspoonfuls baking powder. Remove fruit from oven, spread this batter over the top and bake until a rich brown.

Loganberry Sherbert

One quart loganberries, 4 cups sugar, 1 pint water, 2 tablespoonfuls gelatine and the fruit, which has been pressed through a sieve to remove

eggs, sweetened, and slightly brown in the oven.

Loganberry Sauce for Cottage and Bread Pudding

Rub together 2 tablespoonfuls of butter and the same of flour, add $\frac{1}{2}$ cup or more of sugar, and when blended add 1 cup loganberries mashed, to which some sugar has been added, and work in smoothly. Then place on stove or in a double boiler, and add boiling water, boiling until smooth and of the desired thickness.

Loganberry Cake Filling

Beat $\frac{1}{2}$ cup butter and 1 cup sugar to a cream. Add the white of 1 egg beaten stiff and 1 cup crushed loganberries.—H. A. LYMAN.

SOUTHERN SUMMER SOUP

One marrow soup bone; salt, pepper, and dried celery leaves for seasoning; 2 quarts of water; several very ripe tomatoes; 1 cup diced okra; 1 large onion chopped fine; 2 potatoes; 2 carrots; a few butterbeans; 1 tablespoon of rice or barley for thickening.

Put the bone and other ingredients on in cold water in order to extract the juices of the meat, and simmer slowly for an hour or more. The potatoes and thickening may be added after the soup has cooked for some time and danger of sticking is avoided.—HAZEL H. HARRIS.

The Brown Mouse

Bronsons, those queer children from Tennessee, the Simmses, the Talcotts, the Hansens, the Hamms and Colonel Woodruff's hired man, Pete.

Jim sat down between Bettina Hansen, a flaxen-haired young Brunhilde of seventeen, and Calista Simms—Jennie saw him do it, while listening to Wilbur Smythe's account of the exacting nature of the big law practice he was building up.

The repast drew to a close; and over by the burr-oak the crowd had grown to a circle surrounding Jim Irwin.

"He seems to be making an address," said Wilbur Smythe.

"Well, Wilbur," replied the colonel, "you had the first shot at us. Suppose we move over and see what's under discussion."

As they approached the group, they heard Jim Irwin answering something which Ezra Bronson had said.

"You think so, Ezra," said he, "and it seems reasonable that big creameries like those at Omaha, Sioux City, Des Moines and the other centralizer points can make butter cheaper than we would do here—but we've the figures that show that they aren't economical."

"They can't make good butter, for one thing," said Newton Bronson cockily.

"Why can't they?" asked Olaf Hansen, the father of Bettina.

"Well," said Newton, "they have to have so much cream that they've got to ship it so far that it gets rotten on the way, and they have to renovate it with lime and other ingredients before they can churn it."

"Well," said Raymond Simms, "I reckon they sell their butter for all it's worth; an' they can't get within four fo' it as the farmers' creameries in Wisconsin and Minnesota get for theirs."

"How do you kids know so darned much about it?" queried Pete.

"Huh!" sniffed Bettina. "We've been reading and writing letters about it, and figuring percentages on it all winter. We've done arithmetic and geography and grammar and I don't know what else on it."

"Well, I'm agin' any schoolin'," said Pete, "that makes kids smarter than their parents and their parents' hired men. Gi' me another swig o' that lemonade, Jim!"

(Continued next week)

Dip a new broom in hot water before using it the first time to toughen the splints. This makes it flexible and prevents breaking.

EVERYDAY STYLES FOR EVERYDAY PEOPLE

GLANCE at the diagram shows that No. 1821, a dress for the teen-age girl, is cut all in one piece. It is slashed at the low waistline and gathered to give becoming fullness to the growing figure.

No. 1821 cuts in sizes 4, 6, 8, 10, 12 and 14 years. Size 8 requires $1\frac{1}{2}$ yards of 36- or 42-inch material with $3\frac{1}{2}$ yards ribbon. Price 12c.

ARE you a bit stout? Then No. 1662, with the lengthened back and the allowance for fullness over the bust, will appeal to you. The reverses and skirt panels are also good features.

No. 1662 cuts in sizes 36, 38, 40, 42, 44, 46 and 48 inches bust measure. Size 36 takes $4\frac{3}{4}$ yards 44-inch material, $\frac{1}{2}$ yard contrasting and 7 yards binding. Price 12c.

To Order: See that your name, address, pattern numbers and sizes are clearly written and enclose proper remittance (in stamps, preferably) and send to Pattern Department of American Agriculturist, 461 Fourth Avenue, New York City.

Add 10c if you want our summer catalogue.

the orange and enough confectioner's sugar for a thick icing.

Now, if you make up a quart of your favorite salad dressing, another of pudding sauce, and a jar of new beet pickles, you will find your "battle half won."

THE LOGANBERRY BACK IN STYLE

WE have learned to use both the "old-fashioned," popular fruits and others which used to go to waste. The strawberries and raspberries and other midsummer berries are always used on the table and put up in large quantities, but recently we have come to appreciate the loganberry as giving both variety and flavor to the menu.

It may be used as a filling for pie and also put up as a preserve. Loganberry jelly is also delicious and the berries may be used in equal quantities with strawberries for a combination jam that has quite an unusual flavor. Loganberries also give both taste and color to plain junket, tinting to a delicate pink, which makes a very attractive dish with fresh stewed loganberries and whipped cream.

Some unusual recipes for the loganberries are as follows:

Loganberry Batter Pudding

Fill a small granite pudding dish about half full of fresh loganberries,

A DISTINCTIVE model for a gingham is No. 1826 and the interesting thing about this pattern is that the bias bands, the main style feature, may be left off if you prefer and the dress would still be smart.

No. 1826 cuts in 16 years, 36, 38, 40, 42 and 44 inches bust measure. For size 36 use $3\frac{3}{8}$ yards 36-inch material. Pattern 12c.

A LITTLE set of underclothes that are easy to make is No. 8905, which includes a simple Gertrude petticoat, hanging from the shoulders, and a pair of drawers. For all ages from babyhood up.

No. 8905 cuts in sizes $\frac{1}{2}$, 1, 2, 4, 6, 8, 10 and 12 years. Size 4 requires $1\frac{1}{2}$ yards 36-inch material, with 2 yards of 4-inch flouncing and 2 yards of edging. Pattern 12c.

seeds. Lastly, add beaten whites of 2 eggs and freeze.

Loganberry Tapioca

Soak 1 cup pearl tapioca in lukewarm water over night. In the morning put this in a deep $2\frac{1}{2}$ or 3 quart pudding dish (granite or enamel), add a pint of fresh loganberries, with 2 cups sugar. Fill the pan nearly full of warm water, add a tablespoonful of butter, and bake until the tapioca is clear. It will be well to stir it from the bottom once or twice and it may be necessary to add a little hot water if the oven is very hot. Serve with milk or cream.

Loganberry Ice Cream

Scald 2 quarts of milk in double boiler, then dissolve 2 cups of sugar in it. Let cool, add 1 pint of whipped cream, and when partly frozen, add 1 pint of fresh loganberries, crushed and sweetened. Serve with chopped nut meats.

Loganberry Dessert

Make a custard of 1 quart of milk, 1 cup of sugar, and yolks of 4 eggs; flavor with vanilla. Spread bottom of pudding dish with slices of stale, plain cake. Cover with custard, then a layer of loganberries, sprinkled with sugar until the dish is full. Cover that with meringue made with the whites of 2

Soap Bubble Stunts For Parties

Jennie Stewart Tells How the Children May Be Amused

STUNTS with soap bubbles are good for a summer party when it is too hot to play anything very strenuous. With a good suds and some lemonade straws you can perform stunts that will astonish even the grown-ups and before you know it they will all be trying their luck with you.

For the best results you should make up a good suds the day before or at least in the morning and set it in a cold place till afternoon. Add a few drops of glycerine and beat it in well before using, as this makes the bubbles more brilliant and more lasting. Color different glasses of suds with water colors or egg dyes.

One good stunt is to dip the tips of the fingers one after the other in suds, then dip the straw and touch it lightly to the finger tip and blow. You can have a pretty glove on each finger tip.

You can dip flowers into the suds, then dip the straws and touch the edge of a flower and blow. The result is a bright ball covering the flower through which it shows up prettily. White flowers should be blown over with colored suds, colored flowers with clear suds. A little prize might be offered for the biggest and prettiest effect.

Provide Plenty of Straws for Everybody

Bowls, glasses and vases may be used for this next stunt. Wet the edge of the glass with suds, dip the straw and touch to the edge of the glass and blow. A bubble can be obtained that completely covers the top of the glass. Dip the straw again, very carefully push it into the bubble and blow. You may get one large or several small bubbles floating around inside the glass. Colored balls should be blown inside clear ones for this stunt. A prize for the largest and prettiest effect might be offered.

Blowing chains of bubbles is another good stunt. Blow one and just before it drops blow another, then another, each one trying to see who can get the longest chain. You might also have a try to see who can blow the biggest single bubble, the one that lasts longest or that goes the highest in the air.

A very pretty stunt is to touch flowers or leaves on a shrub out in the yard with suds put on with a brush, then blow bubbles of different colors all over the bush. I once saw a few yards of hedge fairly abloom with bubbles put there by a party of boys.

You can blow bubbles on the tips of each other's ear lobes like huge pendulous ear ornaments. One boy blew a huge ball on the top of another boy's head. He walked about for quite a long time before the bubble burst.

WINTER-BLOOMING GERANIUMS

I have always had good success with geraniums and have seen some very fine specimens grown in other windows. I have grown nice small plants from cuttings rooted in mid-summer or even in August, and have taken up large plants that were bedded out and by cutting them back severely have had them blooming freely long before spring. Blooms for Christmas have not been uncommon.

To get good results, the old plants should be cut back a month before they are to be potted up so new growths may break and be ready to grow promptly. The roots should be reduced somewhat with the top as this will make a finer root system. Run a sharp knife straight down all around the plant two or three inches out, first cutting a quarter of the way round on two sides, and a week or ten days later cutting the space between.

September is the best month for lifting and if potted in a six or seven-inch pot for large plants, and smaller for small to medium plants they will fill up with roots in a short time. Be careful in handling, as the fresh new roots formed from the cutting will be easily injured. Have the soil wet when you lift them. Pot firmly and water from the bottom, and do not water again until they show they need it, for too much watering is bad for geraniums. Do not feed until the pots are

full of roots as it retards root action. Sandy soil well filled with black melon woods mould, but not too loose, will make good bloomers.

Small plants from rooted cuttings should be grown on as fast as possible until they are in four-inch pots and if they have made extra strong growth they may need five-inch, but they should then be made to fill the pot with roots as no geranium will bloom well in winter if not root bound.—**RACHAEL RAE.**

OLD KITCHENS MADE NEW

If those of us who seem doomed to live in unhandy old-fashioned farm-houses would do a little planning, we might improve our homes considerably and with little expense.

Wall board, or beaver board, is a great first aid in remodeling old houses. It is inexpensive and easily put up.

I had always had a longing in my heart for a small kitchen, a dining room just big enough, and a large living room. As newly-weds, the first house we moved into consisted of two large rooms, 16x18 feet, separated by a small hall. Three small bedrooms opened off the large rooms. But where were my "just right" kitchen and dining room to come in?

But the wife was not going to be cheated in that way. She made a trip to the nearest town where wall board could be bought. She told the dealer all her plans and got his prices. But the hardest job was waiting her at home, convincing the other half of the firm. At last he consented and the dealer was called on the phone and told to send the material up. The next day the wall board and necessary lumber arrived at the home freight station. Friend husband hauled it home as his part of the contract. A neighboring carpenter was prevailed upon and came in two evenings after supper and in less than a week we had a handy kitchen 16x7 feet, where I could work undisturbed, and a cozy dining room 16x10½ feet. I had my heart's desire, and the cost was less than \$25.—**MRS. NELLIE ANDERSON**

DUST-GATHERERS TO THE DUST PILE

Getting rid of rubbish and useless articles do much to improve a house, is the cheering thought of Cornell domestic scientists, who say that such a cleanup does not require the money needed to make alterations or to buy new articles.

A day spent going through the house discarding knick-knacks and dust collectors, may make all the difference between an ordinary house and an exceptionally attractive one. Looking at it from the practical side, everything discarded means one less thing to take care of.

On this elimination tour, articles of furniture may be found which have been laid aside because of some minor injury. Simple repairs and perhaps a few coats of paint may bring them back to a life of usefulness. Many women enjoy doing this themselves, or the man of the house may lend a hand.

A demonstration of refinishing furniture may be had through the local home demonstration agent, according to a statement from Ithaca.

HOW ABOUT A REST ROOM?

When the farm woman comes to town, is there a place where she has a right to go for a rest and refreshment? Communities are beginning to realize the need and rest rooms are being established.

Often they are started by farm women's organizations, co-operating with town women's clubs, chambers of commerce, or county agents. The first step is to secure a room, near the shopping district, railroad station, or parking centre if possible. In some communities the women have secured a room, rent free, in the courthouse, or town hall. Private merchants will often be glad to give the use of rooms, since it will attract people to their stores.

The furnishings of the room should be simple, comfortable, and durable. A well-equipped room contains rocking chairs, straight chairs, a table with reading material, oilcloth covered lunch tables, a couch, a crib and a screen. A gas burner might be provided for heating water and milk. Pure drinking water and sanitary toilet facilities are necessary for every rest room.

Financing the Rest Room

There are two expenses to be considered—the initial cost of furnishing and the annual cost of maintenance. At first the expense may be borne by the organization starting the room. When its great service has been experienced, often town or county funds provide for its maintenance. In one place, pledge cards were issued to the townspeople calling for five cents a month. It is possible to raise money by the usual manner of fairs and entertainments. However, these make it seem more like a charitable undertaking, and it is better for it to be considered a necessity supported by all.

A matron, though not necessary, adds much to the rest-room's service. She sees that the room is kept clean, she may care for a sleeping child and watch over packages. If a woman should feel ill, it would be a great help to have some one to call on. She may take charge of towels, soap, and clean pillow covers for the couch. In some towns the matron manages the Woman's Exchange, the profit paying for the cost of the rest room.

Before heating milk in a saucepan, rinse the pan in cold water, and it will not scorch so easily.

Reviewing the Latest Eastern Markets and Prices

SUMMER APPLES PLENTIFUL AT NEW YORK

HERSCHEL H. JONES

SUPPLIES of summer apples in the New York wholesale market are already becoming fairly heavy in spite of the short crop reported in most Eastern States. New Jersey has a large crop and most of the New York receipts are from New Jersey, Maryland and Delaware.

William's Red, Dutchess, Yellow Transparents, Starrs and Astrachans are coming from all three of these States. Some Wealthys in from Delaware and Maryland. New York State sections have not begun to ship yet. Virginia is sending some mixed varieties and Transparents.

Such a large proportion of the early apples are small, due to drought, that there is a wide range in prices from the fancy large apples to the poor and ordinary. The market is really oversupplied with poor stuff that is hardly worth shipping. For the best interests of everybody, much of this stuff should have been fed to pigs, or left in the orchard.

No products of farm are more unwisely marketed on the whole than these early apples. If you were to walk through the wholesale market most any night at this time of year, you could count on the fingers of one hand, the shipments of apples that show any evidence of modern grading and packing. Conspicuous among these few would be the shipments of the New Jersey Fruit Growers' Cooperative Association, which packs and markets for its members early apples and peaches under the "Jersey Jerry" brand. They are putting out in round bottom bushel baskets a standardized pack of uniform size and quality, that has been averaging about 25 to 50c more per basket than other ungraded apples of the same quality.

While the market is really good now only for large size fancy apples, a better demand is expected as soon as berries are out of the way. Berries have been so high that pie bakers may be forced to turn to apples. Here is hoping they use apples that are not as sour as some the writer recently attempted to eat in a pie.

The following wholesale prices represent sales of early apples from New Jersey, July 26, per bushel basket: transparent, 50c@\$.1.75; Starrs, \$1@.3; William's Red, \$1.25@\$.2.50; Dutchess, \$1@.1.25; Mixed varieties, 50c@\$.2.

L. I. POTATOES MORE PLENTIFUL

Long Island potatoes were more plentiful in the market last week and the quality showed improvement. The market for them was good. Cobblers from east end of the island brought \$5 @ 5.25 per bbl., while those sold in farmers' public markets from nearby brought \$4.50 @ 5. New Jersey Cobblers are not coming in very heavy in the wholesale market. They are of irregular size and quality, selling at \$3 @ 4 per 150-lb. bag. Up to July 21 New Jersey has shipped only 37 cars as compared with 686 to July 22 last year.

CANADIAN BERRIES ARRIVE

Strawberries and cherries from Canada appeared in the New York market last week. The strawberries sold at from 3c to 25c per quart, depending on quality. The cherries, Montmorencys, were of small size and sold at 40 @ 60c per 6-qt. basket.

Supplies of RASPBERRIES, BLACKBERRIES and BLACK CAPS from New Jersey and Hudson River Valley sections are diminishing rapidly. CURRANTS and GOOSEBERRIES are nearing the close of their season. CHERRIES were in light supply except on Tuesday of last week. The quality from the Hudson Valley and Western New York sections was irregular and demand moderately active for fancy large fruit, with a slightly stronger market after the middle of the week.

The following quotations represent wholesale sales of small fruits on July 26: BLACKBERRIES, per qt., best, 25 @ 27c; fancy, large, 28 @ 32c; small, ordinary, 22 @ 23c. BLACK CAPS, per pt., best, 12 @ 13c; fancy,

large, 14 @ 15c; ordinary, 9 @ 11c. CHERRIES, Hudson River, per 4-qt. basket, black and red sweet, \$1 @ 1.35; red sour, best, 75c; black sour, best, 85 @ 90c; Western New York, red and black sweets, \$1 @ 1.25; red sour, 60 @ 65c. CURRANTS, per qt., red, best, 10 @ 11c; small, ordinary, 8 @ 9c; black, best, 25c. GOOSEBERRIES, per 4-qt. basket, best, 75 @ 85c; fancy, 90c @ \$1; medium, 65 @ 70c per qt.; best, 17 @ 18c. RASPBERRIES, per pt., red, best, 20 @ 22c; fancy, 23 @ 25c; poor to ordinary, 12½ @ 15c.

VEGETABLES TREND UPWARD

Prices on GREEN PEAS advanced during the last week and the quality was somewhat better. On July 27

creamery extra advanced 2¼c per lb. over the previous week, then dropped back to 41@41½c per lb. Thursday, July 26. Reports as to reduced production because of drought had much to do with the advance. A material improvement in the European financial situation would have a marked effect on the butter market, as the prospect of importations is the only check on the buyer's fear of a shortage. The quality of current receipts has been poor, and firms that had contracts to fill for creamery extras began buying against these contracts last week. The demand is very strong for creamery extras that have been officially inspected. In the middle west there has been an increase in the demand for sweet cream and for

other words, some of the best storage eggs took the place of fresh, thereby forcing the fresh into storage, at low prices, of course. The total amount that went into storage exceeded that which came out. The Federal report for July 26 shows over 5,000 more cases on hand in storage on that date than on the same day last year. If production conditions have not materially changed, the market might be expected to follow about the same trend as last year, but it must be remembered that competition of eggs was stimulated last year by a publicity campaign.

Medium qualities of nearby whites, lacking light yolks and showing shrinkage or weak body, moved slowly at irregular prices, ranging from 30 @ 37c, with the top figure only for the better qualities.

Egg shippers are having much difficulty in securing good second hand egg cases. Most of the firms that make a business of collecting and selling used cases, have orders for all their supply for four to six weeks ahead. It is practically impossible to obtain prompt shipment of cases. Shippers are advised to begin scouting for what cases they need at least six weeks in advance, and to secure a reserve of new cases to tide them over any shortage. A list of addresses of dealers and manufacturers of egg packages will be supplied on application to the Market Department of the American Agriculturist.

LARGE BROILERS IN DEMAND

Too many small Leghorn broilers are coming to market before they have reached a weight to get best prices. Broilers should weigh over 1½ lbs for New York market, not average that, but be that heavy as a minimum. Receipts of express broilers were liberal last week, but well-grown stock was in demand. Colored fowls sold well, chiefly at 27c per lb. White Leghorn fowls were mostly poor, selling at 20 @ 25c. Broilers sold July 26 as follows: Colored, 36 @ 37c; Leghorn, large, 33c; Leghorn, average, 30 @ 32c; small mixed and Leghorn, 23 @ 29c.

MAPLE SYRUP DULL

There is very little demand at present for maple syrup or sugar. Several commission houses in New York have shipments on hand, which have an outlet at this season only through bottling concerns. A better market is expected in the fall. The wholesale prices quoted on commission sales at New York are \$1.75 @ 1.90 per gal. for syrup and 20 @ 25c per lb. for sugar in 1-lb. cakes.

Buffalo wholesale market quotations: Syrup, \$1.50 @ 1.75 gal.; Sugar, light, 16@18c, dark, 10@13c lb.

From a Man Who "Tunes In"

"IN regard to your market service by radio, I would say that it is the best money-maker for the farmers that there ever was. It is as quick as lightning, and the farmer doesn't have to ship at the wrong time. If the radio service was stopped the rural people would lose something great.—So don't stop it. I have a receiving set and I am making arrangements with our local telephone system to transmit the market reports over the wire as they come in. I have the only one in this community. A few of your blanks would be very useful then. I don't have any suggestions, only that you keep it up."—J. F. O'Harah, Reynoldsville, Jefferson County, Pa.

These market reports are broadcast every Tuesday, Wednesday, Thursday and Friday at 9:50 Standard time, from Station WEAJ, 492 meters.

State GREEN PEAS sold at \$2.50 @ 3.25 per bushel basket. Small shipments of CAULIFLOWER were received last week from the Hudson River Valley, and found a steady market for the fancy large stock, with a wide range in prices of \$1.50 @ 7.00 per crate, depending on quality. FIRST TOMATOES from the Hudson River Valley section arrived last week and sold at \$1.50 @ 1.75 per 12-qt. basket. GREEN BEANS were in light supply from up-State sections, but plentiful from nearby, and demand was limited with market dull; prices on July 26, per bushel hamper, green, \$1 @ 1.50; wax, best, \$1.50 @ 1.75; fancy, \$2; ordinary, 75c @ \$1.25. LETTUCE supplies from up-State sections were again liberal; poor quality stock was neglected, wholesale prices July 26 per crate, Big Boston varieties mostly, 50c @ 75c; some fancy as high as 90c; Orange County Lettuce, 25 @ 65c.

BUTTER MARKET ADVANCES

There was a "bull" market for butter last week. The wholesale prices for

milk for condensing. In Wisconsin, both the Cheese factories and the Condensing Plants have paid better prices than the butter factories.

The Cheese market was unsettled and irregular last week, with a tendency toward further weakness on both New York State and Wisconsin Cheese. State whole milk, flats, fresh, average run, American Cheese were quoted at 24½c, on July 26th.

FANCY WHITE EGGS STEADY

Fancy nearby white eggs moved more freely last week and the market was steady. The top quotation of 45c per doz. for New Jersey, hennerly whites, closely selected extras, continued, and premiums above this price were paid in some instances. Ordinary average qualities of nearby eggs are dull, however, and moving slowly.

The total receipts of all grades of eggs fell off a little last week. Short held cold storage eggs entered directly into competition with fresh receipts, causing a surplus of the latter, which had to be moved into cold storage. In

Quotations From Eastern Markets

The following are the prices at which farm products of special interest to eastern farmers sold on July 26:

Eggs, Nearbys (cents per dozen)			
New Jersey hennerly whites uncandled, extras...	41 @ 45

How Shall We Market the Surplus?

As Broilers or Roasters?—Summer Handling of the Flock

WHILE every roaster is capable, in its younger days, of being a broiler, the most profit on surplus cockerels raised each spring lies in the ability to distinguish between these two classes of birds. Strictly speaking, broilers do not necessarily make good roasters; by chance a few may turn out to be good roasting birds. Leghorns and Anconas are excellent broilers up to two pounds, but they are absolutely incapable of being anything else. On the other hand, a Brahma makes an excellent broiler of three pounds or over, but the real profit of that bird cannot be realized until the weight has reached eight or nine pounds.

Here, then, is one sharp line for the two classes of birds: light birds or breeds should be sold as broilers; very heavy birds as roasters. The real difficulty is, however, to be found among the medium-weight birds, of which the Rhode Island Reds, Rocks, and Wyandottes are typical examples. These types contain both roasters and broilers, and for the most profit, the classes ought to be divided.

All birds lacking good health or vigor ought to be as soon as they are broiler size; likewise cull pullets—that is, birds not true to breeding or off color. With nothing but good, healthy stock left the next step is not very difficult. A good roaster should have a body that is long, deep, and broad; in other words, cull as a broiler the bird that is short and stocky; his very shortness and lack of depth shows that he cannot grow big; he hasn't the room to expand. A good way to start in is to pick out two or three of the best birds and take these birds as your standard; the birds that come about up to them, keep as roasters; make broilers of the rest. You will find that almost half of your birds will fall in one class or the other without much difficulty.

There are some minor points that may help you if some birds are about on the line. A roaster ought to have good quality of flesh and a good yellow color to his skin; a blue tinge is not popular on the market, although as a broiler the bird may get by. A fairly small head with wattles and comb to match are also attractive to commercial buyers. The flesh should show a fairly even distribution with a well-developed breast. If the breast development is poor at the broiler stage, even if the bird is large, put it in the broiler class.

So much for some of the guiding principles in dividing these two types of birds. From the standpoint of profit and loss in the poultry flock all broilers are more expensive than roasters because of the labor involved in caring for young chicks. Secondly, the mortality or actual loss is heavy with the younger birds. The cost of continuing the broiler to the roasting stage is slight; when given free range and plenty of water he will almost take care of himself.

While the actual return on these two classes of birds cannot be made reliable because of the variation of the market prices the country over, a quotation from the New York market gives some idea of the money involved. The prices are for birds sold live-weight, and of course the profit would be greater in both cases if the birds had been sold dressed. Saturday, July 1, 1922, broilers were quoted at 32 @ 40c. Taking the top price throughout for the sake of uniformity, a three-pound broiler would have brought \$1.20. Saturday, November 4, spring chickens were quoted at 19 @ 28c. A six pound roaster would, therefore, have brought \$1.68. As a matter of fact, the Reds, Rocks, Wyandottes, etc., should exceed seven pounds, and properly fattened should average close to eight. The difference then would not be less than 48c a bird, and with proper management ought to run around 75c or better. If the birds are kept on a good range, with plenty of water and some grain, they will reach a good degree of physical development, and may then be fattened for two or three weeks in close confinement so that the lack of exercise and extra feed will make

them put on weight. The price received will not be a broiler price when they are sold, but there will be an added income and you will be getting the most profit out of all the surplus cockerels you raise each spring. The surplus males of the poultry yard are a necessary nuisance because there is no way to avoid their existence, but because of this very existence they should

THE ROOSTER

THE rooster is a lusty bird;
In all the land his voice is heard,
A proud and haughty bird, by heck,
Who flaps his wings and curves his neck.
From east to west, from perch to pole,
His morning bugle echoes roll,
Arousing men from snoring deep
And maidens from their beauty sleep.
He hunts for worms with main and might,
And finding one, with huge delight,
To whet his harem's appetite,
He calls his wives with trill and hum,
Then—humor great, but manners bum—
He eats it up before they come.
Now, whether Red or Plymouth Rock,
One-half is he of all the flock,
And chickens mostly favor dad
In qualities both good and bad.
But when the hatching season's over,
We must restrain this gallant rover,
Must shut him up in lonely state
And keep the layers celibate.
Their eggs will thus repay our toil
When fertile ones would quickly spoil.
The man who'd be a fresh egg booster
Must segregate that old he-rooster.

—BOB ADAMS.

be made to bring in the best available profit, and this can only be done by a recognition of the two classes involved. Sell broilers, but don't overlook the roasters.—L. H. HISCOCK, Onondaga County, N. Y.

FEEDING THE BIRDS IN COOL PLACES

R. I. WEIGLEY

The very hot days of middle and late summer are very hard on laying stock. With the best of hot weather care and feed, there comes a time during this period when the hens will fall off in laying, their combs become pale, their appetites lack and they sit and mope about listlessly. Have you had the same experience with your poultry as I have had every summer until recently? I'm sure you all have had.

I have found a remedy for the hens that works to perfection. It is cheap—costs nothing, in fact—and can be tried by most anybody. This is what I do when the enervating days come along: I scatter every day about three sheaves of wheat to fifty hens in the coolest place

I can find. Try it. If you feed oats, try feeding it in the straw, too.

For several years now, I have fed all my wheat in the straw during the hottest months in this fashion, but I did not stop off any part of their laying ration otherwise. As I said before, I scatter my sheaves in the coolest place I can find. There is a great, dense cherry tree in my orchard run, and here I spread my feast. When the sparrows become too numerous, I use my coolest scratching shed. In the shade of this cherry tree, I am very positive that it is at least 20 degrees cooler than at any other spot on the poultry premises.

I wish you could see my hens during August and September. When I come with the sheaves, they are always ready. How they enjoy picking and scratching out the grains! The oldest, fattest and laziest will join and pitch in. I think, and I feel that I'm quite correct, that the combs of the hens never were redder than now—no, not even during spring, nature's resurrection month. That old egg basket which is used to gather the eggs will again almost be filled to the high spring water-mark.

My hens start to lay heavily during February so that they naturally would slow up toward fall, but since I started to feed them grain in the straw, I can keep them at it to about Thanksgiving. Of course they moult before this, but they keep on laying just the same. Eggs are very high during the moulting season since this is really the time now that the least number are laid. Electric lights and deeper chicken knowledge has made the winter egg the rule rather than the exception.

Unthreshed wheat and oats are just as helpful to the growing chickens as it is to the laying hens. This method of procedure is not unduly forcing the hens. No medicine or drugs are used. The simple truth is that the hens' minds are engaged and taken off the bothersome heat and they are enticed to the coolest spot and away from moping roosts and lethargic emotions. The sight of my hens at work in the shade in full dress, or stubby, or tailless, or a combination of all of these styles together, is a very pleasant one to me. If you are unconvinced, come and see them. You are welcome.

The straw can be used for bedding in the barn.

AVOIDING SOFT-SHELLED EGGS

ELMER WHITTAKER

There are several causes for this occurrence which causes considerable loss in market eggs.

The first and usual cause of soft-shelled eggs is that the bird is too fat. The muscular movement of the oviduct is hindered by layers of fat, and instead of the egg being controlled by firm muscles it merely slips through a flabby mass. The difficulty will vanish if the birds are made to scratch in a clean, dry straw litter for all of their grain, and the ration fed is not too fattening.

Another cause is lack of lime in the hen's ration. In this case the shell secreting part of the oviduct fails to do its work because of the lack of material.

The third reason is the forcing of hens for too frequent egg production. A second yolk breaks off from the ovary, and drops into the funnel of the oviduct, and the first one is forced too rapidly on its way for it, to be completely formed when laid.

A fourth reason is from scouring, that is, from feeding a too loosening ration to your birds.

Poultry Culling—The successful poultrykeeper is culling his flock every few days during the summer and early fall. Just as soon as a hen molts she should be removed from the flock and sold. This cuts down the feed and increases the revenues.

A Square Deal For the Farmer

There Can Be No Durable Prosperity Without a Prosperous Agriculture

IT is undeniable that a considerable measure of prosperity has blessed the United States during the past three years. At the same time it is indisputable that this prosperity has not reached all of the groups composing our citizenry. The prosperity has been absorbed by certain groups to the exclusion of the others. The largest group which has been denied a share is the farmers. Spokesmen for the farmers have been long insisting upon this fact, but until recently the insistence has fallen upon deaf ears. The farmer has long borne the reputation of being a kicker, a reputation perhaps not wholly undeserved. Whether deserved or not it is having this effect, that now the farmer has a real and substantial grievance, he has hard work in convincing the general public of the fact. If the public were open-minded, there would be no difficulty in demonstrating the proposition that not only is the farmer not getting a fair share of the general prosperity, but from an economic standpoint is not receiving a fair deal.

Agriculture Outdistanced

In the early days of this country agriculture was not only the chief industry, but was relatively a lucrative one. With the remarkable growth of the cities during the past fifty years, one would naturally think that the opportunities for making money on the farm would increase. For reasons which for lack of time cannot be discussed in detail now, agriculture has not only not held its own but has been submerged in comparison with industry in general. This process had been going on for many years prior to the Great War, so that at the beginning of that epochal struggle, agriculture was out of balance with general industry. The war with its vast economic disturbances not only did not restore the equilibrium between agriculture and other industry, but served still further to submerge agriculture. So that it is not a mere figure of speech to say that agriculture in its present plight is a war victim in no less accurate a sense than a khaki clad doughboy shredded with machine-gun fire on an European battle field.

It is not sufficient to diagnose and proclaim the disease, but some effort should be made to discover and apply the appropriate remedy. Volunteer doctors with widely advertised cure-alls are not lacking, and herein lies the patient's greatest danger. If agriculture experiments with some of the remedies now so vigorously pressed upon it, its condition already desperate may be rendered hopeless.

Public Treasury Panaceas of no Avail

If agriculture can realize that legislative nostrums and public treasury panaceas will not avail, ground will be gained. Remedies of this kind at best can only be palliatives, and at worst might prove calamitous. The situation does not demand palliatives, but a careful and thorough probing to determine the underlying causes of the disease. The difficulties of agriculture are economic not political. The economic phases should be explored conscientiously and painstakingly,

By **BERNE A. PYRKE**

Commissioner of the Department of Farms and Markets, State of New York

free from bias and hysteria. We need fact finding bodies in order that sound economic conclusions may be drawn. Our national policies should be reexamined with the view of determining their effect upon agricultural prostration. A dispassionate study of our tariff policy should be made to determine its agricultural effect. It is not an impossibility that the steady submergence of agriculture

is simply asking for a modest place in the sun, and a fair share in the good things of life. Anything less is not good for agriculture and by the same token not good for the country as a whole.

Recollections of Roberts' Time

THE writer was greatly interested in the special number in commemoration of Professor I. P. Roberts' ninetieth birthday. We often heard Professor Roberts in the earlier days of the Farmers' Institutes and at the Western New York Horticultural Society meetings. At the latter meetings he always took along some of his boys and they generally gave him a good cheer after his off-hand talks. One of my own boys was one of his pupils and he came home from college saying "Professor Roberts lays great stress on fitting the land properly." He says: "If your land isn't fit, plow it again, plow it three times if necessary!" So we might aptly call him "Plow it three times Roberts." "The good old farmers' institute air seems to be gone. I remember an institute at Ithaca in the good old days in the '80's when a large array of talent was present. Such men as Major E. H. Alvord, H. E. Cook, Seth Fenner, Mr. Woodward being among them. It was at this institute, or about this time that a well-known phrase was coined.

Mr. Seth Fenner was at the question box and to the question, "When is the best time to prune?" he answered, "Prune when the knife is sharp." And to the question, "What is the best variety of apple to plant?" he answered, "I would make them 90 per cent Baldwins and the other 10 per cent would be Baldwins also."

Few readers nowadays probably recognize the name Henry E. Alvord, but he was one of the bright lights in old institute days. It was at the above institute he gave a remarkable address. He was on the program at the evening session for "The General Purpose Cow," and naturally we settled down in our seats expecting a genuine cow talk. If I remember rightly he used the word cow but once in the whole lecture. The lecture in fact was a minute description of the battle of Winchester. We would occasionally look at our program to make sure that no mistake in the subject had

been made and wondered when he would begin talking on the cow. As he drew near the end of his description and came to the climax of Sheridan's illustrious ride to save the battle, extolling especially on the merits of his horse, he exclaimed, "What, think you, would have happened at Winchester that day, and where would the name of General Sheridan been to-day in history had he rode that day a general purpose horse!" That was all he needed to say, and the point came home to us with full force never to be forgotten.—W. A. BASSETT, Seneca County, N. Y.

Thrift is such a simple thing—and it means so much. It is the foundation of success in business, of contentment in the home, of standing in society.—RUSSELL SAGE.

This Is the Go-to-Law Cow

You See How Busy the Lawyer Is. He Is Milking.

Copyright, 1923, by Star Company.

THE LAWSUIT

WHILE YOU GO TO LAW, THE LAWYER GETS THE MILK.

This picture, from an old copy of the *American Agriculturist*, printed sixty-four years ago, shows what the editor of that day thought about going to law. It shows you two men fighting each other in the law court about the ownership of a cow. One pulls the cow's tail, the other pulls her horns. THE LAWYER SITS QUIETLY MILKING.

WHEN NEIGHBORS GO TO LAW, THE LAWYER DOES THE MILKING. That statement by the agricultural editor, so long ago, is one to remember.

THE New York "Evening Journal" of July 27 "ran" the above picture and editorial written by Arthur Brisbane, whose editorials are read by more people than those of any other writer in the world. The New York Sunday "American" of July 29 also carried this same picture and editorial by Mr. Brisbane as well as most of the feature story, entitled "Going to Law," which we published in the *American Agriculturist* of July 14.

during the past several decades is to some extent bound up with our national tariff policy. No less consideration should be given to our national attitude toward immigration. No one would contend that our present immigration policy has produced the present agricultural depression, but it is beyond controversy that the drastic restrictions of the present law are not calculated to remedy the labor stringency, one of the most acute troubles now besetting agriculture.

Entire Country Involved

The whole country is so involved in the welfare of agriculture to aid unstintingly in such a survey, because there can be no durable prosperity in America without a prosperous and contented agriculture. Agriculture is making no unreasonable demands. It

Is a Shorter Farm Day Practical?

Would Shorter Hours Bring Farmers Skilled Workmen's Pay

By H. L. COSLINE

THERE seems to be plenty of discussion about long hours on the farm, both in the farm papers and by word of mouth wherever farmers or farmers' wives congregate. With all the talk, some of which hits the nail on the head and some of which is so wide of the mark that it isn't even in sight of it, perhaps it would be profitable to ask ourselves a few questions in regard to it. A few questions often clear up the atmosphere remarkably, and I don't know of anything handier in an argument. When your opponent begins to shoot questions that you couldn't answer to save your soul, just look wise, don't attempt to answer them, but begin to ask a few questions yourself. The chances are ten to one that you'll find him just as ignorant as you are.

In the first place. "Why do farmers work long hours?" Some farmers would say that it is necessary, in order to make a living, but I have known folks to get cause and effect twisted, so perhaps the facts of the case are, that they can't make a living because they work long hours. The rate of pay that men get seems to vary as the amount of time spent in work varies. The less time spent, the more pay, so perhaps if farmers could shorten their hours, they would take themselves out of the common labor class, where they seem to be placed, and jump up into the skilled labor class.

One of the principal reasons for long hours is the desire to get ahead. A young farmer said to me "I can see a lot of ways to make money, if I could only get time to do the work." Perhaps he didn't realize that it was merely another way of saying that if he could do three men's work, he could get fair returns for one man. Every young man who starts on a farm wants to get ahead, and to him, one of the surest ways of doing it is to put in long hours. It does mean that he gets ahead faster than his neighbor who puts in fewer hours, but counting in all the men who are doing the same as he, it means that they are competing against each other to see who has the most endurance to produce a surplus which brings down the price for everyone.

Another reason, which applies more to the older farmers, is the fact that they are continually seeing work that needs to be done, and because they can't do it in ten hours, they work overtime, not at time and a half,

but without any pay. One man says that he wants to get on a smaller farm where there isn't so much to do, but one of the hardest working men I know, has less than two acres of ground. The Union man doesn't worry about the work that needs doing, but the farmer is working at his own business, so he keeps at it as long as daylight lasts and then sometimes does the chores by lantern light. Some of the men in this class have lost all hope of making more than a mere living, but

a surplus of workmen, they reduced the pay without reducing the hours of work. The only difference with the farmer's condition is that he is working for himself and works longer hours in order to get more returns and then natural laws of supply and demand operate and cause a less return than could have been obtained with less work. It is a well-known fact that farmers frequently are paid more money in a year when weather conditions cause a short crop. Why not get the short crop by putting in fewer hours?

There are other and more far reaching effects than the low returns caused by long hours. It finally results in less time for recreation and improvement, greater difficulty in maintaining the same standard of education, for farm boys and girls, as obtains in cities, and the final draining away into the cities of the most intelligent and progressive young people.

There is also a tendency to return a living wage to a family regardless of the number of people in the family who are working. We have heard instances in so-called sweat shops where the whole family would earn only a bare living by working for long hours, but there are farms where the conditions are nearly as bad. It is no doubt better for farm boys and girls to be busy

rather than idle, but when the time comes that they must leave school at an early age, in order to work, the condition is no longer a healthy one.

Farming is a family occupation, but if the whole family is to secure only the returns that could be secured by one member of the family, it might be a good thing to dispense with the help of the wife and children.

The third question is "Can shorter hours be made practical on a farm?" The first answer that one usually receives to this question is: "Cows must be milked about twelve hours apart, so how can you have an eight-hour day?" True, but what is there illogical about having two shifts? At this time of year there are about sixteen hours of daylight, two shifts would work fine.

I can almost hear the farmers laughing about this statement as though it were a good joke, but one fact is sure and that is that so long as farmers are willing to work long hours to feed the rest of the population with cheap food, you aren't going

(Continued on page 94)

At no time of the year are farmers' days so long as at harvest

still they keep on, "because the work needs to be done."

Another reason which affects a smaller class, is a feeling, that some folks have, that it's a sin to be idle. It doesn't seem to matter whether the work they are doing is returning them a profit or not, so long as they are busy their conscience is easy. In many cases the work they are doing could be done in half the time, by spending a little thought about it, but they are too busy with physical labor to think. This class doesn't need any sympathy because I suppose they are happy. The other folks are the ones who need the sympathy, because they must compete with folks who will work whether they make a profit or not.

Another question that might be asked with profit is: "What are the results of long hours on the farm?"

There is a tendency to pay at least a living wage, regardless of the length of time worked. I suppose that when men first began to hire other men to work for them, they first paid them bigger wages if they would work longer hours, and then, when there was

VOL. 112 August 11, 1923 No. 6

Warren G. Harding

ON a Thursday night in the City facing the Western Seas, the Chief Magistrate of a mighty nation grew weary of his great job and without warning laid down his sceptre. When the sad news flashed across the wings of the night, more than three thousand miles to a little farmhouse near the Eastern Seas, an old Vermont farmer aroused his son and by the light of an oil lamp administered to him, as the one next in line, the inaugural oath of the President of these United States.

Thus does a Democracy carry on.

The sense of personal loss that the death of President Harding brings to every citizen, without regard to political faith, is the best measurement of his greatness. Warren Harding was not a genius, neither probably was he a great executive, nor even a great statesman. Thousands of Americans have as much ability and are as good as was Mr. Harding; but that is the chief reason it seems to us why he was a much-loved President. He was one of us. He was like us. He was "just folks." He was a farm boy who became President, thereby demonstrating again that it is possible for any average boy who works hard and who is sincere and good, to rise to any position in America, even to the greatest one of all. Harding was a simple, kind and good man—and because he was, he was great in the best sense of the word.

But we should not forget

either in our estimate of the man that his was a heart-breaking job. Guiding a people through a reconstruction period is an even greater task than leading them through a war. In war there is enthusiasm, exaltation and glory; but for those who try to build again what the war has destroyed, there is the constant criticism of a world unsettled and embittered by a blood conflict. Through it all Harding kept the faith and died in the harness. He did the best he could, and that best was pretty good. So to-day he is mourned by a hundred million of his people who wish for him rest and peace in that unknown Democracy beyond the Border where he is now a citizen.

Bad Threshing

IT is probably safe to say that at least five per cent, or one bushel in every twenty, of grain is lost to farmers through poor threshing. The loss is particularly heavy in the dairy counties where grain is not as extensively grown as in western New York and central Pennsylvania. In the larger grain growing sections, there are better threshing machines and more efficiency.

How discouraging it is to work hard during the whole season to grow a crop of grain and then have a lot of it wasted through inefficient threshing methods. Time and again we have personally seen grain separators in operation where at least one-third of the grain was going over the carrier still on the straw or else was falling uncleaned into the chaff. Of course, there are a lot of splendid machines kept in fine order by men who know their business; but there is an altogether too large number that waste a lot of money for farmers. Many times it is not the fault of the machine itself, but is due to poor feeding of the grain into the cylinder, or to poor adjustment of some part or parts of the thresher itself.

Farmers can often save themselves a good

deal of money at threshing time by insisting that the operator of the separator get his machine in shape and keep it so.

When Is a Hen Not a Hen?

PIGS may be pigs, but any old bird is no longer a hen. The account in a recent report of the last Cornell Poultry School shows the big strides that are being made among real poultrymen to get rid of the hens that do not pay. For years we have heard much about boarder cows, but little has been said until recently, about boarder hens. Yet, they are just as much a liability in proportion to capital invested, as are the poor cows.

During the recent hard times, the poultry business has been one of the few farm enterprises that has paid fairly well. It has been especially successful where attention has been given to a few fundamental rules of breeding good birds and getting rid of the poor ones. Weeding out the farm flock is a much easier, simpler and shorter process than doing the same thing with the dairy. With a little study and practice anyone can learn in a very short time how to select the hens that do not pay, and a ready market is easily found for them. It will soon be time to make such selection.

Why not get in touch with your county agent or your College of Agriculture, or with some good poultryman, and learn how to pick out and get rid of the hens that the good ones have to support before they can support you?

The Prohibition Vote

STILL the letters and the votes come. Even though this is the busiest time of the year for farmers, hundreds of them are realizing the importance of registering on the question of prohibition, so they are taking the time to send in their votes, many of them giving us well-written arguments pro and con. Ballots will be furnished on request. If you have not voted, won't you do so and get your friends interested? Take the matter up in the Grange and other farm meetings, and help us make the farm opinion count.

Bradfute Addresses Eastern Farmers

Albany Meeting Brings Together Farm Bureau Men of Northeastern States

"MY idea of the fundamental purpose of cooperation in general and of the farm bureau in particular is that you should each help everybody else and that everybody else should help you." This was the fundamental thought of O. E. Bradfute, president of the American Farm Bureau Federation, speaking at a meeting of the northeast group of Farm Bureau Federations held in Albany August 2 and 3. One hundred and fifty farm men and women were present from all of the New England States, New York, Delaware, Pennsylvania and New Jersey.

Mr. Bradfute said that the best definition of the way to cooperate is first to so adjust yourself that the other fellow can work with you. "The attitude," he said, "that the great industries other than agriculture are scheming and working all of the time against the farmers is wrong. The great industries work for themselves and that is just what we as farmers must do. We must apply the same business principles in modern farming that make other business successful. The solution of our problems lies within our own power and in our ability to stand shoulder to shoulder in working them out ourselves."

In speaking of the work and possibilities of the farm bureau organization, President Bradfute said that in the past farmers have often come to meetings, discussed their problems, passed resolutions and gone home. "And there the matter ended, for there was no way of carrying the thought of those resolutions on to the nation and expressing the problems of agriculture to all of the people in such a way as to get action. It is the first purpose of the American Farm Bureau Federation to bring the nation's attention to the problems of agriculture. We believe that this has been done recently as never before for farmers and their representatives are asked, and even begged to come and sit around the table with business men and others and tell what agriculture wants."

In outlining the problems which seemed to Mr. Bradfute to be the most difficult ones facing farmers to-day, he said that the greatest problem of all is organization itself. Agriculture must solve its own problems to a very great extent, and there is no way to do this except through cooperation. The growth of organization, however, "will depend largely upon its ability to solve the other problems. There should be no organization for organization sake."

In discussing transportation, Mr. Bradfute pointed out that it affects every farmer in the United States and that the difficulty of getting his products to market and supplies back to his own farm was one of the limiting factors in his business. He said that finance and marketing were tied up together and then showed what had been done in the way of securing better credit for farmers and how necessary this credit was.

President Bradfute gave considerable time

to the discussion of the wheat problem, saying that "there was too much excitement about wheat, which was resulting in forcing it on to the market too fast." Furthermore, farmers producing many other commodities are having just as many troubles as the wheat farmers. He outlined the plan of the Farm Bureau Federation to solve the wheat problem by holding back in warehouses and granting to farmers warehouse receipts on

New York State College of Agriculture. Mr. Burritt struck a responsive chord in his audience when he emphatically stated that New York and its adjoining States are among the greatest States in the production of farm products and in the placing of those products on the markets through successful cooperative organizations. He made it plain that the American Farm Bureau and other national organizations were not giving our Eastern problems enough consideration.

Mr. Burritt also gave an interesting account of the rise and fall of several national farm organizations, pointing out that no national organization could long succeed if it were based on economical appeal alone.

H. E. Babcock, manager of the G. L. F. Exchange said that cooperative buying of farm supplies is one way out of our present depression. To succeed in such buying, there must be "adequate working capital, efficient and expert management, and large volume of business." No buying organization should be developed unless the farmers are willing to meet all of these requirements.

Howard W. Selby, manager of the Eastern States Exchange, outlined the history and work of that New England farmers' buying cooperative and showed that that organization had made steady growth during the last five years.

Mrs. A. E. Brigden, president of the New York State Federation of Home Bureaus, in a fine talk, said that woman wants to feel that she is of some real use in the world; she wants to be a helper. "How can the farm woman best serve the agriculture of the United States?" was her theme. "No matter what we think is the object of the work that we are all doing, whether it is on the farm or in the factory, the real object is to make better American homes. Home-making is a profession, and there is too little training in our schools and in our homes for the girls and the young women for this profession."

In speaking of the need of children having more milk,

Mrs. Brigden said: "Too many farmers are more interested in keeping the milk can full than they are in giving their children enough milk. Sometimes they will keep the milk out for the young calf, but not for the young child."

W. E. Skinner, general manager of the National Dairy Show and the World's Dairy Congress, to be held October 5 to 13, outlined in an interesting talk what a farmer might expect to see at the Dairy Show.

A resolution was passed late in the evening of August 2, extending the congratulations of the farm men and women present to President Harding in his apparent recovery from his recent illness. But before many of those present had retired, the sad news came that the President had died.

In his opening address on August 3rd, President Bradfute delivered a very fine tribute to the dead President.

THE THIRTIETH CHIEF EXECUTIVE OF THE UNITED STATES
Calvin Coolidge and his family—left to right, Calvin, Jr., John C. Coolidge, the President's father, John, and Mrs. Coolidge

which they could borrow money at the bank. He was very emphatic in his statement that no price-fixing for wheat or other products would ever succeed.

In discussing marketing, Mr. Bradfute said that farmers were good producers, but poor salesmen. "What would you say of Ford, if he made seven thousand automobiles a day, filled his warehouses, and then went on filling the streets of Detroit with them, without any sales machinery whatever for putting them on the market?"

The only exception that his audience took to President Bradfute's fine constructive talk was to his over-emphasis on the needs and importance of Western farming to the exclusion of proper consideration of farm affairs in the East. This lack of consideration of the great agricultural empire of Eastern United States was decidedly emphasized by M. C. Burritt, Director of Extension of the

Right There is where you win or lose.

What goes into the feed trough is what makes or breaks the profits of dairying. Especially is this so at this time of the year when pastures are short and dry.

Without the right kind of grain ration your cows are going to lose flesh, consequently their milk flow is going to lessen. And once a bad slump in production sets in, your herd cannot recover from it in time to produce heavily in the fall season of higher milk prices.

Now, before it's too late, supplement your thinning pasture with a good grain ration. Try **DIAMOND CORN GLUTEN MEAL** in this mixture:

Looking Into the Dark

Growers Should Know More About Their Markets

MUCH has been made of the phrase

By **PAUL WORK**

night (July 16) in the field. The first cutting

"What Happens in the Dark," with special reference to the long trail which produce must follow from farm to table. One of the chief reasons why we do not know what happens in the dark is that we have not looked. Of course,

PAUL WORK

that is not the only reason, but it is a reason that is at least in some degree under our control. Not all producers get to New York even occasionally, but there are hundreds who visit the Metropolis and come away no more market-wise than when they went. Any one who sells a car load of cabbage or potatoes could well afford to travel four hundred miles to spend a couple of nights on the markets of some great city.

A Matter of Business

Most of us feel some diffidence about exploring places with which we are not familiar. Knowing markets is a matter of business and we can well afford to calm our qualms and to move about with freedom and to ask questions as the spirit moves. 'Tis true, one will meet occasional rebuffs. Just pass on and try another. The produce trade is full of men who are courteous and willing to help. It is necessary to remember that the salesmen have their busy hours and if your or some other fellow's shipment of peas or lettuce is not sold at once it is not likely to be sold at all. The best time to see is early. The best time to talk is after the bulk of the trade is over.

There are many ways to secure help in getting acquainted with markets. Talk to your local produce dealer at home before you start. Look up the office of the State Department of Farms and Markets if it is New York. Those in charge will gladly direct you. In other cities find the market master or ask on the market for an officer of the local growers' association. Work up a party from a Grange or local club to make a market trip and arrange in advance for a guide from the city officials or the State Department. The New York State Vegetable Growers' Association might well stage a market trip to New York, perhaps including a tour among the garden sections of Long Island with which very few up-State people are familiar.

Whatever others may or may not do, it is possible for any grower at moderate cost to learn a great deal about the channels through which the things he sells must pass, and the investment of time and money is bound to prove profitable in more ways than one.

* * *

Cutting Early Cabbage

Just to-day I have been taking notes on eighteen short rows of early cabbage. This was the second cutting. Of twenty heads, in one of the rows of Copenhagen, but two will spend this

brought six cents per pound and the second will command the same. No one of the four or five Wakefield strains has done as well for either earliness or weight. Also one strain of Copenhagen is larger and later, not necessarily any poorer but certainly not suited for first early.

It would be interesting to both writer and reader, to say right here and now who produced the good seed of Copenhagen. The most of the samples in the trial came directly from seed growers, so that the identity of the stocks is fairly definite. There are at least three reasons why such findings are not publicly and definitely announced.

Only to Compare Varieties

First, this trial like many others, has not been thoroughly and carefully enough conducted. The purpose was merely to gain an idea of varietal types, not to make an exhaustive comparison of strains.

Second, growing conditions are important. One sort that was of the best last year, lags this, probably because it does not stand drouth as well as some others. Other soils and other locations might give a very different list.

Third, serious difficulties are involved in announcing the relative merit and demerit of commercial commodities. It is difficult to be fair to all.

Definite information as to sources of some seeds is being circulated. This is an experiment worth trying. It remains to be seen how far it can go. Perhaps much can be done in this line. In the last analysis the decision will have to remain with the seed buyer in the light of such help as can be given him.

* * *

Lettuce Competition

Competition between the muckland growers of Big Boston lettuce and the Rocky Mountain growers of Iceberg type lettuce, is very keen this summer. Such varieties as Iceberg, and New York or Wonderful are being tried out in the East.

Big Boston is spoken of as a butter-heading lettuce while the others are called crisp-heading. The latter makes a larger and harder and crisper head but many think it lacks in delicacy.

If the markets want the Iceberg type, however, they will have it and there will be another adjustment to be made in the business—as usual.

* * *

Greenhouse Bulletins

James H. Beattie is the author of two new Farmers' Bulletins that deal with greenhouse management and greenhouse vegetable production.

The first, No. 1318, is entitled "Greenhouse Construction and Heating." It describes types of houses, lays down principles of construction, defines terms used and fully illustrates plans and parts. Much concise information on heating is offered. Small houses for the beginner are treated as well as larger ranges.

The second bulletin, No. 1320, is on "The Production of Cucumbers in the Greenhouse." This is to be followed by others on additional glass-house crops.

New York Horticulturists Hold Meeting at Geneva

J. D. LUCKETT

ABOUT a thousand fruit and vegetable growers and their friends met on the grounds of the Experiment Station at Geneva, last Wednesday, at the summer meeting of the New York State Horticultural Society and the New York State Vegetable Growers' Association.

Several prominent speakers addressed the gathering in the morning. In the afternoon tours of inspection of the Station spraying and dusting experiments with fruit and vegetables, and variety tests of fruit and vegetables led by Dr. U. P. Hedrick, P. J. Parrott, and F. H. Hall of the Station staff proved especially interesting. Many of the growers also made a trip to the Wilson and Jones orchard at Hall, where the Station is conducting a big-scale spraying and dusting experiment with apples.

A tug-of-war between the fruit growers and the vegetable growers was won by the fruit men, in spite of the strenuous efforts of H. S. Duncan of the Department of Farms and Markets, "anchor-man" for the losers. A baseball game between the Horticultural Society and the Farm Bureau, and horseshoe pitching contests between county teams completed the day's activities.

Prominent Speakers Present

Charles S. Wilson of Hall, president of the Horticultural Society, presided at the morning session. Dr. R. W. Thatcher, director of the Experiment Station, welcomed the growers to the Station and spoke briefly of the merger of the Station and the College of Agriculture at Ithaca, pointing out the advantages of the union. Mr. Wilson and R. W. McClure, president of the Vegetable Growers' Association, responded briefly and pledged the support of their two organizations to the Station and its work. Mr. McClure also announced that the vegetable growers planned to meet with the Horticultural Society at the latter's winter meeting in Rochester next January.

A. R. Mann, Dean of the College of Agriculture at Ithaca, spoke at some length on the developments leading up to the merger of the College and Station, the present relationships of the two institutions, and the outlook for the future. The program for the development of the work at Geneva presented to the farmers of the State last summer and, more recently, to the Legislature by Dr. Thatcher, is to be given the full support of the College, said Dean Mann.

"Organize to Cooperate" was the theme of an interesting address by Hon. Peter G. Ten Eyck, member of Congress from the Albany district, and a member of the Congressional Joint Commission of Agricultural Inquiry. Mr. Ten Eyck related some of the findings of this Commission, which devoted eighteen months to an investigation of the agricultural situation throughout the country. It was everywhere evident, said Mr. Ten Eyck, that the farmer must organize to bargain collectively in his buying and selling, just as big business and labor have organized, if he is to secure a fair return for his labor and for the money invested in his farming enterprise.

Cross Speaks for Apple Show

Plans for the New York City apple show, to be held in November, were outlined by T. E. Cross of Lagrangeville, who said that for the show to be a success the individual grower must take it upon himself to see that his fruit is represented, either by private exhibit or through his cooperative. In answer to a plea for donations of apples from growers in order to make possible the gift of at least one apple to every boy and girl who attends the apple show, more than fifty growers pledged one or more barrels of fruit. Mr. Cross said that the growers in the Hudson River Valley were keenly alive to the possibilities for putting New York apples on the Eastern markets through the medium of the apple show.

Wishing continued prosperity to the American Agriculturist.—Mrs. Harry Snyder, Coopersburg, Pa.

In one year
\$2,410,000,000
worth of milk produced

by 23,000,000
Dairy Cows

Milking by hand required
time of 2,300,000 PEOPLE
2 hours a day (if one person
milks 10 cows per hour)

-at the low rate of
10 cents an hour,

The High Cost of Hand-Milking!

There are from 23 to 25 million dairy cows in the United States, which must be milked twice a day. Assuming that one man can milk ten cows an hour, which is fast hand milking, this means that 4,600,000 hours of human labor are required to milk these cows each day. At the extremely low rate of 10c an hour it costs approximately \$460,000 a day just for hand milking—a staggering sum.

But that isn't all. Good hand milkers are scarce and getting scarcer every day. Few people like to milk cows. Hand milking is slow, costly and insanitary. Human labor is too valuable for such work. A De Laval Milker is faster, cleaner, better and cheaper.

Cost to Farmers of the United States in one day
\$460,000.
just for milking!

There are now over 12,000 De Laval Milkers in use in all parts of the country, giving unqualified satisfaction and proving every day that they can milk at least twice as many cows with the same amount of help—thus cutting the cost of milking squarely in two, or enabling twice as many cows to be milked with the same help.

But saving time and labor is only part of the value of a De Laval. Because of its gentle and soothing, yet stimulating and uniform action, cows almost invariably produce more milk when milked the De Laval way than by any other method. Thousands of users have proved this. Some of the best cows in the land have made their records with De Laval Milkers and some of the best milk is produced with it.

If you are milking ten or more cows you are paying for a De Laval Milker. You might as well be getting the benefit from it—you can get one on such easy terms that it will pay for itself.

See your De Laval Agent or write us for complete information.

The De Laval Separator Co.

Among the Farmers

New York County News

MONROE COUNTY beekeepers will sustain a loss of 20% of the normal yield of honey this season, according to F. M. Pillsbury, temporary State bee inspector for Monroe, Livingston and Wyoming Counties. This follows directly upon the heels of statements emanating from Oneida County to the effect that beekeepers there will lose 40 per cent of their yield this year.

Inspector Pillsbury lays the blame for the apparent loss at the door of severe weather during the spring months. He was optimistic regarding the quality of the honey crop, however, since recent rains and intermittent sunshine have aroused the bees from their apparent innocuous lethargy.

The honey industry in the State amounts to \$1,000,000 annually, with 125,000 hives producing 3,250,000 pounds of honey. The oversupply of honey last year brought the price of it down below the normal level and in consequence more was consumed than heretofore. "In an impending sugar shortage people will see the advisability of using more honey," declared Mr. Pillsbury.—A. H. P.

Good Crop in Finger Lake Section

In contrast to the reports from western New York and the eastern Mohawk Valley come reports from the Finger Lake section, that the honey crop is good. C. E. Howard of Geneva, who has in the neighborhood of 1,000 bee colonies this year, is quoted as saying that so far this year the honey crop is a good one, especially in the case of clover honey.

Although the season is only begun, Mr. Howard has taken out between ten and twelve tons of honey. He operated something like twenty apiaries in Seneca and Ontario Counties. Mr. Howard was one of the organizers of the New York State Beekeepers' Association and also held official positions

in that organization. At present he is secretary of the Finger Lakes Beekeepers' Association, which embraces ten counties of central New York.

IN WESTERN NEW YORK

Steuben Co.—We have had fine growing weather of late. Occasional showers have kept growing crops in nice fresh condition. However, we have had not enough rain to hinder harvest or haying in any way. Potatoes are coming on very rapidly, corn is backward, and oats is very short. Spring seedings are a failure or nearly so. Fruit, with the exception of berries, has been a failure this year. There has never been a time, to our recollection, when labor was so scarce or wages as high as they are at the present time. Farmers, with their wives and children, are trying to get their work done. Even if they could hire the help, very many could not pay the cost of labor.—C. H. E.

Genesee Co.—Farmers are very busy harvesting. They have secured nearly all of their hay and the wheat crop is ready to harvest. Crops of all kinds are extra large this year. We have had splendid weather, quite warm and many showers. The crop of beans is looking excellent and since the farmers planted more beans than usual we are looking forward to a big crop. Strawberries, cherries, and currants have been welcomed by all the people and these fruits were extra fine.—J. E. J.

In the Hudson Valley

Washington Co.—The long dry spell was broken on the 16th. Corn is very backward, the acreage of which is normal. The acreage of late potatoes is smaller than usual. Oats are looking very poor. Rye is fine, with a small acreage. Some new seedings are good, while old meadows are all right. Cows have been holding up in milk production fairly well, but are shrinking badly now on account of poor pasture and flies. New milch cows are scarce and bringing good prices. There is no call for other stock.—T. P. P.

Saratoga Co.—The crop of hay now being harvested in this vicinity is of good quality. The yield is also good. The yield of rye is good, oats are fair. Corn seems to be very backward; in fact, all late crops have been affected by the drought. The needed rain came in time to help potatoes that are just setting. Berries are high in price as the hot, dry weather dried them up on the vines. The fruit crop is not looking very promising at present. Cows have been doing well, but are now beginning to shrink in their milk supply. Butter is 50c a pound, eggs 32c a dozen, wholesale. A. A. Barker's valuable herd of sheep suffered recently from the depredation of dogs. Over forty head of sheep and lambs were killed outright and many more injured and mutilated.—E. S. R.

In Northern New York

St. Lawrence Co.—Hay is well along. The crop is fairly large. Help is scarce and farmers are paying big wages, some as high as \$5 a day. The corn crop is quite backward. Strawberries are plentiful, no raspberries as yet. Currants are plentiful. We are badly in need of rain.—H. S. H.

Franklin Co.—Farmers are busy haying. The crop is splendid. Most all other crops such as oats, wheat, corn, and potatoes are not up to the average, although there are some very good fields. We had a most destructive wind and hailstorm on July 20 which blew down barns and silos, unroofed many buildings and damaged crops considerably. The storm is reported to have been most severe in the town of Burke, where several thousands of dollars damage was done to farm buildings alone, to say nothing of crops. Following are farm prices: Hay, \$18 a ton; oats, 55c a bushel; potatoes, 75c a bushel; eggs, 30c a dozen; butter, 44c a pound. The Franklin County farmers' picnic is planned for about August 15, and is to be held in Burlington.—H. T. J.

Eastern Pennsylvania News

OLIVER D. SCHOCK

EASTERN PENNSYLVANIA farmers claim that this season's crop of wheat will not realize the actual cost of production. In many localities dealers are paying only 90 cents per bushel.

The Farmers' Mutual Fire Insurance Companies are levying assessments upon policyholders at an average rate of \$1.50 per \$1,000 insurance. Up to the present time the fire losses through lightning have been smaller than in many preceding years.

The farmers of Lehigh, Berks and Schuylkill Counties are becoming accustomed to seeing deer associate with their cattle in the fields. The deer are increasing in number and Schuylkill and Berks Counties will not permit them to be shot during the next two years to come, the Game Commission having just issued this edict.

Early Irish potatoes in the great potato-growing belt, Berks-Lehigh Counties, proved a disappointment, the aggregate yield being hardly 50 per cent of the normal production. The long-continued drought caused the serious loss to growers. The late potatoes are making a better showing, but the crop will be materially reduced as compared with 1922.

Farms in the Blue Mountain section are overrun with snakes as a result of the long-continued drought, as the reptiles were compelled to visit the valleys to obtain water. Austin Berger, a farmer near Hamburg, made a timely discovery of a rattlesnake in his bedroom. Several persons were bitten by snakes while engaged in farm operations. There is a demand for a State or County bounty for killing rattlesnakes, the only poisonous kinds in this section.

The tobacco fields of Lancaster and York Counties were greatly benefited by recent showers. A special effort will be made to secure a large and representative display of the various kinds of tobacco grown in that great tobacco-growing district at the coming Lancaster Fair. The crop thus far escaped damage from hailstorms.

PENNSYLVANIA COUNTY NOTES

Cumberland Co.—We are having a siege of very dry weather again. The cornfields and gardens are suffering. We had some very destructive hailstorms in some sections of the county. Practically all harvesting is done, except in the case of oats. Hay made a short crop with the exception of alfalfa. Hay is selling from the fields at \$16 to 20 a ton, baled. Wheat was not as heavy as last year, but what has been threshed is turning out fairly well. Much threshing is being done from the field. There would be a great deal more if machines were available. Farmers fear the moth, which is very bad here. Corn looks well, but needs rain. Wheat is 90c a bushel. Corn is the same price as wheat, something unusual here, and the farmers are talking of corn instead of wheat.—J. B. K.

Snyder Co.—We have been having some very good rains during the last week. They were certainly badly needed. In fact, some crops were partly ruined on account of the extremely dry weather. Wheat will only make half a crop. Oats are about the same. The corn crop looks fairly promising, pastures are short, potatoes are small. Threshing grain has started. Wheat is bringing \$1 a bushel; oats, 40c; rye, 70c; corn, 85c; butter, 38c a pound; eggs, 22c; ham, 25c a pound; shoulders, 15c a pound; bacon, 15c a pound; 3 per cent milk, \$2.71 a hundred; 4 per cent milk, \$3.11 a hundred. Not much sickness.—D. D. S.

Crawford Co.—We have had cool nights for the last week and a half. The weather has been very dry. What showers we have had have been very light ones. Almost all of the wheat crop is in the barns and haying is about over. Hay did not make much more than two-thirds of a crop. New seedlings are mostly all dried up. Oats are ripening rapidly and indications are that they will make a very poor crop. Berries are drying up. The milk flow has fallen off about one-half. Butter is 45- to 50c; eggs, 26 to 30c. Fruit is falling off the trees.—J. F. S.

G.L.F. McLaury Bros. Get More Milk with G.L.F. Milk Maker!

RIVER MEADOW FARMS
PORTLANDVILLE, NEW YORK

Dec. 27th 1922

Mr. H. E. Babcock
Gen Mgr. G. L. F. Exchange
Syracuse, N. Y.

Dear Mr. Babcock: After carefully going over the results we are ready to report on the merit of G. L. F. milk maker. As you know we purchased and had delivered in Oct. 60 tons. We fed this to our 300 cows on different River Meadow Farms during the months of October and November. In comparing the amount of milk produced during the 30 days of November with the November of former years we find that we produced 240 - forty quart cans equivalent to 20,400 lbs. more milk in this period than in any Nov. for past 15 years. Furthermore we did not have a sick cow during the time. Approximately one-third of our cows were dry at the time. While this is our first experiment with the feed we are much pleased with results. Yours truly
McLaury Bros

FERRETS—Prices free. Book on Ferrets, 10 cents. Muzzles, 25 cents. BERT EWELL, Wellington, Ohio.

POST YOUR FARM

and Keep Trespassers Off

We have printed on linen lined board trespass notices that comply in all respects to the new law of New York State. We unreservedly advise land owners to post their farms. We have a large supply of these notices and will send one dozen to any subscriber for 60 cents. Larger quantities at same rate. Address:

AMERICAN AGRICULTURIST
461 4th Ave., New York City

The Service Bureau

Leave the American Horticultural Company Alone

ONE of the firms with which we had the most difficulty last summer was the American Horticulture Company, doing business at Des Moines, Iowa. One by one, complaints came in to us, and one by one we tried to get satisfaction for our subscribers.

At first the firm answered our letters and some of those from customers whose orders they had failed to fill; then came form post-cards reporting "serious financial embarrassment," then form letters from an attorney's office, which did not in any way answer the complaint we made.

Finally, silence and a report that the company was out of business. We wrote our unfortunate subscribers that they were out of pocket, so far as we could see, for the sums sent in good faith, and that since the firm had left no trace, we could not pursue them further.

Then, lo and behold, one subscriber received circulars and encouraging letters from this house, apparently able to solicit business and to receive letters with money in them, even if not to answer justifiable complaints against their manner of filling—or neglecting—orders.

There is no danger of last year's victims being stung twice, but some buyers may have been more fortunate last year, while others may be solicited for the first time and be tempted to order.

We advise all American Agriculturist readers to leave the American Horticulture Company strictly alone.

IT MIGHT BE WORSE NEXT TIME

It took only one complaint against them to place M. Fliegall & Sons, 342 Greenwich St., New York, on the black list. The reason was their indifference in trying to straighten the matter out and the insolent way in which they refused to aid our investigation.

Finally we proved, against their continuous opposition, that our subscriber's shipment had been delivered by the American Express Company and signed for. Still the firm was defiant, but finally were forced to agree to a refund.

However, although Mr. Fliegall is a licensed and bonded merchant, and although complaints against him have been few, we feel that his attitude makes him a dangerous consignee for shipments from farmers who cannot be on the spot to protect their interests. The man who refuses to aid in finding the responsibility for a mistake and who tells investigators it is "none of their business" when it is finally traced to him, is not a safe business proposition.

THREE MONTHS VS. FIVE DAYS

Mrs. A. G. of Pa., had been trying for three months to get the balance of her order from a mail-order house. Finally, in despair, she turned the matter over to us.

"Only five days after your letter reached them, my order came," wrote Miss G. "I thank you for your kindness and appreciate the wonderful work you are doing for your subscribers."

ANOTHER BOOSTER FOR A. A.

Turkeys again—five husky specimens went astray and the shipper, Mrs. M. D. B., of New York, promptly turned the matter over to us.

The express company had to investigate, because the consignee claimed never to have received the turkeys. The express company accepted responsibility in the end, however, and a check for \$33.63 went to Mrs. B. "I will continue to boost and subscribe for the American Agriculturist" she wrote.

SUSPICIOUS

Our letter saying that a settlement would be made reached our subscriber, Mrs. J. N. C., of New York, the same day she received a check from the firm of which she had complained.

Mrs. C., had beaded three bags for a

New York firm. She sent them by insured mail and they were lost. But the firm said that she had disregarded their shipping instructions and therefore would have to stand the entire loss.

That didn't seem reasonable, and evidently the firm knew it was not, for as soon as the Service Bureau wrote them, they hastily sent Mrs. C. a check for the sum agreed upon for her work.

IN TIME FOR NEXT WINTER

Another mail-order house investigated a claim which had long hung fire when the American Agriculturist Service Bureau took a hand. As a result our subscriber, Mrs. A. F. R., wrote us from West Virginia:

"At last the refund has come for the entire amount due on my coat. I had tried to get the money ever since last November, but with all my writing I secured no results. Thank you very much for helping me get it."

THEY TOOK THE MACHINE BACK

One of the firms which sells home-knitting machines recently agreed, at our solicitation, to take back a machine purchased by one of our subscribers who could not learn to manipulate it.

We took the matter up with the company, and although it was several weeks before Mrs. A. J. received her check—owing to an adjustment which had to be made for wool—she got it. She wrote "in the nick of time" and was very grateful to the Service Bureau for its good offices.

These machines are not always the money-makers they seem, nor are all purchasers so fortunate as Mrs. J., for the firms rarely take one back.

Is a Shorter Farm Day Practical?

(Continued from page 87)

to hear any long and loud objections from them.

My observation has been, however, that the objection from farmers is not particularly about the long hours, but the long hours together with short pay makes a combination that is far from pleasing.

There are a few things that can be done, but they need concerted action to make them effective. Even if the cows do have to be milked twelve hours apart, it doesn't prevent one from taking time at noon to read the daily paper, and glance over the farm paper. You may feel guilty for a while, when you find that it is half-past one or two by the time the horses are hitched up and in the field, but one can get accustomed to almost anything in time. This is also a good time to cut both production and work by testing the cows for tuberculosis, and don't be in too big a hurry to get the herd back to the old number.

It may not shorten the workday, but it will cut down the hours per week if you will find time to attend the Grange picnic or the Farm Bureau field day, or even the circus when it comes to town. It's easy to say that there is too much work to do, but remember that farming is skilled labor, and skilled labor shouldn't work too long hours. One trouble will be that if a large number of men should cut production in this way, others would conclude that it would be a fine time to cash in, by producing big. Perhaps the Farm Bureau can solve the problem by some agreement among the members as to the hours of work. It surely is a problem that needs organization for its solution.

Of course there would be a big howl by consumers if any concerted action should be taken to bring this about, but farmers have no cause to feel they have a duty to perform in feeding the public without profit. It might be doubted when I say that in 1911 a prominent magazine had a long article on "The High Cost of Living." But it is true, because I read it.

The Brown Mouse—By Herbert Quick

"YOU see," said Jim to his audience, meanwhile pouring the lemonade, "the centralizer creamery is uneconomic in several ways. It has to pay excessive transportation charges. It has to pay excessive commissions to its cream buyers. It has to accept cream without proper inspection, and mixes the good with the bad. It makes such long shipments that the cream spoils in transit and lowers the quality of the butter. It can't make the best use of the buttermilk. All these losses and leaks the farmers have to stand. I can prove—and so can the six or eight pupils in the Woodruff school who have been working on the cream question this winter—that we could make at least six cents a pound on our butter if we had a cooperative creamery and all sent our cream to it."

"Well," said Ezra Bronson, "let's start one."

"I'll go in," said Olaf Hansen.

"Me, too," said Con Bonner.

There was a general chorus of assent. Jim had convinced his audience.

"He's got the jury," said Wilbur Smythe to Colonel Woodruff.

"Yes," said the colonel, "and right here is where he runs into danger. Can he handle the crowd when it's with him?"

"Well," said Jim, "I think we ought to organize one, but I've another proposition first. Let's get together and pool our cream. By that, I mean that we'll all sell to the same creamery, and get the best we can out of the centralizers by the cooperative method. We can save two cents a pound in that way, and we'll learn to cooperate. When we have found just how well we can hang together, we'll be able to take up the cooperative creamery, with less danger of falling apart and failing."

"Who'll handle the pool?" inquired Mr. Hansen.

"We'll handle it in the school," answered Jim.

"School's about done," objected Mr. Bronson.

"Won't the cream pool pretty near pay the expenses of running the school all summer?" asked Bonner.

"We ought to run the school plant all the time," said Jim. "It's the only way to get full value out of the investment. And we've corn-club work, pig-club work, poultry work and canning-club work which make it very desirable to keep in session with only a week's vacation. If you'll add the cream pool, it will make the school the hardest working crowd in the district and doing actual farm work, too."

"Well," said Haakon Peterson, who had joined the group, "Ay tank we better have a meeting of the board and discuss it."

"Well, darn it," said Columbus Brown, "I want in on this cream pool—and I live outside the district!"

"We'll let you in, Clumb," said the colonel.

"Sure!" said Pete. "We hain't no more sense than to let any one in, Clumb. We ain't proud!"

"Well," said Clumb, "if this feller is goin' to do school work of this kind, I want in the district, too."

"We'll come to that one of these days," said Jim. "The district is too small."

Wilbur Smythe's car stopped at the distant gate and honked for him—a signal which broke up the party. Haakon Peterson passed the word to the colonel and Mr. Bronson for a board meeting the next evening. The picnic broke up. Jim walked across the fields to his home. He turned after crawling through a wire fence and looked longingly at Jennie as she was assisted into the car by the frock-coated lawyer.

"You saw what he did?" said the colonel, as he and his daughter sat on the Woodruff veranda that evening. "Who taught him the supreme wisdom of holding back his troops when they grew too wild for attack?"

"He may lose them," said Jennie. "Not so," said the colonel. "A Brown Mouse succeeds when he finds his environment. And I believe Jim has found his."

"Well," said Jennie, "I wish his environment would find him some clothes. It's a shame the way he has to go looking. He'd be nice-appearing if he was dressed anyway."

"Would he?" queried the colonel. "I wonder, now! Well, Jennie, I think it's up to you to act as a committee of one on Jim's apparel."

CHAPTER XVII

A TROUBLE SHOOTER

A SUDDEN July storm had drenched the fields and filled the swales with water. The cultivators left the corn until the next day's sun

and a night of seepage might once more fit the black soil for tillage.

A lithe young man with climbers on his legs walked up a telephone pole by the roadside to make some repairs to the wires, which had been whipped into a "cross" by the wind of the storm and the lashing of the limbs of the roadside trees. He had tied his horse to a post up the road, and was running out the trouble on the line, which was plentifully in evidence just then. The line repairer was cheerfully profane, in the manner of his sort, glad by reason of the fire of summer in his veins, and incensed at the forces of nature which had brought him out through the mud to the Woodruff District to do these piffling jobs that any of the subscribers ought to have known how to do themselves, and none of which took more than a few minutes of his time when he reached the seat of the difficulty.

Jim Irwin, his school out for the day, came along the muddy road with two of his pupils, a bare-legged little boy and a tall girl with flaxen hair—Bettina Hansen and her small brother Hans, who refused to answer to any name other than Hans Nilsen. His father's name was Nils Hansen, and Hans a born conservative, being the son of Nils, regarded himself as rightfully a Nilsen, and disliked the "Hans Hansen" on the school register.

HANS strode through the pool of water which the shower had spread completely over the low turnpike a few rods from the pole on which the trouble shooter was at work, and the electrician ceased his labors and rested himself on a cross-arm while he waited to see what the flaxen-haired girl would do when she came to it.

Jim and Bettina stopped at the water's edge. "Oh!" cried she, "I can't get through!" The trouble shooter thought it best on the whole to leave the matter in the hands of the lank schoolmaster.

"I'll carry you across," said Jim, "I'm too heavy," answered Bettina.

"Nonsense!" said Jim.

"She's awful heavy," piped Hans.

"Better take off your shoes, anyhow!"

Jim thought of the welfare of his only good trousers, and saw that Hans' suggestion was good; but a mental picture of himself with shoes in hand and bare legs restrained him. He took Bettina in his arms and went slowly across, walking rather farther with his blushing burden than was strictly necessary. Bettina was undoubtedly heavy; but she was also wonderfully pleasant to feel in arms which had never borne such a burden before; and her arms about his neck as he slopped through the pond were curiously thrilling. Her cheek brushed his as he set her upon her feet and felt, rather than thought, that if there had only been a good reason for it, Bettina would have willingly been carried much farther.

"How strong you are!" she panted.

"I'm awful heavy, ain't I?"

"Not very," said Jim, with scholastic accuracy. "You're just right. I mean, you're simply well-nourished and wholesomely plump!"

Bettina blushed still more rosily.

"You've ruined your clothes," said she. "Now you'll have to come home with me and let me—see who's there!"

Jim looked up at the trouble shooter, and went over to the foot of the pole. The man walked down, striking his spurs deep into the wood for safety.

"Hello!" said he. "School out?"

"For the day," said Jim. "Any important work on the telephone line now?"

"Just trouble-shooting," was the answer. "I have to spend three hours hunting these troubles, to one in fixing 'em up."

"Do they take much technical skill?" asked Jim.

"Mostly shakin' out crosses, and puttin' in new carbons in the arresters," replied the trouble man. Any one ought to do any of 'em with five minutes' instruction. But these farmers—they'd rather have me drive ten miles to take a hair-pin from across the binding-posts than to do it themselves. That's the way they are!"

"Will you be out here to-morrow?" queried the teacher.

"Sure!"

"I'd like to have you show my class in manual training something about the telephone," said Jim. "The reason we can't fix our own troubles, if they are as simple as you say, is because we don't know how simple they are."

"I'll tell you what I'll do, Professor," said the trouble man. "I'll bring a phone with me and give 'em a lecture. I don't see how I can employ the company's time any better than in beating a little telephone sense into the heads of the community. Set the time, and I'll be there with bells."

BETTINA and her teacher walked on up the shady lane, feeling that they had a secret. They were very nearly on a parity as to the innocence of soul with which they held this secret, except that Bettina was much more single-minded toward it than Jim. To her he had been gradually attaining the status of a hero whose clasp of her in that iron-armed way was mysteriously blissful—and beyond that her mind had not gone. To Jim, Bettina represented in a very sweet way the disturbing influences which had recently risen to the threshold of consciousness in his being, and which were concretely but not very hopefully embodied in Jennie Woodruff.

Thus interested in each other, they turned the corner which took them out of sight of the lineman, and stopped at the shady avenue leading up to Nils Hansen's farmstead. Little Hans Nilsen had disappeared by the simple method of cutting across lots. Bettina lingered, standing close by Jim Irwin.

"Won't you come in and let me clean the mud off you," she asked, "and give you some dry socks?"

"Oh, no!" replied Jim. "It's almost as far to your house as it is home. Thank you, no."

"There's a splash of mud on your face," said Bettina. "Let me—" And with her little handkerchief she began wiping off the mud. Jim stooped to permit the attention, but not much, for Bettina was of the mold of women of whom warriors are born. Their faces approached, and Jim recognized a crisis in the fact that Bettina's mouth was presented for a kiss. Jim met the occasion like the gentleman he was. He did not leave her stung by rejection; neither did he obey the impulse to respond to the invitation according to his man's instinct; he took the rosy face between his palms and kissed her forehead—and left her in possession of her self-respect. After that Bettina Hansen felt, somehow, that the world could not possibly contain another man like Jim Irwin—a conviction which she still cherishes when that respectful caress has been swept into the cloudy distance of a woman's memories.

Pete, Colonel Woodruff's hired man, was watering the horses at the trough when the trouble shooter reached the Woodruff telephone. County Superintendent Jennie was on the bench where once she had said "Humph!" to Jim Irwin.

"Anything wrong with your phone?" asked the trouble man of Pete.

"Nah," replied Pete. "It was on the blink till you done something down the road."

"Crossed up," said the lineman. "These trees along here are fierce."

"I'd cut 'em all if they was mine," said Pete, "but the colonel set 'em out, along about sixty-six, and I reckon they'll have to go on a-growin'."

"Who's your school-teacher?" asked the telephone man.

The county superintendent pricked up her ears—being quite properly interested in matters educational.

"Feller name of Irwin," said Pete.

"Farmer, eh?" said the lineman interrogatively. "Well, he's the first farmer I ever saw that recognized there's education in the telephone business. I'm goin' to teach a class in telephony at the schoolhouse to-morrow."

"DON'T get swelled up," said Pete. "He has everybody tell them young ones about everything—blacksmith, cabinet-maker, pie-founder, cookie-cooker, dressmaker—even down to telephones."

"He must be some feller," said the lineman. "And who's his star pupil?"

"Didn't know he had one," said Pete. "Why?"

"Girl," said the trouble shooter. "Goes to school from the farm where the Western Union brace is used at the road."

"Nils Hansen's girl?" asked Pete.

"Topsy little filly," said the lineman, "with silver mane—looks like she'd pull a good load and step some."

"M'h'm," grunted Pete. "Bettina Hansen. What about her?"

Again the county superintendent, seated on the bench, pricked up her ears.

"I never wanted to be a school-teacher as bad," continued the shooter of trouble, "as I did when this farmer got to the low place in the road with the fair Bettina this afternoon when they was comin' home from school. The water was all over the road—"

"Then I win a smoke from the road-master," said Pete. "I bet him it would overflow."

"Well, if I was in the professor's place, I'd be glad to pay the bet," said the worldly lineman. "He carried her across the pond, and her a-clingin' to his neck in a way to make your mouth water."

"I'd rather have a good cigar any ol' time," said Pete. "Nothin' but a yaller-haired kid—an' a Dane at that. I had a dame once up at Spirit Lake—"

"Well, I must be drivin' on," said the lineman. "Got to get up a lecture for

TO REMIND YOU OF WHAT HAS HAPPENED

AT the Fourth of July picnic, County Superintendent Jennie Woodruff discovers that Jim Irwin is rapidly becoming a power in the community. She has had to try him for incompetence, but the school children, taught by his strange new methods, have passed their test with flying colors. The school has also given an exhibit at the county fair which attracted much attention to Jim's unusual work. Jennie is just beginning to appreciate her old sweetheart, but her father, Colonel Woodruff has long suspected Jim of being a "Brown Mouse."

Professor Irwin to-morrow—and maybe I'll be able to meet that yaller-haired kid. So long!"

The county superintendent recognized at once the educational importance of the matter. She made a run of ten miles to hear the trouble shooter's lecture, and she saw the beginning of an arrangement under which the boys of the Woodruff school took the contract to look after easily-remedied line troubles on the basis which paid for a telephone for the school, and swelled slightly the fund which Jim was accumulating for general purposes.

She had no curiosity to which she would have confessed, about the relations between Jim Irwin and his "star pupil," that young Brunhilde—Bettina Hansen; but her official duty required her to observe the attitude of pupils to teachers. Clearly, Jim was looked upon by the girls, large and small, as a possession of theirs. They competed for the task of keeping his desk in order, and of dusting and tidying up the

The Fun of a Hobby

Ideas For Spare Time Relaxation

DO you know any busy middle-aged woman who does anything just for fun? She goes from one task to another—this must be done, that can not be postponed till to-morrow. The one idea is to get through all of to-day's necessary things before she drops tired out into bed to get rested for to-morrow.

To such a woman the mental rest of even half an hour a day devoted to some interesting hobby, as suggested by a recent writer in the *American Agriculturist*, would be incalculable. If she has any special talent, even a small one, to cultivate it would be to follow the line of least resistance. Perhaps she looks with keen joy at the color all round her, the fresh greens of summer or the softly-shaded grays and browns of winter, rose and white fruit blossoms shining against vivid blue sky, flaming scarlet and gold maples or deep bronze oaks. Why not try to reproduce it on canvas? No matter how crude the result, the attempt would be a distinct pleasure, and there would always be the possibility of an undiscovered streak of real artistic talent.

Or the same talent might be developed with a good kodak. The exhibitions of artistic and original photographs show us really beautiful pictures, not necessarily of scenes of wonder in remote places, but of bits of beauty and picturesqueness easily accessible around us.

An Idea for a Flower Show

To grow flowers is a most delightful hobby. All winter one may have happy half-hours in caring for them indoors, studying their habits and possibilities, making plans for the outdoor garden, perhaps specializing in one particular flower, roses or dahlias or sweet peas, planning each year to have some new variety, some special soil preparation to give them a little better chance—doing it for fun! In many neighborhoods there are enough garden-loving women to make it possible to arrange an occasional flower-show. Competition is stimulating and we can all get suggestions from seeing what others are doing. Offer a few prizes, a dozen new rosebushes, a comfortable garden kneeling-mat, (very pretty ones come at \$1.50) or a sharp pruning knife of stainless steel. At the height of the blooming season have the flower-show, arranged by a competent committee, on the lawn and veranda of an attractive home, or of the church. Charge a small entry fee for the exhibits and for entrance to the show, wear your prettiest summer gowns and make everything attractive for a social festivity. Then use the proceeds perhaps for setting out shrubs and otherwise beautifying the grounds of the church or community house.

Reading Opens a New World

Some workers are mentally or physically too tired for any sort of systematic study or reading, but if one can take up any such line, what a door is opened into another world! The garden books now so abundant afford a fascinating subject. Or take a certain period—colonial days in America, the days before the Civil War, the times of Napoleon, or of Queen Victoria, and read history and biography and fiction all of that period. Or, if your mind runs in the direction of the pen, find out if you have the faculty of expressing yourself in verse or prose, or in the lively and natural letters which so few nowadays take the time to write.

Or make a hobby of some form of beautiful handwork, knitting or embroidery or basket work or raffia, using your own inventive ability and doing something which no one else does, not too useful, something you really do for fun. I slept not long ago in a huge, four-posted mahogany bed, which I had to get up to by a little flight of steps, under a wonderful coverlet crocheted of white cotton in a pattern of large raised shells, with a deep hand-knotted fringe all around it. It must have been the work of some woman's hands for years. Was it worth while? I don't know. But I know it meant to that woman a sort of half work, half play,

which was to her at once a rest, a distraction from who knows what sorrows or worries, and an outlet for a love of beauty. While she was working she wasn't cooking or sewing or washing dishes or doing anything because she felt she ought to. She was doing something just for fun!—ELIZABETH ELLIOT.

Keep on hand a quantity of straws, either the kind used at soda fountains or clean straws from the grain before threshing.

A sick child will drink through a straw when it refuses a glass or cup and sometimes will willingly take medicine through the straw.

They are inexpensive and sanitary also.—MRS. FRANKLIN FLOWER.

OUR PATTERN SERVICE

A TWO-MATERIAL dress of simple style is **No. 1806**, which offers possibilities for a make-over of last year's dresses or for the use of inexpensive remnants. It also is very easy to make.

No. 1806 cuts in sizes 16 years, 36, 38, 40, 42 and 44 inches bust measure. Size 36 takes 2¼ yards of 36-inch material, 1¾ yards of 36-inch material contrasting and 3¼ yards binding. **Price 12c.**

A BOY is very sensitive if he is kept in "babyish clothes" too long and **No. 1807** is a mannish suit into which he will gladly graduate.

No. 1807 is cut in sizes 4, 6, 8, 10 and 12 years. Size 8 requires 2½ yards of 36-inch material. **Price 12c.**

THE bloomers of **No. 9461**, a cunning style for the weeny one, are gathered to a short waist which fastens at the center-back. Sleeves are cut in one with the waist.

No. 9461 is cut in sizes 1, 2 and 4 years. Size 4 requires 1¾ yards 36-inch material, with ¼ yard contrasting and 2¾ yards binding. **Price 12c.**

THE simple straight lines of **No. 1741** make it desirable for warm days—and for the woman who knows very little about the art of sewing.

No. 1741 cuts in sizes 36, 40, 44 and 48 inches bust measure. Size 36 takes 3½ yards 36-inch material, with ¾ yard contrasting. **Price 12c.**

To Order: Enclose correct amount (preferably in stamps). Write name, address, and numbers clearly, and send to Fashion Department, *American Agriculturist*, 461 Fourth Avenue, New York City.

The summer catalogue contains fascinating designs for all the family. Only 10c! Get your copy now.

Reflections in the Home

Making Work Simpler and the Home Prettier

It is not necessary to be an interior decorator to know that a mirror is an attractive addition to a gloomy room.

If you have a room with insufficient light, try hanging a mirror in the darkest corner so that it will reflect the light from an opposite window. The room will seem much lighter. A room having but little furniture will have the appearance of being well furnished through the aid of mirrors and their reflections.

The monotony of a large wall space may be broken up by hanging a good-sized mirror on it. This will be much more effective than a cheap picture, especially if opposite a window where it reflects outdoor scenery.

Nothing is quite so quite beautiful over the mantel as a rich mirror. If you have mirrors in your dining-room doors you will find the reflections of china and cut-glass make your room more elegant. And the flowers on your table! How they multiply in beauty through the agency of mirrors!

Just a little natural taste for harmony will suggest many uses for the mirror even if one has a meager pocket-book. By keeping in touch with second-hand stores, it is often possible to obtain handsome mirrors at reasonable prices. Even if the frames are marred the mirrors can be used to good advantage.

Frames should harmonize with the color scheme of the room. This is not difficult. The frames may be refinished to suit your taste, first applying a coat of wood polish, then adding paint, enamel or stain as desired. Another way of treating the old mirror is to remove the frame and add moulding to match the furniture.

Many pretty effects may be worked out in the bedroom. Enamel the frame of a long mirror in white and hang over an old-fashioned bureau also enameled in white. I have also seen an old-style mirror in a walnut frame with oval top hanging in the darkest corner of a bedroom with cream walls. It was used in connection with a home-made dresser, and brightened the room as well as being useful.—LEILA HALL HALLOCK.

A BABY'S SECOND-YEAR DIET

At twelve months, the baby should have become accustomed to certain vegetables and fruits—cooked and strained greens, carrots, celery, tomatoes, asparagus; and of the fruits, orange, prune juice and the juice of fresh ripe pineapple, peaches and apples.

This list should be gradually increased during the second year to include potatoes, turnips, beets, peas, string beans, and squash. Never try more than one new vegetable during the day and start with a teaspoonful. As the baby's teeth develop and he learns to chew, the vegetables may be mashed or chopped finely, but need not be put through a sieve.

Baked apple pulp, apple sauce, prune pulp, stewed apricots, peaches and pears may also be added.

For energy foods the baby should have well-cooked cereal and bread thoroughly dried in the oven. Unsweetened crackers may occasionally be given instead of bread or cereal.

The baby will also enjoy a coddled, poached or soft-boiled egg—again started with just a teaspoonful. Of course, the diet will contain milk—1½ pints to 1 quart a day, to drink and as junket, custard, milk, soup, etc. Be sure that the milk is clean and pure, and left cold and covered until ready for use.

GRANDMA'S KITCHEN BEDROOM

"Such a place for a bedroom!" was the scornful modern opinion. And so grandma's kitchen-bedroom had been put to many ignoble purposes—store-room, play-room, general catch-all.

"But it is so pleasant," said the last granddaughter to move into the old house. "I've a notion to try it."

Now, after several years' use: "I wouldn't know what to do without it," she declared. "It is right here so that

we can readily hear in the night the slightest noise at the barn or anyone coming in at the driveway.

"It's so handy to slip in here for a clean apron or to tidy my hair. I can lie down for a few minutes right where I can keep track of everything—the kettle over the fire or the children on the back porch. I get many a little rest that I'd never get if I had to go upstairs to lie down."

"I've really never before taken any comfort in the morning after Fred gets up and starts the fire. I know of several farmhouses burning because the husband built a fire and went out to the barn while the wife, in a distant part of the house, dropped asleep and the stove and pipe became overheated. That fear no longer haunts me because I can see the stove from my bed."

"Then, it is so cozy and comfortable. About four months out of each year

THE TWO GARDENS

MY neighbor has a garden
Where bulbs of daffodil
Await the call of April
Their treasured gold to spill;
But yonder on the hillside
By a dying chestnut tree,
Beneath a melting snowdrift,
Arbutus buds for me.

But while her days are lingering
For her dearest flowers to grow;
Fair lilies tall and stately,
As pure and fresh as snow;
My thoughts turn from the winter
With a deep untamed desire
To wander in the pasture,
When azaleas flame like fire.

Yet even when the summer
Is dying with the frost,
Chrysanthemums will blaze forth
The heat that August lost;
I know an icy streamlet,
Where tall on either side
The autumn's purple asters
Will bank as for a bride.

Nearby her kitchen windows
Her flowers cheer her work,
While mine are ever calling
And bidding duties shirk;
A riot of scents and colors
To her they daily yield,
While mine are hourly tempting
To wander far afield.
—NORA DEL SMITH GUMBLE.

we have cool nights and mornings while it is not cold enough to keep the furnace running. My room is always warm for dressing and undressing.

"Say what you will, the kitchen is the real heart of the farmhouse. There have to be longer hours of work, more fire, more hot water, more interest and activity here than in the kitchen of town-dwellers."

"I rather think Grandma knew what she was about when she built her pleasant kitchen-bedroom!"

—ALICE MARGARET ASHTON.

HOME-MADE MUSTARD

Prepared mustard which outrivals by far any that I ever saw in the stores is made as follows:

One quart good cider vinegar, 1 cup sugar, ½ tablespoon salt. When boiling, add 2 heaping tablespoons flour, 1 level tablespoon corn starch, 1 heaping tablespoon ground yellow mustard, and 1 heaping teaspoon tumeric, which have been mixed dry and then made smooth in water. Mix to a thin consistency, then add 2 well-beaten eggs and stir thoroughly before adding the mixture to the boiling water and let boil up, stirring meanwhile.

This is delicious on meats and vegetables and is also fine for making salads.—C. L. B.

Green tomatoes are excellent for mince meat. Add the juice from sweet tomato pickle after the pickle is used.

PEACE DALE
YARNS

The POSTAL LIFE Insurance Company

"Growing
like a bank"

"Its
policyholders
are its
depositors"

"Agents do not
bring them
in"

Words of
Praise from
Those Who
Know

(SCENE: After dinner at the Club: Banker Allwyn is chatting with Goodsell, a real estate broker, formerly a life-insurance man, and the question of insurance protection comes up.)

Allwyn: "After all, brother Goodsell, I want to tell you something which is a sure boost for the business you used to be in, and that is when a man asks me for credit I always ask him how much life insurance he carries."

Goodsell: "And I reckon you also ask him what companies he's in."

Allwyn: "Oh, I don't bother so much about the companies; like the churches, they're all good; they have to be, don't they?"

Goodsell: "Sure thing. State supervision looks out for that."

Allwyn: "Of course the oldest companies are mentioned more frequently, but the comparatively younger ones also bob up pretty often, and particularly the Postal Life."

Goodsell: "Why, the Postal's not so very young. I remember because I used to fight it 15 years ago."

Allwyn: "I was sound from the start, wasn't it?"

Goodsell: "Yes, 'twas sound but it was—well—well, we said it was an experiment."

Allwyn: "Why?"

Goodsell: "Oh, because it got business direct, personally at the Home Office or by mail and didn't send out agents or have branch offices."

Allwyn: "Well, even so, the Company seems to have made good all right."

Goodsell: "Sure thing; it has policyholders in every State, and in Canada, too, and has its own building on Fifth Avenue at 43d Street. I believe there is no company better known in our country."

Allwyn: "What do you consider the strong points that helped the Postal win out?"

Goodsell: "Well, low cost, dealing direct with the public, and the privilege to pay premiums monthly if one so desires; then there's a 9½% annual dividend guaranteed in the policy, and there's a free medical examination through the Company's Health Bureau which helps keep its policyholders 'fit.'"

Allwyn: "That's pretty good, isn't it?"

Goodsell: "Sure thing; and I want to tell you that just as soon as I can afford to take out another policy, it's going to be in the Postal."

Allwyn: "That seems to me to be good sense, for it's based on safety, saving and service. Why, the Postal Life is growing just like a bank; its policyholders are its depositors—agents do not bring them in. And now I want to put you wise to something else: I've carried a Postal Life policy for ten years or so myself, but didn't tell you about it for I just wanted to 'feel you out.'"

Goodsell: "Well, the reaction, as they call it, was O.K., wasn't it?"

Allwyn: "It certainly was and it's kind of pleasant to feel that each of us has a highly-prized mutual friend in the Postal. Isn't that so?"

Goodsell: "You've said it, and unless I miss my guess, we'll both prize the Postal Life more as time goes on, and there are over 25,000 other policyholders who feel the same way."

Allwyn: "Now you've said it. Have a fresh cigar."

The foregoing business chat is typical of many others that must be taking place, since similar sentiments are reflected in letters that come to the Company from far and near, in praise of its method and in appreciation of its treatment. It is indeed the Company of

Safety, Saving, Service

To find out what you can save and to enjoy Postal service, simply send in the Coupon or write and say:

"Mail me official insurance information as mentioned in the American Agriculturist of August 11th."

In your first letter be sure to give

1. Your full name
2. Your occupation
3. The exact date of your birth

No agent will be sent to visit you. The Postal, as stated, has no agents, and the resultant commission savings go to you, because you deal direct.

Reviewing the Latest Eastern Markets and Prices

POTATO MARKET FIRM

HERSCHEL H. JONES

WHILE trading in the New York City market for potatoes is light, there is a good demand for carefully graded stock. The shipping season on the Eastern Shore of Virginia is practically over. Cars from that section, although few in number, were selling last week for prices ranging from \$4.50 @ 5.50 bbl., most of them from \$5 @ 5.25.

Potatoes from Maryland branded stocks, were being sold at about the same price.

A few cars have been rolling from South Jersey at higher prices. Quotations on the best stock ranged from \$4.25 @ 4.50 per 150-lb. sack at the loading point. The digging, providing the weather is favorable, will increase within the next week or ten days.

On the north side of Long Island most of the potatoes were still being shipped in barrels. A few cars have been sacked. Prices on the Long Islands in barrels ranged from \$4.75 @ 5.25; in sacks, 150 lbs., from \$4.25 @ 4.75. On the south side of Long Island, with the exception of some Cobblers, very few growers have been marketing their potatoes. Conditions are quite favorable and a good crop is expected. The price talk is \$1.50 per bushel or better. Compared with last season, when prices dropped as low as 45c, the prospects are pleasant indeed.

GREEN VEGETABLES QUIET

Lettuce growers shipping to the New York City market met with the lowest prices imaginable and some of the commission merchants stated that at times "we couldn't give it away." It seems that a great many more cars than usual landed in New York, and in spite of the fact that crates sold from 10c up, some cars had to be dumped.

Beans sold lower and the poor stock barely moved at extreme prices. Most of them came in from New Jersey.

Prices on stringless ranged from \$1.50 @ 3.50 per basket; green, \$1 @ 2; wax, 50c @ \$2.25; Long Islands, per bag, 25c @ \$1.25.

Peas came in more freely and the buyers had the advantage. State Telephone Peas sold from \$2 @ 2.50 per basket; other kinds from \$1.50 @ 2, in bags. Some went a quarter higher.

There is a good demand for fancy green corn and prices held from \$2.50 @ 3.50 per sack.

Tomatoes also were firm with supplies arriving from Maryland, Delaware, South Jersey, Keyport, and nearby sections. The Keyports brought the best prices, from \$3.50 @ 6 per crate; South Jerseys, 20-qt., \$1.50 @ 3.50; State, per carrier, \$3.50 @ 4.

Celery, regardless of the light supply, met a slow demand. State sold from 18 @ 25c.

Yellow onions from Massachusetts sold from \$3 @ 3.25 per 100-lb. sack.

FRUIT MARKET DULL

State Dutchess apples in liberal supply moved slowly with prices from \$1.50 @ 1.75 because of ordinary quality.

Peaches sold at lower prices with a weaker market, most of them coming from the South. Jersey Sixes Green-borers sold from 75c @ \$1.25; Car-mans, \$1.25 @ 1.75; poor stock, down to \$1.

SMALL FRUIT SUPPLY LIGHT

Supplies of blackberries and black-caps from Hudson Valley were light. Blackberries, per qt., 25 @ 27c; some as high as 30c; small, 20 @ 22c; Black-caps, per pt., 10 @ 12c. State cherries from Hudson Valley, 4-qt. basket, Red, sour, 85c @ \$1; small, 75 @ 80c.

Currents, Gooseberries, and Rasp-berries from nearby State sections were in light supply. Last week Currant prices, per qt, for red were 11 @ 13c; black, 20 @ 25c. Gooseberries, 4-qt. basket, 85c @ \$1. Raspberries, on account of poor quality, sold as low as 8c per pt. There was a good demand for sound, fancy stock, and prices on the best ranged from 15 @ 25c.

UTAH EGGS IN NEW YORK

All the world seems to pick New York as a market for its eggs. Now, Utah, through the Utah Poultry Pro-

ducers' Association, promises to send to New York fancy graded eggs equal in standard to those from Petaluma. After all the rest of the United States has organized to give New York City perfectly uniform, high quality eggs, the nearby producers may begin to apply modern marketing methods. Of course, some are doing it now, but there seems to be plenty of opportunity for the distant producer to find an outlet

With the increase in the supply of broilers the market tendency was in the buyers' favor. Large fowls met a good demand. Those under four pounds sold at lower prices with a weak market feeling. Colored fowls reached 36c last week. White Leghorns of poor quality sold as low as 19c.

Broilers were in heavy supply and the demand dull. Broilers, colored, 34 @ 36c; large Leghorns, 31 @ 32c;

slowly. Best veals sold for 16 @ 19c per lb., poor as low as 10c.

Lambs arrived in better quality and the demand improved. The best stock sold for as high as \$15 cwt.

CASH GRAIN QUOTATIONS

Cash grain quotations August 3 were as follows:

New York—Corn, No. 2 yellow, \$1.06½; No. 2 mixed, \$1.05½; No. 2 white, \$1.07½. Oats—No. 2 white, 52½ @ 53c; No. 3 white, 51c; ordinary white clipped, 51 @ 52½c.

Chicago—Corn, No. 2 white, 87¼ @ 87½c; No. 2 yellow, 88 @ 89c. Oats—No. 2 white, 40 @ 41c; No. 3 white, 37½ @ 39c. Barley, 62 @ 65c. Rye, 66.

BETTER HAY ARRIVING

Last week the new hay which arrived was of excellent quality. No. 1 Timothy sold for \$27 per ton. Lower grades as low as \$21.

A NEW SWEET CHERRY

A new sweet cherry, comparable in every way to the Black Tartarian, but ripening from a week to ten days earlier than any cherry now grown and from two to three weeks earlier than the Tartarian, is the latest contribution of horticulturists at the New York State Agricultural Experiment Station at Geneva. The new cherry, named the Seneca, is a cross between an unknown variety and Early Purple Guigne, fruited for the first time in 1922 with a full crop. The variety has produced a full crop again this season and all the fruit had ripened by June 26, fully ten days ahead of either parent or of any other variety. Dr. Hedrick states:

"The Seneca, a station seedling, gives promise of becoming one of the most popular sweet cherries for the home planting and may have the same commercial possibilities that the Black Tartarian now enjoys. The tree is apparently hardy and the prospects are that the variety will be a prolific and annual bearer. The fruit is large for a sweet cherry, smooth, purplish black, and has an unusually pleasant, spicy flavor."

Following the usual practice in regard to the introduction of the new fruits developed by the New York Agricultural Experiment Station, trees of the Seneca will be distributed for further testing by the New York State Fruit Testing Cooperative Association, Inc., probably in 1924, when it is hoped to have a sufficient number of trees available for that purpose.—A. H. P.

If it is farm news, you will see it in the American Agriculturist.

CALENDAR FOR THE POULTRYMAN

Cut Out and Save This List of Hebrew and Legal Holidays for Rest of 1923, Which Affect Market for Poultry.

Holiday	Date	Best Market Days	Commodities in Demand
Jewish New Year...	Sep. 11	Sep. 5-8	Broilers, especially fat Fowls, Turkeys, Ducks and Geese
Day of Atonement...	Sep. 20	Sep. 17-18	All prime stock, especially White Leghorn Chickens and Roosters
Feast of Tabernacles.	Sep. 24	Sep. 18-21	Ducks, Fowls and fat Geese
Columbus Day.....	Oct. 12	Oct. 9-11	Live Chickens, Fowls and Rabbits
Thanksgiving Day..	Nov. 29	Nov. 22-28	Turkeys, Geese, Fowls Capons, Young Pigs and Rabbits
Feast of Law.....	Dec. 3	Nov. 28-30	Prime quality of all kinds.
Christmas Day.....	Dec. 25	Dec. 19-23	Turkeys, Geese, Fowls, Capons, Suckling Pigs, Live Rabbits, Live Goats
New Year.....	Jan. 1	Dec. 26-30	Turkeys, Geese, Fowls, Capons, Suckling Pigs, Live Rabbits, and Live Goats

for graded, standardized goods, by virtue of his standardization. Cars of the new Utah pack have already arrived and regular shipments from now on are predicted.

NEARBY WHITES IN DEMAND

The supply of nearby fancy white eggs was light last week and demand was good with receipts clearing rapidly at firm prices. Irregular quality and lower grades dragged unless offered at very low prices. It is believed in some quarters that there may be a late summer reduction in the egg supply which will have a tendency to put the market in good condition, regardless of the fact that August reports show an excess of reserves in storage.

Express shipments of good nearby henner eggs sold readily. Very fancy selected henner whites sold for 47c per doz. The best gathered and other grades in comparison sold slowly at much lower prices from 26 @ 37c per doz. Nearby medium quality eggs from 34 @ 40c.

HEAVY POULTRY IN DEMAND

Light stock poultry is giving ground to heavy varieties at lower prices.

small and mixed Leghorns, 27 @ 29c; old roosters, 16c; pigeons, pair, 30c; rabbits, 22 @ 23c.

BUTTER TONE STRONG

Most grades of creamery butter last week advanced one-half cent, due to light receipts. Creamery extras 92 score, were quoted August 2 at 42½c; Creamery, higher score than extras, 43 @ 43½c. Stocks of lower grades were quoted 35½ @ 36½c, with a good demand for the best at 37½c.

CHEESE LOWER

Last week part of the time the cheese market seemed to be standing still with the buyers on a vacation. Since prices in general were below the cost of much cheese stored, speculators began to buy. This activity caused a firmer feeling. New York State whole milk flats were quoted at 26 @ 26½c.

The markets throughout the country are lower.

DRESSED CALF SUPPLY LIGHT

Country-dressed veal calves did not arrive in large enough volume last week to hurt the market and the demand for choice was good. Lower grades sold

Quotations From Eastern Markets

The following are the prices at which farm products of special interest to eastern farmers sold on August 3:

Eggs, Nearbys (cents per dozen)	New York	Buffalo	Phila.
New Jersey henner whites uncandled, extras...	44 @ 47

BABY CHICKS

Barred Rocks, \$11.00; White and Brown Leghorns, \$9.00 per hundred; mixed, \$8.00. 100% delivery guaranteed. Not a new beginner.

J. W. KIRK, Box 51, McALISTERVILLE, PA.

600 White Leghorn Breeders, one year old, \$1.00 each. 10 Weeks' Old Pullets, Aug. 10th delivery, \$1.00 each and up. Thousands ready.
HUMMER'S POULTRY FARM
 FRENCHTOWN, N. J., R. 1

LARGE STOCK fine Poultry, Turkeys, Geese, Ducks, Guinea's, Bantams, Collies, Pigeons, Chicks, Stock, Eggs, low; catalog. **PIONEER FARMS, Telford, Pennsylvania.**

HILLPOT QUALITY CHICKS

Post Prepaid. Safe delivery guaranteed anywhere east of Mississippi River.

The Garden Berry Patch

Every Farm Should Have One—Some Suggestions

IT is a source of wonder to me that more farmers do not raise strawberries at least for their own use. They are so easy to raise and such a delicious addition to the menu. I have never yet seen the market where I live glutted with home grown fruit, though sometimes the fruit that is shipped in from outside markets does not sell well on account of its appearance.

There are different opinions as to the best methods to be followed in raising strawberries, but I think that most agree that thorough preparation of the ground is necessary at the beginning. We started in with 600 pedigree plants for our own use. Plants are like animals, you cannot start with scrub stock and expect to reap the cream of the market. After the ground was manured it was plowed, disked, and dragged both ways, which thoroughly pulverized the soil. It was then ready for the young plants.

Combine Varieties

We used both pistillate and staminate varieties, setting every third row of the staminate varieties. Staminate varieties do as well alone, but pistillate varieties have not as strong a power of pollenization, therefore do not produce much fruit when planted alone.

Being old-fashioned and not having many plants, we carried along a pail of water, pouring a little around each plant as it was put into the ground with the result that not a plant was lost. Of course this could not be done if one was raising for the market on a large scale. Some prefer to keep the plants in hills which was our method. The matted row is less labor to care for but does not produce as large or as fine berries.

For hill planting keep all runners clipped. Every time a runner is cut a new crown is formed on the parent stalk which means a larger production of berries. If runners are wanted for new settings, have a number of rows for the purpose of raising them, allowing two or three runners to each plant to take root but do not allow them to fruit. If too many runners are allowed to grow it weakens the vitality and if the vitality is weak of course the results are not up to standard.

If runners are kept cut the plants will produce a large crop of fine berries for two or three years, but for best results a new bed must be started every second or third year. The new bed will then be at its prime when the old bed is on the wane.

After the fruiting season the mulch should be burned just as it is in the row, for in this way many of the larvae of the white grubs which are so destructive may be killed.—IRENE ASHBAUGH.

HOW I HANDLE RASPBERRIES

C. H. CHESLEY

Red raspberries are not found in oversupply in any of our eastern markets. For this reason, I believe small farmers ought to give them more attention. A patch once started can be kept in shape by a little work each season and it does not need annual renewing as does the strawberry plantation. It may be said, in fact, that the raspberry patch renews itself. Of course the farmer uses judicious care in guiding the growth.

Red raspberries spread by suckers extending out from the roots, so no special methods of layering to help propagation are required. If it is desired to increase the plantation, the new canes are pulled up and set where wanted, either in the early spring or late fall. In order to keep the patch in shape, it is necessary to pull out these new shoots every spring, that is, those that appear between the rows. New shoots must be left each year, for a cane bears but once.

By A. A. READERS

I have found it advisable to go over the rows when the plants are in bloom or about done blooming and cut the new canes back to two feet or a little more. The new canes that do not bloom this year will perfect a crop of buds that will open up next spring, so I cut them back to cause a bushy growth and thereby cause a larger crop of buds. Then, when bearing is completed the old canes are removed and the new canes given the entire field. This treatment applies to the standard varieties that bear fruit in the early summer.

The everbearers, like the St. Regis variety, require a little different treatment. The canes seem to bear two crops of berries. Those which start early in the spring bear fruit in late summer and again the next spring. It may be said, however, that non-bearing canes should be cut back each spring in order to induce sturdy and branching growth. The reason some patches of everbearers do not bear much fruit is because canes are left too thick in the rows. As soon as a crop is matured, the canes should be removed. This gives the others a chance to develop and produce desirable berries. I have a patch of the St. Regis variety that has borne a good crop each year for five or six. If left to itself these bushes would have overgrown the entire garden. Instead I plow between the rows each spring and then I pull all shoots that are not desired to grow. This keeps the number of canes within bounds and I get berries in June and again during September.

The Brown Mouse

(Continued from page 95)

schoolroom. Bettina's eyes followed him about the room in a devotional sort of way; but so, too, did those of the ten-year-olds. He was loved, that was clear, by Bettina, Calista Simms and all the rest—an excellent thing in a school.

All the same, Jennie met Jim rather oftener after the curious conversation between those rather low fellows, Pete and the trouble shooter. As the time came for Jim to begin to think of his trip to Ames, Colonel Woodruff's hint that she should assume charge of the problem of Jim's clothes for the occasion, came more and more often to her mind. Could she approach the subject with any degree of safety? It was a delicate question; and considering the fact that Jennie had quite dismissed her old sweetheart from the list of eligibles—had never actually admitted him to it, in fact—they assumed great importance to her mind.

Somehow, Jim had been acquiring dignity and unapproachability. She must sidle up to the subject. She did. She took him into her runabout one day as he was striding toward town. "I'm going to Ames to hear your speech," said she.

"I'm glad of that," said Jim. "More of the farmers are going from this neighborhood than ever before."

"Who's going?" asked Jennie.

"The Bronsons, Con Bonner and Nils Hansen and Bettina," replied Jim. "That's all from our district—and Columbus Brown and probably others from near-by localities."

"I shall have to have some clothes," said Jennie.

Jim failed to respond to this, as clearly out of his field.

"And pa's going to have a suit before we go, too," said Jennie. "Here are some samples I got of Atkins, the tailor. Which would be the most becoming do you think?"

Jim looked the samples over carefully, but had little to say as to their adaptation to Colonel Woodruff's sartorial needs. Jennie laid great stress on the excellent quality of one or two samples, and carefully specified the prices of them. Jim exhibited no more than a languid and polite interest, and gave not the slightest symptom of ever having considered even remotely the contingency of having a tailor-made suit. Jennie sidled closer to the subject.

Vigor

Vigor is one of the most important characteristics of a dairy cow.

VIGOR IN HOLSTEINS MEANS --

Less trouble to the dairyman at calving time -- fewer losses from cows or injury to cows through calving -- stronger, healthier calves at birth -- more rapid gains in the offspring from calfhood to maturity -- large, steady production under adverse conditions.

EXTENSION SERVICE
 The Holstein-Friesian Association of America

Opportunity Calls from CANADA

Visit Canada this summer—see for yourself the opportunities which Canada offers to both labor and capital—rich, fertile, virgin prairie land, near railways and towns, at \$15 to \$20 an acre—long terms if desired. Wheat crops last year the biggest in history; dairying and hogs pay well; mixed farming rapidly increasing.

Homeseekers' Rates on Canadian Railroads

If you wish to look over the country with a view to taking up land get an order from the nearest Canadian Government Agent for special rates on Canadian railroads. Make this your summer outing—Canada welcomes tourists—no passports required—have a great trip and see with your own eyes the opportunities that await you.

The Woman Who Did What She Could—By Jared Van Wagenen, Jr.

Perhaps You Will Find the Answer Here

Mechanical Problems and Troubles of A. A. Readers Answered Briefly

An Ohio reader asks the following: "I would like to know if there is any kind of oil I could use for painting rough out-buildings besides linseed oil, something that would come cheaper. What is the name of such oil and where can I get it."

FISH oil has been used for this purpose either alone or mixed in varying proportions with linseed oil. The impression is, however, that in general the use of this oil is not satisfactory. Personally we would prefer to use linseed oil entirely even though it costs a little more.

* * *

Grounding a Metal Roof

I am contemplating rebuilding my barn. What bothers me most is what to use for the roof. Would you please give me your opinion about galvanized steel roofing? If properly grounded, will it take the place of lightning rods? What would be the proper way to ground it? It may interest some other readers of American Agriculturist if you should give a little article about it.—C. K., New York.

METAL roofs have in general, proven to be very satisfactory. But a metal roof in itself is no protection against lightning. It must be well grounded from at least two corners and preferably from four. Either lightning-rod points must be spaced along the ridge about twenty feet apart or a sharp edged or notched metal ridge-board must be placed on top of the ridge. If lightning-rod points are used, they must be connected with the roof, but need not be connected to the ground wires. Under no conditions should a round-ridge roll be used unless points are provided.

Ground connections for lightning conductors are of vital importance and must be properly made. These ground connections should extend down to permanent moisture. This depth, of course, will vary in different localities. In deep soils, in many locations eight feet is sufficient. In deep soils, a hole may be dug, drilled or driven the desired depth and the cable run down in it. In shallow soils the grounding is necessarily a little more elaborate. * * *

Engine Needs Reboring

I have a gasoline engine in which the cylinder is worn so it throws oil on the spark plug; new rings do not seem to help it. I would have it rebored and a larger piston put in, but a garage man tells me that the inside of every gasoline and automobile engine cylinder is case-hardened or glazed over to protect against wear, and by boring it it cuts this hard surface, and the cylinder will soon leak worse than ever. He said a better way is to use emery cloth and smooth or even up the cylinder in that way. Please let me know which would be the best, boring, emery cloth, or a new engine? The engine is otherwise in good condition.—H. G., New York.

WE are very much inclined to believe that your garage man is misinformed about the condition of the interior of the cylinder of a gasoline engine. We have never heard of the interior cylinder walls being case-hardened. It is true that sometimes due to long wear they become very highly polished and have a glazed appearance, and there may be some slight oxidation which causes a scale to develop somewhat harder than the metal itself, but of this we are doubtful.

When the cylinder of a gasoline engine becomes so badly worn that new rings carefully adjusted do not aid in the compression, then the only thing to do is to rebore the cylinder, putting in new oversize pistons. The amount of metal that must be removed will vary according to the amount of wear, but no more should be removed than is necessary. Sometimes this reboring is done on a lathe, or a special reamer may be used, particularly if the cylinder diameter is small. There are also grinding machines which will do this work, but this process is more expensive.

The method suggested by your garage

man; that is to use emery cloth is impractical. If you really want to get your cylinder put up in good shape, we would advise you to seek the services of some other mechanic, because judging from the misinformation which has been supplied by the one you have already consulted, he is not particularly safe to trust with a good piece of machinery.

* * *

Building a Concrete Reservoir

Please tell me what will be the cost of building a reservoir 10 x 10 x 8, walls 8 inches, top 6 inches thick? Do you think this thick enough? Cement 90 cents per hundred, sand and gravel cost nothing. Will twenty feet of fall be enough pressure for range boiler and other fittings? Would like you to tell me number of cubic feet of each material needed? —W. L., New York.

THE materials required for constructing a concrete reservoir 10 feet square and 8 feet deep with walls that taper from 8 inches to 6 inches at the top will be approximately as follows: 66 bags of cement 3.8 of a cubic yard of sand, and 3.4 of a cubic yard of pebbles or crushed stone. This is on the assumption that a 1-2-4 mixture will be used, which if properly handled will give good results.

A 20-foot fall should give you sufficient pressure to run water through the range boiler and other fittings. Each foot of elevation will give you a pressure of .434 pounds, so that even allowing for reduction because of friction, you will have 7 or 8 pounds pressure available. * * *

Timing the Valves and Spark

The crank shaft in our truck broke, causing the cam and crank shaft gears to get out of "time." We retimed them and set the breaker points to separate just after dead center on retard spark. In going up a hill on high, running the engine slow, it runs better on the advance spark than it did formerly on retard and it appears to have more power. How far ahead of dead center can the breaker points part before it causes the engine to kick back in cranking? —E. B., New York.

WHEN you retimed the motor you very likely got it just about right. This motor is timed so that the platinum points just break when the motor is slightly past top dead center. The greater the advance the better the engine will run up to a certain point. When advancing the spark too far the engine will kick back. However, it runs most economically when the spark is advanced as far as it will go without causing a pound.

To time the magneto, turn the engine over until number one piston is 1/32 inch past top dead center on the power stroke, retard the contact breaker and move the armature either to the right or left until the platinum points just break with the cylinder in this position. You will see that the power engine is not far past dead center if the piston is moved only 1/32 inch on the power stroke. Do not set the spark too near dead center on a high-speed motor. In some motors the spark occurs 45 degrees before the piston reaches dead center on the compression stroke. * * *

Determining Speed of Saw

How fast should the edge of a circular saw blade travel? What diameter saw would a 12-22 tractor handle to the best advantage?—E. H., New York.

THE average rim speed of a circular saw is about 9,000 feet per minute. The rim speed of a saw operated by steam feed may be increased to 12,000 feet per minute. To obtain the rim speed of a saw multiply the diameter in inches by 3.14 which will give the circumference, and divided by twelve will give the answer in feet, and multiply the figure obtained by the speed at which the saw

is operating; the answer is rim speed in feet per minute. For example, assume that we want to know the rim speed of a 20-inch saw, running at 1,800 R. P. M., multiply 20 by 3.14, divided by 12, equals 5.23, and this times 1,800, equals 9,414, which is the rim speed of the saw.

A 12-22 tractor ought to handle a 36 or 40-inch saw very easily. So far, there are no saw attachments on the market for this tractor.

To find the diameter of the driven pulley, knowing the diameter and revolutions of the driving or engine pulley, multiply the diameter of the driver by the number of revolutions, and dividing the product by the number of revolutions of the driver. Assume, for example, a 10-inch pulley on an engine running at 900 R. P. M., and the revolutions of your driver is to be 1,500, multiply 10 by 900, equals 9,000, and dividing this by 1,500 will give 6, which is the diameter of the driven pulley. * * *

Straightening Saw Mandrel

I have a 4-horsepower sawing rig on which the saw shaft is bent. Would the shaft keep its shape after being straightened? Would you advise getting a new shaft?—E. P., New York.

IT depends on how much a new mandrel for the saw would cost, whether it would be better to get a new one or have the old one straightened. Straightening a shaft is not a very difficult proposition, and if you have a good mechanic available and if the mandrel is not sprung too much, there is no reason why the straightening could not be accomplished without any trouble. But if the bend is very bad and there would be danger of cracking the mandrel in the straightening process, it would naturally be sensible to get a new mandrel. The best thing to do would be to write to the manufacturer of the saw and find out how much a new mandrel would cost and compare it with the estimate of straightening the old one. * * *

Water Wheel to Generate Current

I intend putting in a small water-power electric plant this summer. As a rule I have about fifty cubic feet of water flowing and can obtain fall enough to install about a seven-foot overshot wheel. I am making the wheel myself, and would like to know, with a two-foot head behind the wheel, about how many lights I could have and about how much power I would have? Would you advise putting in wide blades in the wheel? I am making it with three-foot buckets, that is, the wheel will be three feet wide. I am making it wide on account of having so much water, at certain times the creek will stay up for a week or two at a time.—H. H., New York.

IF the 50 cubic feet of water you mention is the amount that flows per minute, you will have power enough to make a very nice installation with your 7-foot wheel, and with a 2-foot head behind it, you should develop something pretty close to 3/4 H. P., or considering loss of power, the resulting efficiency of the wheel will give you not less than 1/2 H. P. This in itself will operate a generator large enough to give you current sufficient for a number of lights, and for small motors such as are included among the various items of equipment commonly used around the house, such as washing machines, churn, vacuum cleaner, etc.

If you want to include in your installation a storage battery, which of course will add something to the expense, you will have an even larger amount of current available at least part of the time. Whether this additional outlay of money will be profitable or not can only be determined by a careful analysis of your power requirements. It is advisable to make the wheel rather wide.

The Woman Who Did What She Could

A Tribute To All Those Women Who Live, Work and Sacrifice On the Land

WHAT I am about to write is not a story of the imagination. It is the truth—truth as simple and unadorned as any tale that can be told. It is not "sob sister stuff," for there is in it nothing of heart-breaking sorrow or rending suffering or cruel injustice. There are no high spots in it for it is the story of a very drab and uneventful life—but in just this lies its pathos. If it has human interests or a moral, it is only because it speaks of the quiet heroism of patience and resignation and the homely virtue of faithfulness in a round of very humble daily duties through many years.

The story came to me the other day under the seal of the confessional—told to me because I was the appraiser for the Federal Land Bank. I violate no confidence—I give no names or places on the map, but when these good people read this story as I am sure they will—if they chance to remember and note the details that exactly correspond with what they told to me, I can only assure them that I set it down in warmest sympathy and admiration and from a full heart.

The farm according to that ancient, quaint and surely true phrase of our deeds contains 105 acres "more or less," and it lies by the side of a much traveled State Road, and every day and more on Sundays and Holidays the world streams by in gay parade of cars of all degrees from battered flivvers to "sport" models of world-famous makes, used for the pleasures of a summer afternoon, but whose price is more than all the gross receipts from this farm for half a dozen years. So you see it does not fit the usual story setting of a "lonely, isolated farm."

Nor is the farm so poor as farms go. It is nearly level and free from stone and it has been tilled—perhaps not always wisely tilled—through many years. There is need of lime and phosphorus and drainage and legumes. The man knows all this but there is lack of labor, lack of money—most of all perhaps there is lack of youthful hopes and high enthusiasm. O—I grant that the farm needs only new blood and that skillful, energetic management would do wonderful things for the soil.

The man and his wife—already then no longer young, came here twenty-two years ago and began to make a home with some cash paid down and a mortgage for perhaps

By JARED VAN WAGENEN, JR.

two-thirds of the value of the farm. Twenty-two years of the best of their lives have been invested in their task. Always the interest and sometimes a little of the principal has been paid on the day it was due. Indeed they may boast that they are attaining success, for the debt is less than it was in the beginning, and they have made some improvements and the buildings are better than

"She had cared for the home, had made the butter, had fed the poultry, had performed the multitudinous tasks that only women know, and in times of need had helped with the work of the farm"

they were. The wife for nearly all those years has kept in very primitive fashion a book showing every penny of farm receipts. During two or three years the sum total has been less than \$600. One golden, long-to-be-remembered year—1919 I think—it rose above \$2,000 and affluence seemed close at hand, but last year again it sank dishearteningly low.

But always the margin between receipts and expenditures has been very narrow, so that the loss of a cow was a disaster to be reckoned with and the purchase of a few rolls of fencing meant a revision of the farm budget.

It was (as the corporations say) to "refund" their debt and thus secure more favorable interest rates and terms of payment that they sought the aid of the Land Bank.

Perhaps it is bad form or improper for an appraiser to accept the hospitality of a meal when to a certain extent his host's financial future depends upon his recommendation, but it was near dinner time and they were the type of folk who disclaimed all ability to do business until you had eaten with them. We sat in the farm kitchen at a table loaded

with most abundant, simple, wholesome food and there the woman outlined for me the uneventful, prosaic story of the years.

In one respect the dates had dealt hardly with them, and this was the only hint of tragedy in the recital, for the years had brought them no babies, and so the old house had never echoed to the voices of little children. We who are blessed with children can know and rejoice in that through them we attain a certain earthly immortality, but to

the childless when the end comes, in this world at least, it is like the blowing out of a candle or the breaking of a wave.

Nevertheless they had walked what must have sometimes been a lonely way with cheerfulness and on the whole content. The pathos of her story lay in this—that life had been so full of thronging labors, but had held for them so little of opportunity. There is a fine passage in Thomas Carlyle's "Sartor Resartus" in which that Scotsman cries: "It is not because of his toil that I lament for the poor," and then goes on to say that what he does lament over is that in the pressing struggle for daily bread "the lamp of his soul should go out," and this I take it is the danger in the long hours in the steel

mills, the danger in the fearfully long hours which sometimes comes to we folk of the farms.

The man, vigorous and rugged, carrying his years with ease, it seemed to me, has almost alone cared for the work outside. The woman had cared for the home, had made the butter, had fed the poultry, had performed the multitudinous tasks that only women know, and in addition in times of need, had helped with the work of the farm and fields. I cannot say that it had broken her physically or made her old before her time, but I do know that it had left her no time for reading, for recreation, for day-dreaming or for those pleasant idle tasks of dainty needlework that women love to do. Life had brought her so little. Now and then a trip of ten miles to the little city—their market town: once in a great while—three or four times in all a visit to the movies. How little she could tell of adventure or recreation! Yet in her talk was no note of repining, no note of discontent. So she goes on, year after year knowing that each winter

VOL. 112 August 18, 1923 No. 7

Ready For School?

IT will soon be time for the youngsters to go to school again. Unfortunately few of them look forward with any pleasure to the opening of the school year. This may be because folks are just naturally contrary or because the average school is not an interesting place to most children. However, getting an education is just about the most important job in life.

Thousands of boys and girls will decide this summer for one reason or another not to go to school any more. Every one of them will later in life regret that decision. We never have yet heard anyone say that they were sorry they had so much education, but on the other hand nearly every grown person regrets that they did not have or take more school advantages. If education was necessary in the past it will be more than ever necessary in the future. Competition between individuals is rapidly increasing. To meet that competition and to make a living one must be trained as never before.

But making a living is not the chief object in true education. For a training that fails to give its possessor more happiness than he otherwise would have is a failure. Happiness is the chief object in life, and true education should increase the possibilities of real happiness.

Few of us can give our children all that we wish in the way of material wealth and advantages. It is probably a good thing for the children that we cannot. But all of us can do much to help the young people to something which is worth more to the youngsters than actual dollars and cents and that is trained minds with which they can get the most out of life for themselves and their fellows.

"The King Is Dead"

A FEW weeks ago a hundred thousand people gathered in Jersey City to see the Firpo prize fight. When Willard, entered the ring, the crowd cheered and continued to cheer throughout the fight until he

began to show signs of distress. Then when he most needed their encouragement, they transferred their affections to the other man. When Willard was finally licked, the crowd hissed him and shouted their approval of the victor.

Every time we hear of something like this showing the heartlessness of the mob, we think of the Roman crowds two thousand years ago whose idea of a glorious holiday was to watch the lions eat the Christian martyrs. Shakespeare brings out the cruelty and fickleness of crowds in his "Julius Cæsar." He shows the mob out to celebrate a holiday in honor of Cæsar.

But, indeed, sir, we make holiday to see Cæsar and rejoice in his triumphs.

Then Cæsar is murdered on the Ides of March and after a speech by Brutus defending the act, the crowd loudly applauded the assassins.

Cæsar's better parts

Shall now be crown'd in Brutus.

cried the citizens. Then Mark Antony followed with that wonderful speech defending Cæsar which begins:

Friends, Romans, countrymen, lend me your ears;
I come to bury Cæsar, not to praise him.
The evil that men do lives after them,
The good is oft interred with their bones;
So let it be with Cæsar.

He was my friend, faithful and just to me;
But Brutus says he was ambitious,
And Brutus is an honorable man.

He hath brought many captives home to Rome,
Whose ransom did the general coffers fill!
Did this in Cæsar seem ambitious?
When that the poor have cried, Cæsar hath wept;
Ambition should be made of sterner stuff.
Yet Brutus says he was ambitious;
And Brutus is an honorable man.

Bear with me;

My heart is in the coffin there with Cæsar,
And I must pause till it come back to me.

But yesterday the word of Cæsar might
Have stood against the world; now lies he there,
And none so poor to do him reverence.

After this speech, from which these are only a few quotations, the mob switched their affections back to Cæsar and rushed forth to burn and pillage the houses of Cæsar's enemies.

Another expression voicing this same idea that has come down through the years is: "The King is dead; long live the King."

As individuals there is no doubt that we have progressed a long ways toward a higher plane in two thousand years, but when we get together in crowds and mobs, then we often show how thin the veneer of civilization is and how near to the surface lurks the primeval savage in all of us.

Our Protective Service Bureau

FOR a great many years, American Agriculturist has maintained a Protective Service Bureau to care for and protect the interests of its subscribers. We have had little to say about this special help for subscribers, preferring to let our works instead of our words speak for us. But in order to let all of our people know what this service is so that they can use it, we are giving here-with a brief summary of what has been done and what we can do.

During the month just completed—July, 1923—American Agriculturist collected \$1,097.45 for its subscribers. The most of this probably would have been lost otherwise. Our claims fall in two classes; those against our own advertisers, and those against non-advertisers. Owing to the careful check we keep on our advertising, claims against these advertisers are very few; and on the other hand, of course they are usually easier to settle in a satisfactory way. American Agriculturist refuses advertising constantly amounting to hundreds of dollars when our

investigations show that such advertising is not reliable.

During the past six months, ending August 1, our Protective Service Bureau handled 2,966 complaints, of which only ten per cent were about our own advertisers. Most of our cases are against commission merchants to whom subscribers have shipped their farm products. Many are against mail-order houses. Claims against mail-order houses are fairly easy to adjust because most of them are willing to take our word for it, and settle at once. There is more difficulty with the other houses and often a large amount of work has to be done in tracing express receipts, filling claims, etc. For this reason, the correspondence runs very high, each complaint involving many letters.

In addition to the above classes of service, we answer hundreds of financial, investment and legal inquiries, maintaining on our contributing staff a financial expert and a staff of lawyers, the best that money can hire.

One of the encouraging things about the work of the Protective Service Bureau is the hundreds of grateful letters which we receive from subscribers who have been helped. Naturally, when one receives his money in full on an account he had given up as lost, he appreciates the agency which got it for him.

It might be well to mention that there are certain types of cases which we cannot handle. These have to do with personal and family quarrels and difficulties between neighbors that cannot be straightened out except by someone on the ground. In such cases, we can only tell the subscriber to see a local lawyer. Where legal advice is necessary, we recommend a reputable lawyer near the inquirer's home.

If you are in trouble, write us and we may be able to help you out. The service is absolutely free of charge—just one of the many things which we are doing to help our people.

Grade Cattle at the Dairy Show

THE National Dairy Show is encouraging the owner of grade cows to make exhibits at the exposition to be held with the World's the exposition to be held with the World's Dairy Congress at Syracuse, October 5 to 13. This is good work. Cows do not necessarily have to be pure breds to be good; in fact, good grades are better than poor pure breds.

The Dairy Show Committees are getting in touch with the owners of grade cows through cow-testing associations and otherwise urging them to enter their good cows at the local county fairs. From these fairs, county herds will be made up for exhibition at the State fair, and from the State fair, herds selections can be made for the National Dairy Show. This does not mean, as we understand it, that one must go through all of these fairs in order to get his cattle into the National Dairy Show, but it is one means of insuring every dairyman who attends the Dairy Show the opportunity of studying an exhibit of grade cattle which cannot be equalled for quality the world over.

Definitions for Every Home

A "HIGH-JACKER" is one who steals a load of booze from an honest bootlegger! We understand that it is a growing and highly profitable business.

Ah! the things he might have said,
Quoting authors long since dead,
Some epigram appropriate—in rhyme.
Ah! the hit he might have made
And the scores he could have paid
If he'd only said the right thing at the time!
—ALBERT CHEVALIER, "The Orator's Lament."

Both Sides Have Their Say

On the Prohibition Vote, and That "Say" Makes Good Reading—Be Sure To Vote

WE are for anything that will make the world a happier, better place to live, and prohibition certainly has helped more people than any one other thing that man has done. When we think of all the crime, misery and suffering caused by drink, how can anyone wish it back?

I think the great majority of country people are in favor of the Eighteenth Amendment and of having it enforced more rigidly. We should not think of just ourselves if we do want to drink, but of the best thing for the people, especially the children.—J. S., Pennsylvania.

"MENTION SHOULD BE MADE OF CIDER"

ARE farm people for prohibition? Unfortunately many of them are not. That is, not strict prohibition. A. L. T. says: "If alcohol is such a terror to mankind, why has the Creator made it so plentiful?" Does the Creator have anything to do with the hidden stills? He also says: "A large majority of our citizens made outlaws." Have they been made outlaws? Or were they born outlaws, only needing the proper chance to develop their tendency?

A man who is adunkard now is not a law-abiding citizen! And A. L. T. says: "Any one can procure the drinks that has the price." And it looks very much like it was so; but, shall this continue to be so? If one law can be trampled under and ignored, cannot all others if the outlaws so wish it?

A constitution that passes a law should enforce it! And there can be no leniency about it. Light wines and beers that are intoxicating should not be allowed any more than whiskey, and special mention should be made of cider. Prohibition law should be enforced so strictly no one dare furnish any such drinks, and then it would probably cease to be a snake in the bed!—J. H. G., Pennsylvania.

ENFORCE THE BROOKS LAW

ENCLOSED find my vote also my neighbor's against the Eighteenth Amendment. It is positively no good. The American people will never stand for such laws. It is five times worse since prohibition came in than before.

I am sixty years old and I know young boys and girls drinking home-brew liquor that is not fit to drink, and older people that never drank before. Then there is the loss of revenue that we have to make up some other way. Our court calendar is crowded full here with liquor violators. The cost to enforce it must be great.

In my judgment from what I have seen since it came in, it is no good, and should be taken off the slate at once; and go back to the Brooks Law and enforce it. Then our country would be safe.—J. A. B., Pennsylvania.

NOT LAWFUL TO KILL OR STEAL

SEVENTY-FIVE per cent of the farmers in this town want prohibition. The argument that the law is violated is true of any of our laws. Killing and stealing are not done away with, yet who would have it lawful to kill or steal? Personal liberty is another argument by the "wets." The Apostle Paul says:

By A. A. READERS

"Take heed lest by any means this liberty of yours become a stumbling block to them that are weak."—G. F. S., New York.

ADVOCATES MODIFICATION

I AM pleased to note that one of my favorite periodicals is about to place before its readers a fair and impartial vote on this question of prohibition.

I have always been against prohibition, because in my opinion it is utterly un-American, against the spirit and letter of the very foundations on which the great American nation was built and now rests. The Eighteenth Amendment has become (as might easily have been foreseen) the plaything of crooks, grafters and hypocrites, both in and out of the Prohibition Party.

If there be those who enjoy a glass of beer or wine or even liquor in moderation, I say "Let them have it." And to those who would abuse this privilege, the law now is ample to deal with disorderly persons. And again, the immense sums now spent to support crooks and grafters would be turned into the treasury of the United States and unquestionably our taxes would be reduced to a great extent.—H. F. K., New Jersey.

AS AN EMPLOYER VIEWS IT

AS I send my copies to relatives near my farm in New York State, I do not want to mutilate my issue of July 7th by cutting out the form on Page 5. But if you care to register my opinion and judgment, it is unqualifiedly and unreservedly in favor of the rigid enforcement of both the Volstead and Narcotics Acts. I believe that only in their legitimate and intelligent use, under pro-

fessional direction for medical purposes, have liquors of any grade and drugs any proper place.

My judgment has been formed as a considerable employer familiar with both urban and rural conditions in many States. I believe if the general and indiscriminate use of liquors and drugs could be stopped the result, probably not apparent for a generation, would prove to be the greatest blessing the American people have ever enjoyed, or ever will.—W. B. Y., New Jersey.

DANGEROUS FOR AUTOMOBILISTS

IN this section the farmers are largely in favor of prohibition, especially the prosperous ones. Since the enforcement of the prohibition laws has been left to the Federal authorities, the bootleggers and liquor sellers have become very bold in their disregard for law, and much to the discomfort and danger of those driving automobiles when meeting an intoxicated driver at any time.—L. H. B., New York.

BETTER FOR THE RACE

I OPPOSED adding the Eighteenth Amendment to the Constitution because I did not believe that under our form of government it could be made to accomplish its object. I believe, however, that it would be better for the human race if all the alcoholic liquors intended for drinking purposes were thrown into the sea, and the knowledge of their manufacture become a lost art. It would be better for humans, although bad for the fish. The Volstead Law has multiplied the number of distilleries far beyond what I imagined would be the result of the attempt to enforce the amendment by suitable legislation. Prior to this great wholesale attempt to make people temperate by law, where there was one distillery under strict supervision, there are perhaps ten thousand small stills owned by the more lawless element of our population, turning out a product that is deadly in its effects on the human anatomy, and pays no tax while it collects an enormous tax from the consumer.—S. N., New Jersey.

WIPE IT OFF THE BOOKS

I AM sorry that I cannot vote on either question in your so-called "Prohibition Ballot." While I certainly am for the strict enforcement of every law legally enacted, I will not stultify myself by asking for the enforcement of a law which has no place on the statute books of any free and enlightened nation of the present day.

As to the second question. The only modification I am for, is the wiping off of this amendment forever from the Constitution. It is not a question of whether we shall have liquor or not. It is a question of whether we shall have liberty or not. I object to you or any other unauthorized person stating that the farmers, or 85 or 95 per cent of them, or any other per cent, are in favor of, or opposed to any law. Only the "lunatic fringe" on either side of any question ever takes "pen in hand" to express themselves which is why I hated like H—I to write this letter.—H. K. H., Pennsylvania.

PROHIBITION BALLOT

OF THE

AMERICAN AGRICULTURIST

Are You for the Strict Enforcement of the 18th Amendment as It Now Stands? ☐ YES ☐ NO

Are You for a Modification of the 18th Amendment to Permit Light Wines and Beer? ☐ YES ☐ NO

Designate your opinion by placing an X in the square opposite Yes or No on each question. Sign your name and address. Your name will be kept strictly confidential.

Name.....

Address.....

Why You Should Vote

Do the American people want prohibition? The Wets emphatically say "No" and the Drys are even more emphatically for it. Both sides claim a majority. Which is right? What do farm people think about it? The opinions of farmers on any problem, if they will express them, go far in determining the outcome of a controversy.

American Agriculturist is taking a vote of farm families on the question of prohibition. It is a vital issue and whether you are for it or against it, be sure to vote in the spaces above. Mail this ballot to the American Agriculturist, 461 Fourth Avenue, New York City.

How To Construct A Septic Tank

A System for the Disposal of Kitchen and Household Wastes

By F. G. BEHREND

WITH the installation of a system supplying running water in the bathroom and kitchen, there arises the necessity of disposing of the water and the wastes. For this purpose either a cesspool or a septic tank, depending on conditions, should be constructed.

The Cesspool

The cesspool is somewhat cheaper and easier to make than a septic tank. It may be safely used where the soil is sufficiently loose and open to insure adequate drainage through the loose stone walls, and where the relative locations of the cesspool and the source of water supply are such that there is no possible danger of flow from the cesspool to the drinking water. This cesspool seepage may travel for a very considerable distance through loose gravel, cracks in shale rock, or openings in limestone formations, and therefore a drilled well cased down to the surface of limestone or shale rock is not necessarily safe. A cesspool dug in soil, not sufficiently open, will eventually clog and overflow, often necessitating the construction of a new cesspool.

The Septic Tank*

The septic tank is a chamber, simple in construction and not large, generally made of concrete, water-tight, and so arranged as to bring about as completely as possible the decomposition of the solids in bathroom and kitchen wastes. A septic tank must be supplied with a suitable disposal system of drain tile to take care of the flow of waste water from the tank. This disposal system is described later. While the action of the septic tank will turn to liquid part of the solids entering, it should not be expected that there will be no accumulation whatsoever in the septic tank. In fact, the tank should be properly cleaned at least once in every five to ten years. As shown in figure (drawing sent under separate cover B) this type of tank is, on the inside, 4 feet 6 inches deep, and 3 or 4 feet wide, and from 6 to 8 feet long, depending upon the number of people in the family. It is made of concrete poured around a single form as simple as that used for making any other single-chamber tank. Each side of this form carries two vertical beveled strips of wood which leave grooves on the inside walls of the finished tank, and in these grooves short lengths of plank are placed to form partial divisions in the tank. The purpose of these is to cause the solids to settle, to aid the bacterial action, and to prevent the solids from escaping through the outlet.

The inlet and outlet passages are through four-inch, vitrified, Y-branch, sewer-pipe fittings, easily obtainable and very simply installed in the tank.

INSIDE DIMENSIONS OF TYPE "Y" SEPTIC TANK

Number of Persons	Inside Width Feet	Inside Length Feet
Six or less.....	3	6
Eight.....	3	7
Ten.....	3	8
Twelve.....	4	8

The upper branch of the intake Y is plugged so that the sewage must enter the tank through the lower opening. In case the sewer pipe between the house and the septic tank becomes clogged, this plug can be removed and

a cleaner forced through the pipe to the running trap. If an elbow-fitting were used instead of the Y, this cleaning operation would be much more difficult. The four-inch vitrified Y used for the outlet is placed one and one-half inches lower than the inlet Y. With the exception of a small hole for a vent, the upper part of the outlet Y is closed and the liquid from the tank is made to pass out through the branch opening.

Connection with the House Drain

Four-inch bell-and-spigot vitrified tile are laid from the house to the tank and the joints are made tight with oakum and cement. A grade of one-eighth inch a foot is permissible, one-quarter inch a foot is desirable, while more than three-quarter inch a foot is not recommended, since too steep a

grade will produce a velocity that will cause an excessive agitation of the contents of the tank.

Connection with the Disposal Tile

Overflow from the outlet pipe of septic tanks is best distributed evenly through a large area of surface soil by allowing the liquid to soak away from numerous joints between the lengths of one or more runs of ordinary farm drain tile laid underground not far below the surface. Disease bacteria, if any are present in the bathroom wastes, will be in part destroyed during the rotting process in the septic tank; but many are sure to flow from the tank into the distributing tile. From the tile the bacteria are carried, by very slight movements of the water, out among the adjacent soil particles, to which they will at once adhere; and since the conditions in the soil are very different from those in which the disease bacteria thrive, they will soon die and the danger from them will be removed. The action of the air and the bacteria always existing in surface soils will, if the distributing tile are properly installed, keep the soil open and fresh, by the processes of nature, for an indefinite period.

Locating the Septic Tank and Disposal Area

Neither the septic tank nor the disposal area can be exactly located until a number of factors have been carefully considered. Certain definite requirements must be met, and as the topography, type of soil, and the size of the area available for each installation vary, the tank and the disposal area must be so located as to meet existing conditions and the requirements necessary for successful operation.

Factors to consider:

1. There is not much danger from

seepage from either the septic tank or the disposal tile, if the tank is carefully and well built and the absorption area is properly located. Locate the absorption area where neither the slope of the ground nor the direction of seepage is toward the source of water supply. If so located, no contamination should result if in fairly heavy soils the tile are laid seventy-five feet away from the water supply. For lighter soils lay the tile at a distance of 150 to 300 feet from the water supply.

2. The inlet sewer should be about two feet below the surface, at the most shallow point. Sewage will not freeze in the sewer pipe at this depth, if carefully laid to grade so that there are no sags in which the sewage can collect.

3. The inlet sewer should have a grade of not less than one-eighth inch to the foot. A grade less than that will decrease the velocity of the sewage and thus tend to settle out the solids which, in turn, may fill the sewer pipe; a grade as steep as three-quarters of an inch to the foot is also undesirable. If a steep grade is unavoidable, place the septic tank near the house if possible, and let the steep slope follow, rather than precede, the tank.

4. The septic tank should be protected by a covering of earth sufficient to maintain vegetation. A depth of about twelve inches is usually satisfactory. In level ground, this will place the outlet sewer pipe, at the tank, about twenty-seven inches below the surface of the ground.

5. It is desirable to have the disposal tile within twelve to eighteen inches of the surface, therefore, the absorption area should, if possible, be at a level at least one foot below the proposed location of the septic tank. If the ground is fairly level, this may require locating the absorption area at some distance from the septic tank, or placing the tile at a greater depth and in greater number to compensate for this greater depth.

6. The septic tank may be placed quite near the house or at some distance from it, depending on the area available for the disposal plant and on the lay of the land. It is possible, however, to place it too near the house, for if the sewage enters with a rush, the contents will be stirred up, and this agitation retards the septic action. It is better, therefore, to have twenty-five to fifty feet of sewer pipe between the house and the septic tank.

7. The size and irregularity of the ground of the plot available for the absorption area, as well as the nature of the soil, must also be considered. The tile can be located either near the septic tank or at a considerable distance from it. In a soil containing much sand or gravel, ten to twenty feet of absorption tile per person will be required, while in a loam, thirty to fifty feet is necessary. Where more than one row of tile is needed, the rows should preferably be at least six feet apart, and better results would be obtained by leaving a space of ten feet between them. Disposal tile may be placed in a hillside if they are laid in rows nearly parallel along the slope. The disposal tile, in porous soils, should have a grade of one-sixteenth to one-eighth inch to the foot, and in less porous soils, one-thirty-second to one-sixteenth of an inch to the foot. Only in exceptional cases should a line of tile be more than one hundred feet long. If two or more lines of tile are needed, they should be approximately the same length and neither over one hundred feet long. As has been stated, the tile should be within twelve to eighteen inches of the surface of the ground. The area should not be shaded, nor should the tile be laid near willows or poplars, as the roots of these trees may soon fill the tile.

The Woman Who Did What She Could

(Continued from page 103)

gone before—and Lo: the Night cometh!

Two thousand years ago in the palmy days of pagan Rome, they buried a Roman woman in a cemetery outside the city walls. Was she sister or daughter or sweetheart or wife we can never know. But he who sorrowed for her set above her for epitaph, one simple phrase whose magic makes her still young, and human, and warm, and lovely after twenty centuries, "She Whom Many Loved."

Then I thought of her and of other women; women of a type very foreign to this farm woman and to me; women such as I have glimpsed now and then just for a moment as they passed, sometimes almost insolently at ease in the crowded lobby of a great hotel, sometimes in the snug security of rushing Pullman trains; women with the air and carriage of queens being handed on winter nights from purring limousines into the dazzling patch of radiance that lies about the playhouse doors; these women in filmy lace, and satin, and furs and jewels, with wonderful cloaks thrown about them, concealing the great purple bunch of violets at their breast; women strolling across velvet golf courses cool and fresh and dainty of an autumn morning. Parasitic women these who "toil not, neither do they spin"; women who "have but fed on the roses and lain in the lilies of life"; women with soft hands and beautiful pampered bodies—sometimes too soft, and indolent and selfish, they tell me, to even suckle the children that they bear—I wonder—are they really "sisters under their skins" to my woman of the farm to whom the years have brought so little of leisure or opportunity. Then I remember another woman—a woman of Syria long ago whose life, I think, was narrow and circumscribed and bound about and concerning whom One made a phrase—a gentle phrase of kindly approval that still goes whispering down across the centuries, "She hath done what she could."

Well—every tale should have an ending, and so has mine. I have before me the report of the executive committee of the bank and these good folks will get their loan—the full amount they asked—and thereby the future will be a little more secure and freer of trouble than before.

I can only hope that the years that wait for them may bring to them a little more of kindly, pleasant things than has the past.

THE OPPORTUNITY OF DAIRY SECTIONS

"Now is the time for all good dairy States to come to the front with an exhibit typical of their section of the country"—is the opinion of W. E. Skinner, Manager of the National Dairy Exposition to be held October 5-13, at the New York State Fair Grounds, in Syracuse.

New York State has taken the lead, and appropriated \$10,000 to put on an exhibit exemplifying dairying as practiced in New York State. States as far west as Wisconsin and Washington are bringing exhibits across the continent, the nature of which have not been disclosed.

Ohio will make a display of its Swiss Cheese industry in an extensive exhibit and there will be large exhibits of buttermaking from leading butter States. The United States Department of Agriculture will set up an elaborate \$30,000 exhibit showing "Dairying of the Past" and "Dairying of the Present," which is destined to be a classic in the field.

Each State is making an effort to put on an exhibit typical of the State, that each may compare ways and means, and exchange ideas of practical value. Every farmer goes to the Exposition with the idea of bringing back something he can put into use on the farm.

It is the aim of Manager W. E. Skinner, who has been promoting dairy shows for the past ten years, to make this seventeenth one a more "Practical Exposition" than has ever before been held.

McCormick,
Deering, and
Milwaukee
Corn Binders

One of These Modern Corn Binders Will Help You This Year

If your corn binder is past the possibility of safe repairing, you will do well to talk to your McCormick-Deering dealer about a new machine for this year's corn harvest.

McCormick and Milwaukee Corn Binders are very popular among men who prefer upright binding, whereas the Deering is equally popular among farmers who would rather have the bundles tied lying flat. All three machines are well made, thoroughly efficient, and light of draft. You assure yourself a successful corn harvest when you take home one of these good corn binders.

McCormick-Deering Ensilage Cutters

Built in five sizes. Capacities 3 to 25 tons of cut fodder an hour. All sizes have reliable safety devices, force-feed, large throat, and heavy, large-capacity flywheels of boiler plate steel. Horsepower required ranges from 6 to 25 h. p. Consult your McCormick-Deering dealer. He will show you any piece of McCormick-Deering corn harvesting equipment.

BEFORE YOU BUY A WINDMILL

Carefully consider the following facts: A year's supply of oil is sent with every Aermotor. The Auto-oiled Aermotor is the Genuine Self-oiling Windmill, with every moving part fully and constantly oiled.

The Auto-oiled Aermotor has behind it 8 years of wonderful success. It is not an experiment. The double gears run in oil in a tightly enclosed gear case. They are always flooded with oil and are protected from dust and sleet. Oil an Aermotor once a year and it is always oiled. It never makes a squeak.

You do not have to try an experiment to get a windmill which will run a year with one oiling. The Auto-oiled Aermotor is a tried and perfected machine. Our large factory and our superior equipment enable us to produce economically and accurately. Every purchaser of an Aermotor gets the benefit from quantity production. The Auto-oiled Aermotor is so thoroughly oiled that it runs in the lightest breeze. It gives more service for the money invested than any other piece of machinery on the farm. The Aermotor is made by a responsible company which has been specializing in steel windmills for more than 30 years.

F.W. Millier Host of New York Beekeepers

New York County Notes

THE Empire State Federation of Beekeepers' Association held its annual summer meeting and picnic on Friday, August 3, at the home of Mr. F. W. Millier, Mottville, Onondaga County. It was a real old-fashioned get-together for beekeepers, their families and friends. In spite of the warm weather about 400 people were there from all over New York State, some from Pennsylvania, and a few from other States.

There was a feeling of optimism among the honey producers as to the crop and market outlook for this year. New York State promises to have an exceptionally good crop of honey, whereas practically all other parts of the country are reported to be very short. The quality of the New York honey, of which many beekeepers brought samples, is so far excellent.

The most interesting feature of this summer meeting was the contest arranged by Mr. R. B. Wilson, Extension Specialist in Apiculture of the State

College of Agriculture at Cornell. Mr. Wilson, who has succeeded George H. Rea in that position, has been the first to introduce these contests at beekeepers' meetings in New York State and they have proven very instructive. The contest in the use of smokers was won by Roger Lane, Trumansburg, N. Y. All those entering the contest were required to place their fuel, matches, and smokers on the ground and to start at a given signal to light the fuel to prepare the smokers. The winner was the one who had the largest volume of cool smoke at the end of half an hour. Mr. Lane used burlap dipped in saltpeter solution as fuel. Mr. Brownie Coggeshall of Groton, N. Y., won the first prize for skill in handling bees. Mr. Harry Beaver of Troy, Pa., won the first prize for the best five-pound honey container with his own lithographed pail. The contest for the best labor-saving device for use of beekeepers was won by F. W. Millier, Mottville, N. Y., for a specially constructed knife for the cleaning of sections. Mr. Millier also won the first prize for the best comb drawn out from a sheet of Dadants foundation. The prizes awarded to the winners of these contests were donated by beekeepers' supply houses and others interested in the honey industry.

The program included addresses by the following: J. B. Howe, Sacketts Harbor, N. Y., president of the Federation; George H. Rea, service representative of the A. I. Root Company, Medina, Ohio; Kenneth Hawkins of G. B. Lewis Bee Supply Company, Watertown, Wis.; R. B. Wilson, State College of Agriculture; W. J. Birdsall, New York State Department of Farms and Markets. S. B. House of Camillus, N. Y., made a report for the Committee on market conditions and prices.

For several years the beekeepers' cooperative associations of New York State have been discussing the possibilities of cooperative marketing of their honey and last year the Empire State Honey Marketing Cooperative Association was formed for this purpose. So far, however, the original plan has not been put into operation, but there was a great deal of discussion of the subject at the State Picnic. Mr. Birdsall of the Department of Farms and Markets, outlined clearly to the beekeepers the procedure that they could follow in putting their marketing organization into working order and it was a general consensus of opinion that this would be a generally good year to start with

some kind of pooling of surplus honey for wholesale sales. Any such pooling plan should, in the opinion of most of those who discussed the subject at the picnic, allow for local consumption.

The opportunity offered the beekeepers to advertise New York State honey through exhibit at the Eastern Apple Exposition and Fruit Show was pointed out by Mr. R. B. Wilson. Under the direction of Mr. Wilson, the Federation is planning to put on the largest and most instructive honey exhibit ever shown in New York State at this exposition to be held at the Grand Central Palace, New York City, November 3 to 10.

NEW YORK COUNTY NOTES

Schenectady Co.—The dry weather has affected all crops, probably oats more than any other. Potatoes are very much in need of rain. Rye is a good crop. The hay crop is about 80

Beekeepers inspecting the home apiary of F. W. Millier, Mottville, Onondaga County, N. Y.

per cent normal. New seedings are better than old meadows. Much hay will not be good on account of shortage of help. Many meadows will be pastured. Not a great deal of buckwheat was sown this year. Corn acreage is about normal.—S. W. C.

In Western New York

Allegheny Co.—Farmers are harvesting wheat, which made a very good crop in this section this year. Oats are also good. Hay made a good average crop. Most farmers are finished with hay harvest. There is a large crop of beans this year which looks fairly well. There were not as many potatoes planted as usual, but they are looking very good. The dairy farmers are doing well in this section this year. Most of them are selling their milk through the Dairymen's League. The League has put up a big plant here, which markets all the farmers' milk. It is hauled to the factory on motor trucks. Help is very scarce and wages are high, much higher than farmers can afford to pay. There will be a small crop put in next year, according to what farmers are planning now.—F. E. B.

Genesee Co.—Since writing my last letter we have had two severe thunderstorms; one was accompanied by some hail which did some damage. We also had one heavy windstorm. Wheat is mostly all cut and barley is about ready. With wheat at 90c a bushel, the farmers are surely up against it, especially when they have to pay \$5 a day for help. Hay made a good crop this year and oats are also looking good. The fruit in Genesee County is little over half a crop this year. Apples, all varieties, run about 55 per cent; pears, 45 per cent; peaches, 60 per cent. Butter is bringing 50c per pound, eggs 28c a dozen.—J. C.

Erie Co.—Farmers are all busy haying, which made a good crop. Corn is doing well. Winter wheat made a light crop. Many farmers are leaving their farms and working in Buffalo.

Farming is not paying in this section as products find little sale at any price at all. Furthermore, help is very scarce. Eggs are 25c; butter, 50c.

Ontario Co.—We are having fine harvesting in this section. All crops look well. Some corn is small, but is coming on well. Most of the wheat is in the barn, oats are almost ripe. Some barley cut and a lot of cabbage planted. Most all looking well.—H. D. S.

In Central New York

Broome Co.—The drought, which has been the most severe in years, was broken recently by an all-night rain. Crops have been suffering severely on account of the dry weather and consequently are not up to normal. Potatoes are scarce. New potatoes have been growing very slowly. Garden truck and fruit of all kinds are finding a ready market in Binghamton and Johnson City. Very few early chicks were hatched this year. The price of eggs is steadily advancing and many

predict that eggs will be the highest for this fall and winter. Some oats which were sown early are ready to cut. Prices at Johnson City market are as follows: Eggs, 33c; butter, 44c; live broilers, 40c; fowls, 30c; potatoes, 60c a peck; peas, 8 to 12c a quart. Several farmers have been selling day-old ducks on the Johnson City market for 30c each.—MRS. E. M. C.

Tioga Co.—Farmers are very busy getting in hay and harvesting wheat. The yield of hay is not up to normal as the season was late and also

very dry. We have had occasional showers, but none were sufficient to soak the soil for any length of time. On dirt roads the dust is dreadful when automobiles pass. During the past week or two, corn and other crops have grown amazingly as we have had all those heavy rains on the 21st and 22nd. Even then there was not enough. Many farmers in the neighborhood are seriously handicapped through lack of water, both for home use and for stock. Cherries, currants and gooseberries were abundant this year. However, raspberries suffered on account of the dry weather. Apples and pears promise a short crop, but peaches are fairly heavy. Peaches are dropping rapidly now, so we cannot tell what the outcome will be. Prices of farm products remain exceedingly low, while those things the farmer has to purchase seem to soar sky-high in price.—D. B.

Cortland Co.—Most farmers have finished haying in spite of the extreme shortage of labor. Hay made a fairly good crop in this county this year. Cabbage and corn are doing well, but need considerably more rain. The weather has been too dry for oats, leaving the crop short in straw. The crop will be light. Oats harvest will begin earlier than usual, due to the fact that the dry weather has matured them rapidly. Potatoes are growing very slowly, due to the dry weather.—G. A. B.

During the excessive heat period of weather many horses die from being overheated. A good plan that I have followed for a number of years is to wash the horses when coming in from work. The water should not be too cold, just a bit warm. This can be used with a good sized sponge in removing dirt, sweat and gum from the horse's body. Many a horse's life has been saved by this simple treatment, and requires but very little time. Ground oats are a much cooler feed in summer than corn, and makes the horse strong and vigorous.—PETER WILEY, JR.

General Motors Trucks

*"GMC Trucks Are
Seven Steps Ahead"*

Why Farmers Can Buy GMC Trucks At Such A Low Price

Because of the remarkably low prices at which GMC trucks are sold—when compared dollar for dollar with the quality of each part, and with the completeness of every detail of their equipment—farmers invariably ask:

"How is it possible to build and sell GMC quality at such a reasonable list price?"

There are two reasons why.

First, because GMC trucks are built by the General Motors Truck Company, a unit of the General Motors Corporation.

Second, because of the way in which the list price of GMC trucks is established and the basis upon which they are sold.

As a part of the largest automotive concern in the world, the builders of GMC trucks are able to make economies of purchase,

savings of manufacture and of general overhead expenses, not possible in a smaller organization. The actual cost of manufacturing a GMC truck is unquestionably the lowest that can be obtained.

To this cost is added a fair manufacturer's profit—no more. This new figure becomes the list price. There are no "extras" in the GMC selling price. There is no margin for meeting competition—there never has been.

But not only on account of their remarkably low price—but equally because of their complete dependability, and power, accessibility, numerous refinements and low operating cost—GMC trucks have come to be preferred by farmers everywhere.

Ask for our catalogue "Motor Trucks on the Farm".

Give a thought to Advertising

WE received the surprise of our life one day about a year ago when we met Betty Jones on Broadway and she told us that she was now Mrs. John Smith, having married a prosperous up-State farmer.

It wasn't her being married that surprised us, because Betty had been one of the prettiest girls we had known in our more youthful days before we became snared in the meshes of advertising. And the fact that a farmer had married her proved what good taste farmers have.

What caused us to wonder, however, was that Betty had married a farmer—not that she had ever had anything against farmers as such—but we distinctly remembered how Betty loved every modern convenience and of hearing her declare that she would never move away from the big city. Also we recalled her having expressed herself as so sorry for girls in the country because they had to live without any of the conveniences of city life.

Of course we didn't express our surprise to her, merely asking how she liked life in the country.

She was enthusiastic and ended by asking us to visit her the next time we were in the vicinity of the Smith farm.

About six months after that we happened to be up State and only a few miles from where the Smiths lived. We called, and were asked to spend the week-end. Of course, we had learned by this time through much traveling, that farmers were living just as well if not better than city people, but even so we were surprised by the completeness of the Smith place. They had almost every convenience that we enjoy in the city. Whatever was lacking was more than made up by the great advantage of being out in the country.

We spoke to Betty about her youthful prejudices against farms and she admitted that it had been a distinct surprise to her to find everything so up to date. And she said that their farm was no exception as all the neighbors had equally comfortable places. When we asked her how she managed to find time to get to the big city to do her shopping, she laughed.

"Why," she explained, "I don't have to go to the city to do my shopping. Of course a good many years ago if a farmer's wife wanted anything in the way of modern conveniences she had to, but now, with all the advertising in the farm papers and other periodicals we subscribe to, I can choose just what I want from them. And then all I have to do is go to the store in our little town and if they haven't got what I want they order it from the manufacturer whose advertisement I have read."

We didn't answer that, but we smiled a little. Because it did our heart good to hear this admission from a farmer's wife of the big part advertising was playing in making life better and happier on the farms of the country. We'd known it all along, because that's our business. But it was good to hear it from her lips just the same.

Advertising Manager

Points I Look For When I Buy Cows

The Head, Body, Flank and Veins Have a Bearing on Production

By H. E. BABCOCK

FOR as long a time as I have written about cows I have wished that I had available pictures to which I might refer to illustrate characteristics which it is almost impossible to describe. Accordingly the other day I arranged with Mr. Earl Flansburg who, though an amateur, is a splendid

only three years old. She has but three quarters. Yet, in six months she has given us over 9,000 lbs. of milk, as much as even a good Holstein gives in a year, and Mary is a Guernsey. Her producing ability is evident to me in her nostrils.

Note their size and how clearly defined they are. I never saw a good cow with a small nostril. I actually believe I could pick good producers in nine cases out of ten if I could see nothing but their noses. Lady Mary's head, however, shows other characteristics which go with high production. It is a feminine head. It shows what we call breeding. The expression is comfortably alert, not nervously so.

King Belle's Baldeen, a 20,000-pound prospect. Note what Mr. Babcock says about her flanks

photographer, to spend two or three hours at the farm and take pictures of some of our better cows.

These pictures, part of which are reproduced in connection with this article, I hope will enable me to make some points which I might otherwise fail to bring out clearly.

Veining and Udder Quality

Even the rankest amateur looks first at the udder of a dairy cow when passing judgment upon her, so we will first refer to the picture of Elmroad Lady Rilma. Stop a minute and look at her udder and milk veins. All things considered this cow is probably the best producer we own and will, I believe, make a record which will place her among the very highest Guernsey producers of all time. In fact, we hope to get around 20,000 lbs. and two calves from her in one year.

Look just back of her foreleg and note the extensions of the big milk vein. Sometimes we hear these spoken of as stanchion veins; I presume because they run toward the stanchions. Follow them back and you can almost see two milk wells, one where the big milk vein enters the body and the other just slightly ahead of it where an extension enters it. From the milk well an enormous twisting milk vein extends back to the udder.

Lady Rilma is a young cow, yet her milk veins are already well developed. I do not need to point out the size of them; the picture brings this out better than words can describe it.

Coming to the udder, you can almost see the silky texture. It is the type of udder which, when milked out, hangs limp and empty. To my mind it illustrates the kind of an udder which almost always goes with high production. In fact, taken altogether, the veining and udder of Lady Rilma constitute my ideal of the mammary system in a cow and furnish me with a measuring stick which I apply to all other cows.

Along with the udder and milk veins of a cow, I always note the head at my first glance. Lady Mary of Sunny-gables furnishes me the ideal I use in judging heads. It is good enough for a cover cut to the American Agriculture where you will find it. Lady Mary is

Just a glance at it and you feel like putting your arm around her neck. Now take her picture and contrast it with a narrow, mean looking head and you will get an idea of dairy temperament, that elusive yet essential quality in a dairy cow, so hard to define yet so necessary to recognize if you are to pick the good ones.

Probably no characteristic in a dairy cow has claimed so much attention as the rump. Breeders everywhere are looking for bulls that will sire cows

system and swing it under Baldeen's rump and put Lady Mary's head on the front end. Still I wouldn't have a cow, for I would have no middle. Anyway, the stunt is impossible, so to get an idea of a good head, a good rump, and a good udder joined by the kind of a middle I like to see, I have chosen the picture of fourteen year old Margaret Black. Margaret is giving us over fifty pounds of milk a day testing 5 per cent. Although fourteen years old, she looks good for years. Margaret has the fine textured udder, the large milk veins, the long and wide rump, a head with great open nostrils and alert eyes and, what is most important of all, a tremendous chest and a great deep middle. A dairy cow needs a deep chest and a big middle. They constitute her power plant.

That these characteristics taken together count for production is proven by Margaret's production figures. That the great chest and deep middle give the constitution which means long and profitable service is evidenced by the fact that this cow has produced milk and calves for twelve long years and I believe is good for another six.

In fact, Margaret so well typifies what I look for in a really profitable cow that we have chosen her to be the grand dam of our future herd sire. Have we made a mistake?

INDICATIONS OF COWPOX

I have a cow that has swellings on all four quarters of her udder. These swellings are nothing more than pimples that have small hard scabs. I have tried several remedies and am now using carbolated vaseline, but nothing seems to help. I am of the opinion that it may be cowpox. I have never had anything like it before in my herd. I would greatly appreciate your opinion?—A. S., New York.

You are right in your diagnosis of the case, at least from your description of it. Cowpox is a contagious disease that affects the udder and teats. It is apparently due to a filterable virus, which is closely related to human smallpox virus. It takes from four to seven days for the disease to develop. A little fever then becomes apparent, and mild general symptoms of a slight disorder or illness prevail. Shortly there will appear a few nodules on the udder and teats, usually smaller than the size of a pea. In a day or two these change to blisters, which contain a thin, clear fluid. In eight or ten days the centers of these blisters become depressed and contain pus. A dry scab gradually forms. It falls later on, leaving a typical pitted scar. The sores heal nicely unless injured in milking. Small, slow-healing ulcers may be caused in this way. Little treatment is necessary beyond very careful milking. Careful handling and the administration of vaseline or lanoline should prove very beneficial.

Elmroad Lady Rilma, showing her excellent mammary development

with long, level, wide rumps. *Slopers are taboo everywhere.*

For an illustration of what I like myself, I have chosen the picture of King Bell's Baldeen. Stop and look at her picture. Note the extreme length of her rump, how level it is and how wide. Then note her udder; see how well balanced it is, how it carries ahead and extends well up in the rear. Level rumps and well-balanced udders go together. Production is likely to accompany both as in the case of

Baldeen. She has milked up to 73 pounds a day for us on A-R test and is another eighteen to twenty thousand prospect. Her udder and milk veins and her nostrils also tell why she is such a good cow.

Unfortunately, one cannot make a cow. If I could I, of course, would take Lady Rilma's mammary

Margaret Black, 14 years old and going strong. "A dairy cow needs a deep chest and a big middle"

How I Handle Young Stock During the Summer

C. A. UMOSELLE

OWING to the very late spring more chicks were hatched in June than usual, and the hatching was, in many cases, extended into July. To care properly for these late hatched chicks requires much watchfulness to prevent disease from getting a start among them. The use of incubator and brooder insures freedom from lice, but many of us still rely upon the hen, and consequently must fight the lice and a number of other evils.

A brooder is preferable to hens in every way. If we depend upon the hen, there will be chicks trampled to death, chilled to death and possibly some lost or devoured by a neighbor's cat. With a brooder and an inclosed run there are none of these with which to contend, and the percentage of chicks brought successfully to maturity will be correspondingly high. If hens must be used, the nests and all surroundings should be kept clean, and every precaution should be used to keep them free from lice.

At this time my yard is full of young stock of every age from three to eight weeks, and in the brooder yard are others just hatched. All of these last are intended for market and will be brought to the proper size as quickly as possible. They are fed corn bread and finely chopped meat scraps until a week old, then the smaller grains are added, and after the fourth week their principal food is corn, beef scraps and some green stuff.

Free range is not advisable for market fowls. They should have no more exercise than is necessary to insure good health. From the first, grit is absolutely necessary to insure perfect digestion, and failure to provide it will surely cause trouble. I believe that broken china gives more satisfactory results than the grit sold by poultry dealers and the hens eat it more rapidly. In my yard I placed two boxes of grit, one china, the other commercial, and the china was taken eagerly by the fowls, while the other was not eaten until there was no china left.

All young stock not intended for layers or breeders should be disposed of as soon as they reach the proper size. To keep them longer is a useless expense. It is better to sell at once at the prevailing market price, though it may be low, than to wait for higher prices. A disease which kills many young chickens during the summer months is bowel trouble. The principal cause is the feeding of wet food. Often more food is given the fowls than they will eat at once, and in hot weather it soon becomes sour, is eaten later and causes sickness. If not allowed to go too far before treating, bowel trouble can be cured by giving a few doses of ginger to the affected fowl. The best preventive is to feed nothing but dry food.

Lice probably cause more trouble than any of the various diseases; yet the farmers refuse, in many cases, to heed the advice so often given in regard to cleanliness. Lice thrive in filth, and if the house and premises are kept clean the pests will not remain. A liberal use of whitewash and lime will work wonders, but even these will prove ineffective if the droppings are allowed to accumulate for weeks. Clean the poultry house twice a week in summer, and give plenty of sunshine and fresh air. Give free range to the young pullets if possible. They will mature in less time than if confined, and before cold weather sets in they should be laying.

G. L. F. MORE MILK at less cost and a BETTER COW left

THOUSANDS of dairymen testify that they get more milk at less cost and have better cows left when they feed G. L. F. Public Formula Rations. High in digestible nutrients and containing ten different feeds of the best quality, G. L. F. Rations are approved by Prof. E. S. Savage of the New York State College of Agriculture.

The Formulas are Public

You buy concentrates to supplement the roughage you have. Whether it is a 24% or 20% protein ration will depend upon the roughage. To buy feed intelligently you should not only know the protein content, but you should know the pounds of total digestible nutrients in each ton. The Public Formulas of G. L. F. Rations give you these facts; nothing is concealed.

G. L. F. Milk Maker

24% Protein--5% Fat--9% Fiber
200 lbs. Distillers Grains
500 " Gluten Feed
260 " Cottonseed Meal 43%
240 " Oil Meal O. P.
200 " Standard Wheat Bran
100 " Standard Wheat Middlings
160 " Yellow Hominy
100 " Ground Oats
100 " Cane Molasses
100 " Peanut Meal 40%
20 " Salt
20 " Calcium Carbonate

2000 lbs.

1506 lbs. Digestible Nutrients

G. L. F. Exchange Dairy

20% Protein--4.5% Fat--9% Fiber
100 lbs. Distillers Grain
360 " Standard Wheat Bran
260 " Yellow Hominy
200 " Ground Oats
440 " Gluten Feed
140 " Peanut Meal 40%
160 " Cottonseed Meal 43%
100 " Oil Meal O. P.
200 " Cane Molasses
20 " Salt
20 " Calcium Carbonate

2000 lbs.

1452 lbs. Digestible Nutrients

With G. L. F. Rations you know what you are feeding and you are building up your own organization which is in business to protect your interests. In addition to the Milk Rations you have the opportunity to feed G. L. F. Public Formula Calf Meal, Hog Meal, Young and Dry Stock Feed, Horse Feed and a complete line of Poultry Rations.

If you do not have local service, write

Cooperative G. L. F. Exchange, Inc.

To benefit by this guarantee subscribers must say: "I saw your ad in the American Agriculturist" when ordering from our advertisers.

The More You Tell, The Quicker You Sell

EVERY week the American Agriculturist reaches over 120,000 farmers in New York, New Jersey, Pennsylvania and adjacent States. Advertising orders must reach our office at 461 Fourth Avenue, New York City not later than the second Monday previous to date of issue. Cancellation orders must reach us on the same schedule. Because of the low rate to subscribers and their friends, cash or money order must accompany your order.

ALL GOOD THINGS COME TO HIM WHO WAITS—BUT
THE CHAP WHO DOESN'T ADVERTISE WAITS LONGEST

EGGS AND POULTRY

SO MANY ELEMENTS enter into the shipping of day-old chicks and eggs by our advertisers, and the hatching of same by our subscribers that the publishers of this paper cannot guarantee the safe arrival of day-old chicks, or that eggs shipped shall reach the buyer unbroken, nor can they guarantee the hatching of eggs. We shall continue to exercise the greatest care in allowing poultry and egg advertisers to use this paper, but our responsibility must end with that.

CHICKS—S. C. Buff, White and Brown Leghorns, \$9—100; Barred Rocks, \$10—100; W. Rocks, \$12—100; Reds, \$11—100; Mixed light breeds, \$7—100; Mixed heavy breeds, \$9—100. All Number One chicks. Circular free. JACOB NIEMOND, Box A, McAlisterville, Pa.

PULLETS, ALL AGES—White, Brown and Buff Leghorns, Anconas, Minorcas; also yearling hens. FRANK'S POULTRY FARM, Box A, Tiffin, Ohio.

ON APPROVAL—25 yearling S. C. Buff Orpington hens (Owens'), \$2; two cocks, \$4. HILCREST POULTRY FARM, R. 3, Montrose, Pennsylvania.

WOULD LIKE TO CONTRACT for weekly supply of eggs. F. & H. DISTRIBUTING CO., 427 64th Street, Brooklyn, N. Y.

LEGHORN PULLETS—Barron strain, 10 weeks, \$1. Yearlings, \$1. Colliers. EL BRITON FARM, R. 1, Hudson, N. Y.

BEEES

FOR SALE—New Cowan extractor, new Hoffman frames, new comb-honey shipping cases, zinc excluders, foundation, honey gate, glass jars, A B C and X Y Z of bee culture. EDWARD KRUGER, R. 3, Amsterdam, N. Y.

DOGS AND PET STOCK

HUNDRED HOUNDS—Cheap. C. O. D. trial. KASKASKIA KENNELS, Bd. Herrick, Ill.

FOR SALE—English Beagle female rabbit dog and puppies. Write for prices. H. G. OAKLEY, Strattonville, Pa.

WORKING SHEPHERDS AND PUPPIES—Also Foxhounds. ARTHUR GILSON, Canton, N. Y.

HUNDRED HOUNDS—Cheap. C. O. D. trial. KASKASKIA KENNELS, Bd. Herrick, Ill.

SWINE

REGISTERED O. I. C. PIGS and service boars sired by a grandson of C. C. Callaway Edd. GEO. N. RUPRACHT, Mallory, N. Y.

PEDIGREED O. I. C. PIGS—\$6. EL BRITON FARM, Hudson, N. Y.

SITUATION WANTED

POSITION WANTED—By first-class creamery man, 36 years of age; 15 years' experience. Very best of references. W. BURTIS, 34½ Arthur Avenue, Cortland, N. Y.

MALE HELP WANTED

WANTED—Single man on milk farm, milking machines used; state age, wages expected; give references in first letter. S. D. NEWELL, Bristol, Conn.

WOMEN'S WANTS

PATCHWORK—Send fifteen cents for household package, bright new calicoes and percales. Your money's worth every time. PATCHWORK COMPANY, Meriden, Conn.

SMART "HOMEMAID" VOILE FROCKS—\$1.98. Send measurements, buy from peck to hem in back. BENNETTS "HOMEMAID" GARMENTS, Schuylerville, N. Y.

SEEDS AND NURSERY STOCKS

CLOVER—\$4.50 bushel; (Unhulled Sweet) Alfalfa, \$7.00; Red Clover, \$12.00; Grimm Alfalfa, \$22.50; satisfaction or money back; we ship from several warehouses and save you freight. NOW is the time to buy your seeds for next planting. MEIER SEED CO., Dept. AA., Salina, Kansas.

CELERY AND CABBAGE PLANTS—Strong plants ready for field, of all leading varieties, \$1.25 per 1,000. Parcel post, 5 cents per 100 extra. Cauliflower plants, early Snowball—strong, \$3 per 1,000. Send for list. J. C. SCHMIDT, Bristol, Pa.

THE WHITE SUGAR STRAWBERRY is delicious, large and productive; the only white strawberry. Should be in every garden. Set plants now. Twelve for one dollar postpaid. Interesting circular free. A. B. KATKAMIER, Macedon, N. Y.

IMPROVED EDEN GEM CANTALOUPE—Ripened on the vine and shipped you. Extra Large, \$3. Chapel Branch Special, \$2, and \$1 per carrier; cash with the order, f. o. b. T. M. SMITH, Seaford, Del.

STRAWBERRY PLANTS for August and Fall planting (Samples), \$4 per thousand. Special attention given to large orders. Write BOX 122, Watts Flats, N. Y.

CELERY PLANTS—35 cents per 100, ready for shipment; check or P. O. order. E. M. FETTER, R. D. 1, Lewisburg, Pa.

CATTLE

FOR SALE—Shorthorns, 3 bulls, 5 cows and heifers. All from noted pedigrees. My prices are attractive. Write to JORDAN FARMS, Claysville, Pa.

FOR SALE—Pure-bred milking-strain Durham bull, sixteen months old, nicely marked and perfect. Price \$250. ROBERT F. HEPBURN, Bloomfield, N. J.

CATTLE—\$100 each, registered Ayrshire 2-year-old heifers with breed, size and color. ARDEN HILL FARMS, Alfred Station, N. Y.

REAL ESTATE

\$2.50 PER ACRE—Best land, climate and markets; South America a paradise for farmers and stockmen; no winter, no irrigation, no taxes; your last big opportunity; railroads, packing houses and oil companies getting in; join our colony now; time payments. Booklet 50c, other literature free. BOLIVIA COLONIZATION ASSOCIATION, Portland, Ore.

FOR SALE—Fine old Dutch Colonial house, 9 rooms and bath, recently renovated, all improvements except gas; large, good outbuildings; 2½ acres land; 3 miles from Plainfield on main road; near school and trolley, easy commuting to New York City; \$12,500. Apply owner, JAS. A. HOWE, Mountain Avenue, Scotch Plains, N. Y.

FOR SALE—Farm of 100 acres, 97 cultivated; five-minute walk to creamery, feed store, depot, high school; 25 heads of stock, 75 hens; all farming tools; fine buildings. Write for terms. BOX 88, South New Berlin, N. Y.

FARM FOR SALE—136 acres, large brick house, near Saratoga Springs, New York. Address owner, JOHN DIMICK, Gansevoort, N. Y.

HELP WANTED

ALL men, women, boys, girls, 17 to 60, willing to accept Government positions, \$117-\$190, traveling or stationary, write MR. OZMENT, 258 St. Louis, Mo., immediately.

EXPERT DAIRYMAN—Experienced in certified milk. Also farm mechanic able drive motor truck and tractor. MOHEGAN FARM CORP., Mohegan Lake, N. Y.

FEMALE HELP WANTED

GIRLS—WOMEN!—Learn Dress Draping-Making. \$30 per week. Sample lessons free. Write immediately. FRANKLIN INSTITUTE, Dept. B 542, Rochester, N. Y.

The Service Bureau

And Questions and Answers About Investments

IT took a little while to straighten out the matter of a refund check due Miss D. C. of New York, for a lamp she had returned to a New York firm as unsatisfactory. The firm acknowledged the indebtedness, but had simply fallen behind. A little pressure from the Service Bureau aided them in speeding up the work and Miss C. wrote us that the check had come and that the matter was closed.

NO LAWYER WILL HANDLE THIS CASE

A dog-seller who takes the money but does not send any sort of dog in return is F. O. Smith of Altamont, Ill. A local firm of lawyers, in whose hands we placed a \$35 account for collection, wrote us:

"Enclosed herewith you will please find the above entitled account which we are returning for the reason that it is our opinion that it is absolutely worthless and uncollectable. We receive a great many accounts of this kind and similar nature and have never been able to collect any of them. This man is engaged in the sale of dogs and very frequently we have the same set of facts as are presented to us in this case. We understand that the Federal authorities have made some investigations and would like to know the results of these investigations."

That is sufficient warning against trading with Mr. Smith of Altamont, Illinois.

QUESTIONS AND ANSWERS ABOUT INVESTMENTS

Financial Department:—Please give me your advice on the Union Finance Company? (Letter attached.)—A. G., New York.

We do not recommend stock of this company. The circular you enclose says that only 500 persons will be permitted to take advantage of the offer which is made to you. We suggest you let some other people make up the 500. In this case we believe a little unselfishness on your part would be profitable.

Not Strictly Conservative

Financial Department:—Will you please let me know if the Frederick Investment Company (circular attached) is safe and sound?—H. L., Maryland.

The Frederick Investment Company seems to have a good record, but we

AGENTS WANTED

AGENTS WANTED—Agents make a dollar an hour. Sell Mendets, a patent patch for instant mending leaks in all utensils. Sample package free. COLLETTE MFG. CO., Dept. 210, Amsterdam, N. Y.

SHEEP

SHEEP FOR SALE—14-grade Rambouillet ewes in fine condition. Price \$85. REED CHAMPLAIN, Alfred Station, N. Y.

MISCELLANEOUS

ACETYLENE FIXTURES—All kinds, by parcel post. Globes, lighters, burners, sad-irons, hot plates, etc. New and used generators and parts at bargain prices. Circulars free. C. A. BROWN, Mansville, N. Y.

LATEST STYLE SANITARY MILK TICKETS save money and time. Free delivery. Send for samples. TRAVERS BROTHERS, Dept. A, Gardner, Mass.

LANDSCAPE FIRM DESIRES quotations on Christmas trees. State kind and height. BENNETT & JONES, R. 3, Johnstown, Pa.

DELCO PLANT—¾ R. W. with new batteries, \$250. ¼ H. D. 32 volt motor, \$15. H. VAN KUREN, Rummerville, Pa.

FOR SALE—9-18 Case Tractor in good condition; \$200 takes it; f. o. b. C. J. STAFFORD, R. 3, Cortland, N. Y.

are unable to find a market for the stock, which may or may not be a disadvantage in your case. It is also possible for dealers in musical instruments to meet with severe competition. You should not put more than a small part of your funds into this kind of a security.

Sound Investments

Financial Department:—I wish to know if the 7% cumulative preferred stock in the Power Corporation of New York may be relied upon as a safe investment for a moderate amount? I have a small amount in the bonds of the Northern New York Utilities and would appreciate your judgment on these also. I have an American Telephone & Telegraph bond of 5%, but it now gives me but little over the 5%. If I can get 6% or 7%, with safety, I would like it. I also have a small amount in French Republic 7½%, but do not care to keep them. I paid 95 for them. Would you hold them for a time at least? What do you think of real estate bonds in such cities as Chicago and Atlanta if handled by long-established concerns?—H. H. L., New York.

We think your Northern New York Utilities bonds are good investments, but inasmuch as you already hold these it would be better to take some other preferred stock than Power Corporation, which is affiliated with the Northern New York Utilities. We suggest the new Duquesne Light 7 per cent preferred. Your American Telephone & Telegraph 5 per cent bond is also very good. You could get a little more by buying Hershey Chocolate 6s, which are listed on the New York Stock Exchange, and are, in our opinion, well secured. We advise you to keep your French bond. As to the real estate securities, everything depends on the property on which they are a lien. Probably most of them handled by old-established concerns are sound. You must remember, however, that this kind of an investment is not easily marketable.

Not Earning Fixed Charges

Financial Department:—I own a few shares of the capital stock of the New Haven R. R. Can you tell me if the company is at present earning their fixed charges? Are any of their bond issues due in 1923?—G. A. W., Maryland.

The New Haven Railroad is not earning its fixed charges on the basis of the latest returns. According to the indications for the first eleven months of 1922, 86 per cent of such charges would be earned. The road has two small issues maturing in 1923 aggregating \$500,000, besides equipment obligations amounting to \$1,411,900. There are no large maturities.

Keep Away From Gas and Oil

Financial Department:—Kindly advise me if you know anything of the U. S. Gasoline Corporation? (Circular attached.)—Mrs. S. B. C., New York.

Stock in U. S. Oil Gasoline is a speculation which we do not advise unless you are in a position to assume the risk involved. Until the process has been proved and the company is operating and demonstrating its ability to make profits for its stockholders its shares have no claim to an investment rating.

Buy Marketable Stocks

Financial Department:—What do you think of investing in the Old Colony Mills, Inc., 922 Chestnut Street, Philadelphia, Pa.? They are offering shares of preferred stock at \$5—3%. (Circular attached.)—I. D. B., New York.

Unless you are in a position to keep in close touch with the earnings of this company we advise you to buy more seasoned securities. You cannot get 8 per cent without assuming risk and only those should assume the risk who have some familiarity with the business in which the company is engaged. You should also consider the question of marketability. In the case of a new organization, there is not likely to be a market for the stock, and some day you may want to realize on your investment.

The Agricultural Situation

G. F. Warren Says Conditions Best in New York

THE most interesting, most accurate and most valuable statement that we have seen on the present farm situation has just been issued by Professor George F. Warren, head of the Farm Management Department of the New York State College of Agriculture. Professor Warren is one of the most noted farm economists in America. His statement is filled with such good "horse sense" that we wish it might be read as a guide for future operations by every farmer in the United States and particularly by those who live in the eastern sections. The statement says:

"Agriculture has been over-expanded and world demand has been checked by the war. These facts are in large part responsible for the present agricultural panic which has lasted four years and is the worst panic that American farmers have ever experienced." Professor Warren states that periods of hard times cause farmers to rush from one thing into another which causes future disorganization and dissatisfaction. "What is needed is a small readjustment, but a general continuance in the type of farming adapted to the particular region rather than wild shifting from one thing to another."

Poor Farm Land Not Needed

His next statement is so important that we are running it in capital letters. "SOME OF THE POOR FARMS AND POOR FIELDS ON BETTER FARMS ARE NOT NEEDED FOR A TIME." We wish this statement could be shouted from the top of every farm house in the nation. Abandoning the farms and fields that do not pay to work are one of the best things that can happen to agricultural industry. Professor Warren says further on this same point: "New York has much of the finest land in the United States. It also has much land that will not produce enough crops to anywhere near pay wages to the man who grows them. Considerable of this land was cleared when the demand for food was such that men were willing to work two days for a bushel of wheat. It was not adapted to the pre-war conditions when men were paid two bushels of wheat for one day's work. It is much less adapted to present conditions when four or five bushels of wheat are required to hire a man a day. Much of this land should be in forests. Some of this cheap hill land might well be purchased by the State and re-forested." We might add that the same statement applies to nearly all the other States.

"There are some farms," continues Professor Warren, "of a little better grade that are not now needed but that may be needed soon enough so it will pay to keep them as farms rather than re-forest. Such land can be used for pasture or it may be left to grow up to weeds for some years. The soils are much in need of humus. The natural growth is often the most economical means of improving the soil."

Poorer Fields Into Pasture

"On most of the farms of the State there are fields of low fertility that will not pay for intensive use. A more liberal use of this land for pasture will save feed and labor. Cows may be allowed more pasture land and horses may be pastured. By leaving some of the poorest land in pasture, and leaving some that is a little better in hay as long as it will stand, a farm can be worked with less labor and less cost."

"With the present high prices of machinery and labor and low prices of farm products, it does not pay to go through all the motions of crop production and then get a poor crop. Only the land that promises to yield well should be plowed and the area should be kept small enough so that it can be well cared for. This may mean using the manure and labor on smaller areas of the best land. Poorer land should be left for pasture and hay."

"This does not mean more hay. There are already too many acres in hay. Horses in cities have decreased so much that much less hay is needed. It means putting the poorest hay land

in pasture and leaving more of the next grade of land in hay. At the same time that the area devoted to hay is reduced, the production of clover and alfalfa hay needs to be increased.

"Much less readjusting needs to be done on the best farm lands. A part of the areas of such farms is often devoted to crops, the consumption of which rises as the standard of living rises. If the more essential foods are cheap, the demand for the less essential ones rise. Such farms can do very well if the area of such crops is not too much expanded, and so long as there is full employment."

"The young man who desires to be a farmer need not change his plan but he does need to change his method of procedure."

The General Farm Situation

In speaking of the general farm situation, Professor Warren says, "For many years, ending with about 1896, the general price level was declining. Farm prices declined even more rapidly. They were lowered by the same causes that lowered the general price level and in addition were crowded down by the rapid expansion of agricultural production. Beginning with 1897 prices began to rise more rapidly from 1910 to 1920. The rising prices causes rapid expansion of agriculture in the United States and Canada. North America, Australia and the Argentine expanded their production."

In showing that the demand for the farm products of this great agricultural expansion is falling off, Professor Warren says, "Europe is now trying to be self-supporting. Agriculture there, is recovering more rapidly than industry so that the need for imports is rapidly falling. At the same time in many of the countries the ability to buy is declining."

"There seems to be no reason that wheat and pork exports from the United States and Canada can continue for many years at the present high level. Some persons would not have some facts known for fear that farmers will adjust their production to meet the situation. But an adjustment will be made and if made before the losses are too heavy it will be best for all concerned. A SMALL REDUCTION IN THE WHEAT ACREAGE NOW IS BETTER THAN A VIOLENT REDUCTION LATER WHEN DISILLUSIONMENT COMES AFTER TRYING ALL MANNER OF DEVICES TO OBTAIN SATISFACTORY PRICES."

Optimistic About New York

Professor Warren is particularly hopeful regarding the New York situation which, of course, applies practically the same to other eastern States. Note especially his point that we farmers of the East are especially dependent for good prices for our products upon high wages which the workmen of the cities receive. Therefore while these high wages work to our disadvantage in hiring farm help, this is much more than offset by giving our consumers increased buying power for our products.

Professor Warren says on the New York situation: "The weighted index for United States farm prices in June was 135, for New York farm prices it was 163. For some years it is to be expected that the high freight rates and high wages will act as a protective tariff to New York agriculture so that farm prices will continue to be more favorable than the United States average. At the present time, the New York average is also raised on account of the character of its products. Dairy and poultry products make up a high percentage of the weighting for the New York index. Both of these products tend to respond to wage conditions. With wages at double the pre-war scale these products are holding up better than grains."

"With wages at such a high level, it is to be expected that there will be periods of full employment at high wages and frequent periods of unemployment when the demand for New York products will be low. As a whole, the buy-

for every risk the Farmer takes—there is a Hartford Policy

Lightning causes thousands of fires—Are you Insured?

LIGHTNING causes thousands of fires a year that destroy farm property, yet lightning is only one cause of loss.

To help the farmers of America check up the property they own, so that they can wisely insure against fire and lightning, the Hartford Fire Insurance Company has prepared a handy inventory book, called "MY PROPERTY."

It makes it easy to fix the value of your buildings, their contents, your live stock, and all kinds of personal property.

The Brown Mouse—By Herbert Quick

"I SHOULD think it would be awfully hard for you to get fitted in the stores," said she, "you are so very tall."

"It would be," said Jim, "if I had ever considered the matter of looks very much. I guess I'm not constructed on any plan the clothing manufacturers have regarded as even remotely possible. How about this county fair idea? Couldn't we do this next fall? You organize the teachers—"

Jennie advanced the spark, cut out the muffler and drowned the rest of Jim's remarks in wind and dust.

"I give it up, dad," said she to her father that evening.

"What?" queried the colonel.

"Jim Irwin's clothes," she replied. "I think he'll go to Ames in a disgraceful plight, but I can't get any closer to the subject than I have done."

"Oh, then you haven't heard the news," said the colonel. "Jim's going to have his first made-to-measure suit for Ames. It's all fixed."

"Who's making it?" asked Jennie.

"Gustaf Paulsen, the Dane that's just opened a shop in town."

"A Dane?" queried Jennie. "Isn't he related to some of the neighbors?"

"A brother to Mrs. Hansen," answered the colonel.

"Bettina's uncle!"

"Ratherly," said the colonel jocularly, "seeing as how Bettina's Mrs. Hansen's daughter."

Clothes are rather important, but the difference between a suit made by Atkins the tailor, and one built by Gustaf Paulsen, the new Danish craftsman, could not be supposed to be crucially important, even when designed for a very dear friend. And Jim was scarcely that—of course not! Why, then, did the county superintendent hastily run to her room, and cry? Why did she say to herself that the Hansens were very good people, and well-to-do, and it would be a fine thing for Jim and his mother—and then cry some more? Colonel Woodruff failed to notice Jennie's unceremonious retirement from circulation that evening, and had he known all about what took place, he would have been as mystified as you or I.

CHAPTER XVIII

JIM GOES TO AMES

THE boat tipped over, and Jim Irwin was left struggling in the water. It was in the rapids just above the cataract—and poor Jim could not swim a stroke. Helpless, terrified, gasping, he floated to destruction, and Jennie Woodruff was not able to lift a hand to help him. When a young man who was once that county superintendent's sweetheart, falls in, clothed in a new made-to-order suit in which he looks almost handsome, the experience is something almost impossible to endure. That is why Jennie gripped her seat until she must have scratched the varnish.

And then Jim began to swim. He cast aside the roll of manuscript, and struck out for the shore with strong strokes—wild and agitated at first, but gradually becoming controlled, and Jennie drew a long breath as he finally came to shore, master of the element in which he moved. There was a burst of applause, and people went forward to congratulate the greenhorn who had really made good.

Jennie felt like throwing her arms about his neck and weeping out her joy at his escape, and his restoration to her. Her eyes told him something of this; for there was a look in them which reminded him of fifteen years ago. Bettina Hansen was proud of him, and Con Bonner shook his hand and said that he agreed with him. Neither Bettina nor Con had noticed the capsizing of the boat, but Jim knew how near he had been to disaster, and knew that Jennie knew. For she had seen him turn pale when he came on the platform had seen him begin the speech, had observed how unable he was to remember it, had noted his confusion as he tried to find his manuscript, they had seen him begin just talking to his audience, and had observed how he won first their respect, then their attention, then apparently their convictions.

Jim had never felt more the upstart, uneducated farm-hand, than when he was introduced by Professor Withers, nor more completely disgraced than when he concluded his remarks. Even the applause was to him a kindly effort on the part of the audience to comfort him in his failure. His only solace was the look in Jennie's eyes.

"Young man," said an old farmer who wore thick glasses and looked like a Dutch burgomaster, "I want to have a little talk with you."

"This is Mr. Hofmyer of Pottawatomie County," said the dean of the college.

"I'm glad to meet you," said Jim.

"I can talk to you now."

"No," said Jennie. "I know Mr. Hofmyer will excuse you until after dinner. We have a little party for Mr. Irwin, and we shall be late if we don't hurry."

"Where can I see you after supper?" asked Mr. Hofmyer.

Easy it was to satisfy Mr. Hofmyer; and Jim was carried off to a dinner given by County Superintendent Jennie to Jim, the dean, Professor Withers, and one or two others—and a wonderfully select and distinguished company it seemed to Jim. Jennie seized a moment's opportunity to say, "You did beautifully, Jim; everybody says so."

"I failed!" said Jim. "You know I failed. I couldn't remember my speech."

"You made the best address of the meeting; and you did it because you forgot your speech," insisted Jennie.

"Does anybody else think so?"

"Why, Jim! Even Con Bonner says it was the best. He says he didn't think you had it in ye!"

"What does Professor Withers say?" he asked.

"He's delighted—silly!"

"Silly!" How wonderful it was to be called "silly"—in that tone.

"I shouldn't have forgotten the speech if it hadn't been for this darned boiled shirt and collar, and for wearing a cravat," urged Jim in extenuation.

"You ought to've worn them around the house for a week before coming," said Jennie. "Why didn't you ask my advice?"

"I will, next time, Jennie," said Jim. "I didn't suppose I needed a biting-rig—but I guess I did!"

Jennie ran away then to ask Nils Hansen and Bettina to join their dinner party. She had a sudden access of friendliness for the Hansens. Nils refused because he was going out to see the college herds fed; but at Jennie's urgent request, reinforced by pats and hugs, Bettina consented. Jennie was very happy, and proved herself a beaming hostess. The dean devoted himself to Bettina—and Jim found out afterward that this inquiring gentleman was getting at the mental processes of a specimen pupil. He thanked Jim for his speech, and said it was "most suggestive and thought-provoking," and as the party broke up slipped into Jim's hand a check. Jim felt like returning it to the conscience fund of the State of Iowa, if it by any chance possessed such a fund.

CHAPTER XIX

JIM'S WORLD WIDENS

MR. HOFMYER was waiting to give Jim the final convincing proof that he had produced an effect with his speech.

"Do you teach the kind of school you lay out in your talk?" he asked.

"I try to," said Jim, "and I believe I do."

"Well," said Mr. Hofmyer, "that's the kind of education I b'lieve in. I kep' school back in Pennsylvania fifty years ago, and I made the scholars measure things, and weigh things, and apply their studies as fur as I could."

"All good teachers have always done that," said Jim. "Froebel, Pestalozzi, Colonel Parker—they all had the idea which is at the bottom of my work; 'learn to do by doing.'"

"M'h'm," grunted Mr. Hofmyer, "I hain't been able to see how Latin connects up with a high-school kid's life."

"But it used to relate to life," said Jim, "the life of the people who made Greek and Latin a part of everybody else's education as well as their own. But now"—Jim spread out his arms as if to take in the whole world—"science, the marvelous literature of our tongue in the last three centuries! And to make a child learn Latin with all that, a thousand times richer than all the literature of Latin, lying unused before him!"

"Know any Latin?" asked Mr. Hofmyer.

Jim blushed, as one caught in condemning what he knows nothing about.

"I—I have studied the grammar, and read *Caesar*," he faltered, "but that isn't much."

"I've had all the Latin they gave in the colleges of my time," said Mr. Hofmyer, "if I do talk dialect; and I'll agree with you so far as to say that it would have been a crime for me to neglect the chemistry, bacteriology, physics, engineering and other sciences that pertain to farmin'—if there'd been any such sciences when I was gettin' my schoolin'."

"And yet," said Jim, "some people want us to guide ourselves by the courses of study made before these sciences existed."

"I don't, by hokey!" said Mr. Hofmyer. "I'll be dag-goned if you ain't right. I wouldn't 'a' said so before I heard that speech—but I say so now."

Jim's face lighted up at this, the first convincing evidence that he had scored.

"I b'lieve, too," went on Mr. Hofmyer, "that your idee would please our folks. I've been the standpatter in our parts. What d'ye say to comin' down and teachin' our school? We've got a two-room affair, and I was made a committee of one to find a teacher."

"I—I don't see how—" Jim stammered, all taken aback by this new breeze of recognition.

"We can't pay much," said Mr. Hofmyer. "You have charge of the discipline in the whole school, and teach in Number Two room. Seventy-five dollars a month. Does it appeal to ye?"

Appeal to him! Why, eighteen months ago it would have been worth crawling across the State after, and now to have it offered to him—it was stupendous. And yet, how about the Simmses, Colonel Woodruff, the Hansens and Newton Bronson, now just getting a firm start on the upward path to usefulness and real happiness?

"I'm afraid I can't," said Jim Irwin, "but—"

"If you're only 'fraid you can't," said Mr. Hofmyer, "think it over. I've got your post-office address on this program, and we'll write you a formal offer. We may spring them figures a little. Think it over."

"You musn't think," said Jim, "that we've done all the things I mentioned in my talk, or that I haven't made any mistakes or failures."

"Your county superintendent didn't mention any failures," said Mr. Hofmyer.

"I had not supposed," said Jim, "that she had a very high opinion of my work."

"I didn't ask her about that," said Mr. Hofmyer, "though I guess she thinks well of it. I asked her what you are tryin' to do, and what sort of a fellow you are. I was favorably impressed; but she didn't mention any failures."

"We haven't succeeded in adopting a successful system of selling our cream," said Jim. "I believe we can do it, but we haven't."

"Wal," said Mr. Hofmyer, "I d'know as I'd call that a failure. The fact that you're tryin' of it shows you've got the right ideas. We'll write ye, and mebbe pay your way down to look us over. We're a pretty good crowd, the neighbors think."

CHAPTER XX

THINK OF IT

AMES was an inspiration. Jim Irwin received from the great agricultural college more real education in this one trip than many students get from a

four years' course in its halls; for he had spent ten years in getting ready for the experience. The great farm of hundreds of acres, the commodious classrooms and laboratories, and especially the barns, the greenhouses, gardens, herds and flocks filled him with a sort of apostolic joy.

"Every school," said he to Professor Withers, "ought to be doing a good deal of the work you have to do here."

"I'll admit," said the professor, "that much of our work in agriculture is pretty elementary."

"It's intermediate school work," said Jim. "It's a wrong to force boys and girls to leave their homes and live in a college to get so much of what they should have before they're ten years old."

"There's something in what you say," said the professor, "but some experiment station men seem to think that agriculture in the common schools will take from the young men and women the felt need, and therefore the desire to come to the college."

"If you can't give them anything better than high-school work," said Jim, "that will be so; but if the science and art of agriculture is what I think it is, it would make them hungry for the advanced work that really can't be done at home."

"I think you're right," said the professor.

"Give us the kind of schools I ask for," cried Jim, "and I'll fill a college like this in every congressional district in Iowa, or I'll force you to tear this down and build larger."

The professor laughed at his enthusiasm.

More nearly happy, and rather shorter of money than he had recently been, Jim journeyed home among the companions from his own neighborhood.

WHAT HAS HAPPENED

JENNIE WOODRUFF, who had always taken Jim Irwin very much for granted, finds him developing into a community hero. He has made the school so famous that it has exhibited at the Farmer's Week, and he has been asked to speak at the college, too. And just then she overhears a conversation which links the names of Jim and Bettina Hansen, a neighbor's daughter. Meanwhile Jim is going ahead with his school plans in spite of the opposition of a "stand pat" school board.

Mr. Hofmyer had dropped from his mind, until Con Bonner, his old enemy, drew him aside in the vestibule of the train and spoke to him in the mysterious manner peculiar to politicians.

"What kind of a proposition did that man Hofmeister make you?" he inquired. "He asked me about you, and I told him you're a crackerjack."

"I'm much obliged," replied Jim.

"No use in back-cappin' a fellow that's tryin' to make somethin' of himself," said Bonner. "Anything to him?"

"He offered me a salary of seventy-five dollars a month to take charge of his school," said Jim.

"Well," said Con, "we'll be sorry to lose yeh, but you can't turn down anything like that."

"I don't know," said Jim. "I haven't decided."

Bonner scrutinized his face sharply, as if to find out what sort of game he was playing.

"Well," said he, at last, "I hope you can stay with us, o' course. If the rist of the district can stand your kind of thricks, I can. And say, Jim"—here he grew still more mysterious—"if you do stay, some of us would like to have you go into the next convintion f'r county superintendent."

"Why," replied Jim, "I never thought of such a thing!"

"Well, think of it," said Con. "The county's close, and wid a pop'lar young educator—an' a farmer, too, it might be done. Think of it."

It must be confessed that Jim was almost dazed at the number of "proposi-

Alfalfa in the Orchard

The Experience of a West Virginia Grower

IN the July 7th issue of the American Agriculturist, I noticed your editorial on alfalfa in the orchard and you ask for other experiences. I have been deeply interested in this subject for many years and have watched for results carefully.

I have an orchard of about 6,000 Delicious, Winesap, and Rome Beauty apple trees in West Virginia that are now eleven years of age. One part of this orchard was planted to alfalfa when the trees were two years of age. A strip two and one-half to three feet wide was left for cultivation, which was continued for two years. Another part of the orchard was cultivated; rye and vetch was planted as cover crop, turned under, and planted to potatoes, which were cultivated and fertilized. This was probably better land than that planted to alfalfa. The trees in the alfalfa made better growth, even where every particle of the alfalfa was

By B. G. PRATT

season almost twice as great as that on the other. About a half a case of cherries per tree was taken from the sod block, while the cuttings of alfalfa for hay have paid the cost of caring for the orchard ever since the first year of planting. Each tree in this plot was given an application last spring of one pound of acid phosphate and one-half pound of nitrate of soda.

"An interesting pruning experiment is being carried out on the station with apples. In a block of four-year-old Duchess trees, the unpruned trees have made a larger growth and have set a fair crop of fruit; moderately pruned and budded trees have a light set of fruit and are smaller, while a tree pruned according to the modified leader system has no fruit and growth has been greatly retarded. Similar results have been obtained on the station with Grimes' Golden and Winesaps. Tests with Spies, Baldwins and Greenings are

Eight year old delicious trees in Mr. Pratt's orchard

cut and put in the barn, than the other.

The enclosed picture was taken when this orchard was eight years of age, after five years of alfalfa and no fertilization whatever. The growth is actually excessive. This orchard set a beautiful crop of fruit in its sixth year, but was totally destroyed by hail, which also injured the foliage so that there was no crop the following year.

I do not believe that alfalfa will detract anything from an apple orchard, especially if one crop at least of the alfalfa is used for mulching the trees. The alfalfa root goes very deep after moisture and I hardly believe that an alfalfa root may be well supplied with water, while an apple root, intertwined with it, will suffer from lack of moisture.

But, whether alfalfa cuts down the growth and vigor of the tree, all the evidence that I have been able to gather seems to indicate that apple trees in alfalfa are great producers. My attention was called to this a great many years ago in an article in "Better Fruit," which gave the average crop for fifteen years in two orchards, one in alfalfa, the other clean culture and cover crops. The average in the latter orchard was ten and a fraction boxes per tree. And, in the alfalfa orchard, nineteen and a fraction.

I know of an apple orchard in New Jersey in alfalfa sod that averaged a bushel per tree of boxing fruit when they were five years of age and some trees producing as high as four and one-half bushels per tree.

The "New York Packer," July 21, carried a story in regard to the planting of cherry trees in the alfalfa orchard as against clean cultivation at the Michigan Agricultural College. While the cultivated plot produced trees almost twice as large as those in the sod, the latter are producing a crop of fruit this season almost twice as great as that of the other.

"One block of trees at the station has been set in an alfalfa sod. Alongside of it is another block of three-year-old trees growing under clean culture. These two blocks furnish a striking comparison. The cultivated plot is producing trees almost twice as large as those in the sod, but the latter are producing a crop of fruit this

not far enough advanced to determine the value of pruning as a means of bringing an orchard into early production. The station is seeking methods by which growers can plant orchards and bring them into earliest production at the lowest possible cost.

SWEET CLOVER AS COVER CROP

Would you think it advisable to use sweet clover for a cover crop in orchards in this section of the country? If so, when should it be sown, how much to the acre and about how much does it cost per bushel?—L. P., Niagara Co., N. Y.

Under our conditions the limiting factor in orchard growth is fertility. Now let us decide that there is enough fertilizers, nitrogen excepted, in the furrow slice to produce fruit for more than 50 years. This is shown us in agricultural chemistry. Also we have observed two generations of apple trees on the same soil without exhaustion. Then the question comes to one of nitrogen and availability. The Pennsylvania Station has clearly shown that nitrogen is the controlling element in growth in young orchards. Careful summaries on my farm have shown that nitrogen in tops and roots of a sweet clover sod, 13 months old, was equal to one ton of nitrate of soda per acre. Young plants winter-kill, and I would try for Central New York the main sowing July 15, with small experimental sowings July 1 and August 1. The seed costs a little less than red clover. Use only scarified seed. We are trying out the sweet clover mulch system, and expect it to be best of all for apples. It has made good elsewhere.—G. E. S.

"Please find enclosed money-order for my renewal of the best farm magazine that goes through the mails. Rather a presumptuous remark, but will say I read them all, at least the important ones, and after a good going over, by the kitchen stove, with a good old wood fire to help the digestion of contents, I find a fearless 'Editorial Page' and a dependable market report. Also, your page entitled 'How Shall I Invest My Money?' seems to appeal to me as sensible."—Albert Slingerland, Selkirk, N. Y.

WE OFFER

\$1,000.00

for accidental death or injury in a travel accident under the conditions mentioned in the lower left hand column below.

Tragic auto accidents and train wrecks occur so frequently that you never know but what your turn is next. In justice to your family you should carry some Travel Accident Insurance.

We have secured for our readers a policy that costs so little as to be within the reach of every one.

A \$1,000.00 Policy For Only 50 Cents

Provided you send your three-year subscription for AMERICAN AGRICULTURIST at the same time. In other words, you get a \$1,000.00 Travel Accident Policy for one year and a three-year subscription for AMERICAN AGRICULTURIST, both for only \$2.50.

This Tells You What the Policy Will Pay

The following shows the Protection given to A. A. Readers by the North American Accident Insurance Co. of Chicago. Read, then Cut the Coupon and Mail It.

This Company will pay the following amounts, subject to the terms of the policy, for death or disability on a public carrier, due to its wrecking or disablement while the insured is riding as a fare-paying passenger, or due to the wrecking or disablement of any private horse-drawn or motor-driven vehicle on which insured may be riding or driving, or by being thrown therefrom.

Life	One Thousand Dollars (\$1,000.00)
Both Hands	One Thousand Dollars (\$1,000.00)
Both Feet	One Thousand Dollars (\$1,000.00)
Sight of Both Eyes	One Thousand Dollars (\$1,000.00)
One Hand and One Foot	One Thousand Dollars (\$1,000.00)
Either Hand and Sight of One Eye	One Thousand Dollars (\$1,000.00)
Either Foot and Sight of One Eye	One Thousand Dollars (\$1,000.00)
Either Hand	Five Hundred Dollars (\$500.00)
Either Foot	Five Hundred Dollars (\$500.00)
Sight of Either Eye	Five Hundred Dollars (\$500.00)
Total Disability, 13 weeks or less,	Ten Dollars (\$10.00) per week
Life, by being struck, knocked down or run over by vehicle, while standing or walking on public highway	Two Hundred and Fifty Dollars (\$250.00)

The above indemnities will be paid, subject to the provisions and conditions of the policy. A complete numbered and registered policy will be supplied each person insured. Be sure to read it before filing away.

This Travel and Pedestrian Accident Insurance will protect every registered subscriber of American Agriculturist who pays a 50 cent fee at the same time he pays \$2.00 for a three-year subscription for American Agriculturist.

It will come in mighty handy for your family to receive \$1,000.00 in case you are killed or crippled under the conditions mentioned below. And to think that you can get this protection for only 50c extra added to your three-year subscription for AMERICAN AGRICULTURIST. Surely there is no reader of this paper that can afford to miss this unusual opportunity. If your subscription does not expire yet, accept this offer just the same and have your subscription extended three years from present expiration date.

Don't trust to luck. Play safe. Order one of these policies today. The price will advance soon.

MAIL THIS COUPON BEFORE YOUR ACCIDENT

TO AMERICAN AGRICULTURIST, A-18
461 FOURTH AVE., NEW YORK CITY.

GENTLEMEN: Please enter my subscription for American Agriculturist three years and send me a \$1,000.00 Travel Accident Policy, good for one year. Enclosed find \$2.50 in full payment for both the policy and subscriptions.

FOR THE MAN WHO LOVES HIS FAMILY

Plenty of Variety in a Rural Nurse's Life

Miss Sara F. Buchanan Tells of Her Daily Experiences—New Fall Styles For the Girl

THE telephone jangled. Sleepily I reached out for the receiver. "Jeem's sick and you come right away," came the message in broken English. Not knowing any Jim, I was puzzled and said "Jim, Jim who?"; then: "This is Vincenza Campeleri and Jim's our boarder." I knew Vincenza so I said I would come around to see her.

As rural public health nurse in one of the districts of northern Westchester County, N. Y., I had become well acquainted with the Italians in the little settlement just outside our pretty village. Soon I had my Ford from the garage and was on my way to find Jim. I found him in the building known as the "Old Church," once a place of worship, now a tenement house. Children seemed fairly to swarm from the building.

Jim was lying on a cot in a tightly closed room, covered with many blankets. It was a July morning. It seemed as if every Italian woman in the place had come into the room and all were talking at the same time. Jim spoke English very well but the difficulty was to hear him above the others. I took his temperature and found it high. I gave a warm bath, showing one of the women how to give it, and helped her make the bed, explaining at the same time the need of fresh air in the room. Since Jim was only a boarder I dared to suggest to him the advisability of going to the hospital. He consented to do so if I would make the arrangements.

A Health Center Under a Tree

The children and mothers followed me to the door asking innumerable questions. I felt the need more than ever of a Health Center where I could save time by meeting the mothers in groups, for my territory is large and even with the help of the Ford I find I must conserve every minute of time. So I said, turning to the children, "I should like to have a room where we could all gather but I do not know of one, so we will meet next Wednesday afternoon under this tree. I will bring my scales and we will get weighed and measured."

I was surprised and gratified when one of the mothers, with twins in her arms and another pair at her skirts said, "I have a room you may use."

Miss Buchanan and some of her younger friends

We looked at the room and found it would do. The chairman of my committee sent a table from the Methodist Church, neighbors loaned us their chairs, we made our posters and in a twinkling we had our Health Center.

On the afternoon of our opening we had thirty children present ranging from infants in arms to children of school age. I had two volunteer workers to assist with the weighing and measuring. We gave each child a health tag showing his actual weight and normal weight.

The children became keenly interested in getting up to normal. Two of

the mothers, seeing their children so much underweight and learning that the diseased condition of their tonsils might be the cause, consented to see their family physician and on his advice have the tonsils removed. They now are most enthusiastic in watching their children gain.

Magazines with attractive advertisements were contributed by interested friends for scrapbooks and posters. The children made menus and cut out appropriate advertisements to illustrate the food selected.

From a Borrowed Room to a Permanent One

We had to give up our room when cold weather came "For," said Mrs. Cavelli, "this is our warmest room in winter and we use it for the children, but you can have it again next summer."

This small beginning, however, showed my committee the great need and after many efforts a most attrac-

Snowdrifts cannot stop the sturdy little "Flivver"

tive room has been secured in the central part of the village. The Civic Club has given us the use of their furniture, while posters were donated.

In May, the State Department of Health gave us two days for a clinic for well children of pre-school age. Forty apparently well children were examined, but after examination, in some instances, parents were advised to consult their family physician in regard to defects found. Parents thus have the opportunity of freeing their children from physical handicaps before entering school, which means reduced taxes for the taxpayer, for every time a child repeats his grade the taxpayer pays double for the education of that child.

Sixteen public schools are within the limits of the district; all but four are one-room buildings. To do intensive school work has been impossible for one nurse who has also to give bedside care; but by being with the doctors, when they made the physical examination in the schools, the most imperative cases could be selected and the parents interviewed in regard to medical treatment. Sometimes, as in the case of Jackie's eyes, treatment had been deferred too long.

Two Different Types of Parent

Soon after the medical examination in the school I saw Jackie's mother and urged her to take the boy to an eye specialist. Jackie's father is a prosperous farmer, so I felt there was nothing to prevent his having the treatment if his parents could be convinced of the necessity. The mother promised to take the child to an oculist.

Several months later I asked the teacher if the child's eyes had received treatment and was disappointed when she answered, "No." I went again to Jackie's home. This time I talked with the father and told him of the eye clinic we had recently opened. He promised to bring Jackie to our next clinic and was as good as his word. But the eye specialist found the sight in one eye almost gone, a condition which probably could have been prevented a year or so earlier.

Little Ruth's parents did not neglect the doctor's warning. Her card stated that she had diseased tonsils and advised her parents to see their family physician. At holiday time Ruth's mother took her to the hospital and a

tonsillectomy was performed. Ruth no longer is classed as a backward pupil but made her grade and stands well.

To Prevent Tuberculosis

We have had a number of our children who have been in contact with tuberculosis examined at our tuberculosis clinic. This clinic is held once a month, a specialist from the county hospital making the examinations.

Henry was a boy of sixteen in his first year of High School. During the summer and on Saturdays he worked on a farm and in this way earned enough to keep himself in clothes. The boy was tall and pale and found himself unduly tired after a day's work. He consented to go with me to the tuberculosis clinic. No organic trouble was found but the boy's run down condition was due to lack of proper nourishment. A list of necessary foods was made out and by careful selection of these Henry has improved in physical appearance, but his condition has demonstrated to us the need of serving at least one hot dish at lunch time in the schools. We hope to have this on a working basis in the fall.

The defect most common among our rural school children, concerns the care of the teeth. While many parents are awakened to the necessity of having their children's teeth cared for, many other neglect this important health measure. We hope in the near future to have a dental clinic so that every school child can have his teeth put in proper condition.

FARM BUREAU BUYS "MOVIE" OUTFIT

The Lyon County Farm Bureau is the first organization of its kind in Kansas to own and operate a complete moving picture outfit. The picture machine is operated by the Farm Bureau agent, C. L. McFadden, and the pictures can be shown any place to which a Ford car can be driven, as the agent's car has been equipped with a complete 32-volt electrical generator which furnishes power to run the picture machine.

It can also be operated by power

from any farm light plant, or from any electric plant anywhere. The machine was purchased by the Farm Bureau at a cost of around \$400. Mr. McFadden will show the pictures in every country school house, and in the small towns of the country. All sorts of farm pictures will be shown, some of the subjects being Sheep and Wool, Lambs From the Range to the Market, From Wool to Cloth, cattle, horses and hogs in various phases, poultry, dairying, plant industry, "Strawberries From Seed to Shortcake," game, scenery and recreation, industrial and humorous films. Mr. McFadden has many hundreds of films from which to choose, having access to those furnished by the United States Department of Agriculture, the Kansas Agricultural College at Manhattan, and the State Normal School at Emporia.—LAURA M. FRENCH.

WHEN BRINING CUCUMBERS

Many people complain of their inability to keep cucumbers that are put up in brine from softening and spoiling. I have never had any spoil and kept some of the first ones I put away for more than a year.

I did not put in any water to make brine. The cucumbers were cut with a short stem left on each. I did not wash those I wished to pack, but wiped away any earth that was on them with a soft cloth. They were placed in a stone jar with generous layers of salt alternating with the pickles. They make their own brine without any moisture being added. They are, of course, kept weighted down.

If pickles are wanted quickly I pour warm water over them when taken from the brine, soak, pour on cold water and allow water to heat. Repeat until salt is out as desired.—MRS. JOHN LAND.

Macaroni scramble. When you have cooked macaroni left over from dinner, mash it fine and to each 2 cups or more of it add 4 eggs. Scramble this precisely as if doing eggs alone, using a good lump of butter in the pan, and the mixture cannot be told from genuine scrambled eggs.

OUTFITTING THE SCHOOL GIRL FOR FALL

LATE summer brings home the need of getting school clothes ready and for the mother who is confronted with outgrown dresses or completely empty wardrobes, these three styles have been chosen. Notice that every one may be used for new material or a make over.

No. 9891 will just suit the "awkward age" youngster, who has suddenly shot up into the air. It is equally suitable for her college big sister and comes in sizes for both—namely, 14, 16, 18 and 20 years. For the 16-years' size use 3 yards 44-inch plaid and 1½ yards 44-inch plain material. Price 12c.

"THE Spirit of 1776" might be said to be a very jaunty one. Such a comfortable style for everyday wear! Comes in 6, 8, 10 and 12 years. Use 1¾ yards 36-inch material with 1½ yards 36-inch contrasting. Price 12c.

A SLEEVELESS jacket dress for the growing girl, No. 1674, cuts in sizes 6, 8, 10, 12 and 14 years. Size 8 requires 1¾ yards 36-inch material, with 1½ yards 36-inch bias printed material and 2½ yards skirting. Price 12c.

To Order: Write name, address, pattern numbers and sizes clearly. Check up on all these figures, then enclose correct remittance and send to Pattern Department, American Agriculturist, 461 4th Avenue, New York City.

Ready September 1: The mammoth fall and winter catalogue.—The best one we have ever published. Only 10c.—and worth many times that. Add five more two-cent stamps to your order and have it sent you after September 1st.

Egg Plant—A Nourishing Vegetable

Sandwich Preparations—A Design to Crochet

THIS delicious vegetable is in its prime in late summer, and its pulp may be transformed into many substantial, nourishing dishes, which are acceptable substitutes for meat.

There is a real art in frying the thin slices to be crisp outside, and tender but dry and firm inside.

Fried Egg Plant

Cut into quarter-inch slices, season with salt and pepper, dip into beaten egg, then cover with fine, dry, bread crumbs, and fry in deep, hot fat until a crisp, brown crust is formed. If the egg will not adhere to the slices, first press into the crumbs, then into the egg and again into the crumbs.

Baked Egg Plant

Take a young tender egg plant, peel and cut into inch cubes, put into a saucepan with a cup of boiling water, simmer ten or fifteen minutes and drain well. Fry two small onions (chopped) in butter, add the drained egg plant, a tablespoonful of salt, a tablespoonful of butter, a tablespoonful of Worcestershire sauce and a little pepper. Put all into a greased baking dish, sprinkle with bread crumbs and grated cheese. Bake about twenty minutes.

Stuffed Egg Plant

Select a medium sized egg plant, wash and dry. Cut into halves lengthwise, scoop out the meat, leaving a rind thick enough to hold its shape. Chop the meat, mix with an equal quantity of bread crumbs, a tablespoonful of melted butter, a little salt and pepper. Moisten with stock, fill the shells with the mixture, lay narrow strips of bacon on top and bake about forty minutes.

Egg Plant Croquettes

Boil an egg plant about half an hour in water to which a teaspoonful of vinegar has been added, then drain and mash. To a pint of the pulp add half a cup of flour or bread crumbs, two well-beaten eggs, salt and pepper to taste and shape into small cakes. Roll in egg and crumbs and fry in deep hot fat. Serve with tomato sauce.

Egg Plant With Cheese

Cover two medium sized egg plants with boiling water and let stand covered closely, for ten minutes. Slice a quarter of an inch thick and pare. Season with salt and pepper and fry until brown. Lay in a deep baking dish and cover each layer with grated cheese, pouring over all a good white sauce. Cover the top with bread crumbs, dot with butter and bake.

VARIETY IN SANDWICH FILLINGS

MRS. T. KNIGHT WHITEHEAD

The "main dish" of picnic boxes is the useful sandwich. I manage to make mine appetizingly different because of a plan I follow. That is, I avoid the one-kind-of-sandwich habit, both for summer lunches and in the children's boxes when school days come 'round.

Inside my cupboard door hangs a large white card listing kinds of fillings and variations for sandwiches. These were collected from various magazines, from neighbors and by thinking out original combinations for the foods I usually have on hand.

The three types listed are succulent, meat or meat substitute, and sweet sandwiches. I try to have one of each type in each lunch box. Succulent sandwiches are difficult in cold weather when lettuce, water cress, tomatoes and cucumbers are not available. For the children's boxes last winter I used cucumber pickles, pickled beets, sliced onions and watermelon pickles.

Meat or meat substitute sandwiches are usually made from supper leftovers. Cold navy or lima beans mashed to a pulp, seasoned and moistened with vinegar or salad dressing is one favorite easily prepared. Peanut butter, thinned with cream, sometimes with chopped onions, is another favorite. Creaming American cheese as I do butter, seasoning with red pepper, worcestershire sauce and cream or

with salad dressing, disguises the cheese sandwich into a dainty "main dish."

Sweet sandwiches are tasty made with tart jelly or fruit butter. Dark breads, as graham, rye or whole wheat with nuts, raisins, dates or prunes offer a variety from my list. Here are four rules which also have helped me make sandwiches tempting:

1, Cut the bread in thin slices and attractive sizes and shapes; 2, soften the butter by creaming before spreading; 3, spread butter evenly on both slices of bread. This keeps the filling from

soaking into the bread. 4, wrap each sandwich in waxed paper to prevent it drying or absorbing odors.

The Brown Mouse

(Continued from page 114)

tions" of which he was now required to "think"—and that Bonner's did not at first impress him as having anything back of it but blarney. He was to find out later, however, that the wily Con had made up his mind that the ambition of Jim to serve the rural schools

in a larger sphere might be used for the purpose of bringing to earth what he regarded as the soaring political ambitions of the Woodruff family.

To defeat the colonel in the defeat of his daughter when running for her traditionally-granted second term; to get Jim Irwin out of the Woodruff District by kicking him up-stairs into a county office; to split the forces which had defeated Mr. Bonner in his own school district; and to do these things with the very instrument used by the colonel on that sad, but glorious day of the last school election—these, to Mr. Bonner, would be diabolically fine things to do—things worthy of those Tammany politicians who from afar off had won his admiration.

Jim had scarcely taken his seat in the car, facing Jennie Woodruff and Bettina Hansen in the Pullman, when Columbus Brown, pathmaster of the road district, came down the aisle and called Jim to the smokingroom.

"Did an old fellow named Hoffman from Pottawatomie County ask you to leave us and take his school?" he asked. "Mr. Hofmyer," said Jim, "—yes, he did."

"Well," said Columbus, "I don't want to ask you to stand in your own light, but I hope you won't let him tell you off there among strangers. We're proud of you, Jim, and we don't want to lose you."

Proud of him! Sweet music to the ears! Jim blushed and stammered.

"The fact is," said Columbus, "I know that Woodruff District job hain't big enough for you any more; but we can make it bigger. If you'll stay, I believe we can pull off a deal to consolidate some of them districts, and make you boss of the whole shooting match."

"I appreciate this, Clumb," said Jim, "but I don't believe you can do it."

"Well, think of it," said Columbus. "And don't do anything till you talk with me and a few of the rest of the boys."

"Think of it" again!

Second Row—Beginning at corner, 10 s st in next 10 st, ch 5, turn, skip 4, sl st in next, turn, 11 s st under 5 ch, 3 s st in next 3 s st, ch 2, turn, tr in first of 11 st, *ch 2, skip 1, tr in next, repeat from *5 times, ch 2, skip 2 st in square, sl st in next (7 spaces in all) turn, 2 s st in sp, 1 s st on tr, repeat 6 times around scallop. 3 s st in next 3 st, ch 19, turn, skip 1 ch, 10 s st in next 10 ch, sl in next, cross to other side, 10 s st up other side, 3 s st in end, 10 s st down other side to stem, cross over, 6 s st in next 6 st, ch 5, sl st in 6th st of adjoining side of scallop, turn, 5 sl st on ch back to end of leaf, 2 s st in end st, s st in each st down to stem sl st in each of next 2 ch of stem, ch 17, sl st in 10th from needle to form ring, 3 s st, 1 d, 12 tr, 1 d, 3 s st in ring, join, cross over, 3 s st on 3 s st, 1 d on d, ch 5, sl st in middle of upper side of leaf, 5 sl st on 5 ch back to work; on the next 9 st work *3 s st, picot, repeat twice, 7 s st on next 7, join, 7 sl st down stem to leaf, ch 14, skip 1 ch, 10 s st in next 10 ch, sl st in next, cross over, 10 s st up other side, 3 s st in end, 10 s st down other side to stem, cross over, 6 s st up side, 5 ch, sl st in 4th from stem of ring, 5 sl st on 5 ch back to work, s st in each st to end of leaf, 2 s st in end, s st down other side of stem, 2 sl st in stem, 5 sl st in 5 ch to corner of square. Repeat directions for other three sides. Break thread and fasten in center of scallop of first row.

Third Row—Ch 8 for long tr, ch 6, 2 s st in 2 st at end of leaf, ch 10 s st in first picot, ch 4, 1 tr in middle picot, ch 5, tr in same picot, ch 4, s st in last picot, ch 10, 2 s st in end of leaf, ch 6, long tr (thread over 6 times), in center of scallop. Repeat on remaining three sides, joining to 8th st of 8 ch.

Fourth Row—S st in every st below, working 7 s st in the corner space.

Fifth Row—Tr, ch 1, skip 1, tr in next, all round, working 3 tr with 1 ch between in each corner.

Sixth Row—S st in every st below, working 3 s st in corner st.

The Oblong Medallion is made in the same manner as the square, omitting the flowers and leaves from two opposite sides. In the third row, join to the sides of scallops on these sides as shown in the illustration.

Insert the squares and oblongs in linen, join the strips by working like the 5th row, then work the 4th, 5th and 6th rows all round the scarf. On the ends, between the oblong, work a row of scallops, joined as shown by chain of 8, over which s sts are made.

Crochecraft, a book containing this and hundreds of other attractive designs, will be sent upon receipt of 75c. This book is invaluable to anyone who is interested in this popular form of handiwork.

Reviewing the Latest Eastern Markets and Prices

HONEY MARKET OUTLOOK

HERSCHEL H. JONES

THE latest Federal Reports on the honey crop of the country confirms previous reports as to the very light crop in practically all sections except New York. Southern California has practically no surplus flow following the orange bloom. The crop of alfalfa honey in Central California will be a failure and the bee-men are said to be discouraged. In the Pacific Northwest many colonies were killed and others will produce no surplus this year as a result of spray poison. In Texas the bees are now gathering surplus from cotton blooms, but the general outlook is for much less than normal crop. In Wisconsin, Minnesota and Indiana abnormal yield is expected, but in Ohio the clover crop is only fair and in some cases practically a failure. Dry weather in the northeastern States will generally shorten the honey crop, whereas in the southeastern States rainfall is too abundant. Sales of extracted honey in 60-pound cans in ton lots are reported in southeastern States as follows: white, 12½c, light amber 9 @ 10c and amber 7c.

Very few sales are reported from northeastern States or other sections. The New York market quoted on August 9, clover in the comb per case at \$3.50 @ 4; extracted, per lb., 9 @ 11c; buckwheat comb, per crate, \$3 @ 3.25; extracted, per lb., 10 @ 11c. Some beekeepers up-State are asking as high as 15c per lb. for light clover extracted in 60-lb. cans, but no actual sales are known at this price.

APPLE SUPPLY LIBERAL

Supplies of bushel baskets of summer apples in the New York market were very liberal last week especially from New Jersey. Shipments from the Hudson River Valley sections were not heavy. Demand was moderate for fancy large fruit, but small and ordinary stock was practically neglected and the market was generally dull and weak. Hudson River Valley apples were sold on August 9 at the following wholesale prices per bushel hamper: DUTCHESS—best, \$1 @ 1.25; some fancy large, \$1.50; ordinary, 75c. ASTRICANS, best, \$1 @ 1.25; ordinary, 50 @ 75c; poor, 25 @ 35c. TRANSPARENT, best, \$1.50 @ 1.75; fancy, large, \$2 @ 2.25; ordinary, 75 @ \$1.25; WEALTHY, \$1.25 @ 2.

BERRY RECEIPTS LIGHT

Supplies of berries at New York were very light last week and the market was dull. Hudson River Valley blackberries sold, per qt., best, 14 @ 15c, few sales 16c; small and ordinary, 10 @ 12½c.

Receipts of cherries from Western New York, however, were liberal and demand limited. MONTMORENCY from Western New York sold in the middle of the week from 60 @ 75c, but later declined to 50c per 4-qt. basket. ENGLISH MORRELOS from Western New York sold at 80 @ 90c on August 9, and from Hudson River Valley at 85 @ 90c for best.

HUDSON RIVER PEARS "IN"

Early varieties of pears are now coming into the New York market from the Hudson River Valley. Following are wholesale prices at which they sold on August 9 per bu. basket: CLAPP FAVORITE, best, \$2 @ 2.25; large stock, \$2.50 @ 2.75; small and poor, \$1.50 @ 1.75. BELLE, \$1.50 @ 1.75; FLEMISH BEAUTY, \$1.25 @ \$1.75.

PEACH SUPPLY LIBERAL

New York is quite liberally supplied with peaches at the present time from Southern New Jersey. Various early varieties of Hudson River Valley peaches were also received last week and sold mostly at 25 @ 35c per 14-qt. and 16-qt. basket.

NO TRADING IN DRIED FRUITS

There was practically no business last week in the New York market in dried fruits. Evaporated apples were quoted at 11 @ 11½c per lb. for fancy and 10 @ 10½c for choice, but there were very few sales. Early fall shipments of prime were quoted at about

9 @ 9½c f. o. b. One large dried fruit dealer in the New York market declared that not more than three carloads of evaporated apples had gone into consumption in the New York market in the last year. He considers the evaporated apple business as very near dead because of the general substitution of canned apples by restaurants and pie bakers.

POTATOES SLIGHTLY DULLER

Last week, due to warm weather and the fact that all business was suspended on Friday the market for potatoes turned dull. Long Island cobbles in 150-lb. sacks sold at from \$3.75 @ 4.50. The buyers were inclined to hold off expecting bargains.

Most of the large firms handling potatoes were well supplied with barreled stock from Maryland and the Eastern Shore and were anxious to clean up. Some barrels sold as low as \$3.40, top \$4.

Southern New Jersey was offering

egg shipper that a few hours out in the sun on a railroad platform will change the character of eggs very quickly in hot weather. Ship, if possible, in the evening so that they will reach the market the next morning.

Average extras, nearby and nearby Western hennerly whites sold at 44 @ 47c on August 9; extra firsts, 41 @ 43c; mediums, 36 @ 40c.

Hennery browns are in demand, New Jerseys selling at 44 @ 48c, and others at 38 @ 43c.

BUTTER PRICES CONTINUE HIGH

Extra creamery butter reached a firm price of 43½c per lb. last week. Wholesale dealers seemed to feel that there was a slightly weaker tendency at the end of the week, but sales of extras continued at 43½c up Friday when all businesses were closed.

Lighter production is reported generally. The American Creamery Butter Manufacturers' Association reported a decrease of 4.98 per cent in

price. June specials remain at 26 @ 26½c. There is a strong feeling on all grades of Swiss cheese. Production in New York State shows little change as yet.

Washed curd cheese is in much better demand at Boston than New York.

It is reported from Utica that cheese bought at independent factories during the week in that section was paid for at 22c, compared with 19c at the same time last year.

DRESSED CALF MARKET DULL

Although receipts of country-dressed veals were in light supply last week, demand was very dull and prices remained practically unchanged. Most sales were made from 18c down, and a few strictly choice veals were sold at 19c.

The outlook for live calves is a little brighter, and the best grades of veals sold as high as \$14. There was little demand, however, for coarse, heavy stock, and a few lots went at \$4.50 @ 5.50.

Toward the end of last week the demand for live lambs improved and the bulk of the stock in the market moved more easily. Sales were made at \$12 @ 14 for ordinary to strictly choice.

RAISES HOGS THAT PAY

Howard Fetterolf, proprietor of the Viewmount Farm, Mainville, Pa., writes as follows about his O. I. C.:

"We had 67 living pigs farrowed by six sows in the spring of 1922 and 51 living pigs farrowed by four sows this fall. Had a litter of March pigs to average 102 pounds when 100 days old, and a sow that weighed 548 when 15 months old, but these pigs got this honestly, as our Schoolmaster boar has a length of 80 inches, a heart girth of 63 inches and 11½ bone. Our Junior boar, of Wildwood strain, bids fair to develop into a larger boar still, and we had grand champion sow at Bloomsburg Fair this fall on our big 700-pound sow C. C. Perfection. We have been sold out of spring boars since September 1st, but have bred 12 spring sows which are now ready to ship. We also have a better crop of fall pigs than we have ever had."

If it is farm news, you will see it in the American Agriculturist.

"Just What We Need"

WILL you kindly send me some blank forms for your radio market service. I will try and have them posted and also keep one 'side of the phone, as all of our neighbors have telephones and I can reach them all. The service is just what we need and should prove very fine. The American Agriculturist is always in the lead.—N. W. S., Horsehead, N. Y.

carlots freely for \$3.50 per 150-lb. sack f. o. b. loading point. The best sold in New York City from \$4 @ 4.50.

BROILERS SELL WELL

Preceding the special Friday holiday last week, the demand for broilers was very active. Receipts during the week by express were not heavy. Wholesale prices August 9 as follows: Colored, 31 @ 33c; Leghorn, large, 31 @ 32; Leghorn, average, 30c; small mixed and Leghorn, 27 @ 29c.

Fowls continued in good demand, fancy colored reaching 25 @ 26, and some large Leghorns, 22c or more.

Pigeons, per pair, 30c; rabbits, per lb, 22 @ 23c; geese, 16c per lb; Long Island spring ducks, 26c.

EGGS BRING HIGHER PRICES

Nearby white eggs continued in light supply last week and cleared promptly at advanced prices. Pacific Coast eggs are only in moderate supply and fresh receipts of gathered eggs or express shipments from a distance cannot show the quality of nearbys. Really fancy quality white eggs from any nearby section will sell at 50c per dozen or more. It must be remembered by the

output last week and a loss of 11.5 per cent compared with the same week last year. The shortage in cold storage holdings in the four large cities this year compared with last had increased to 10,000,000 pounds by August 9, and was causing much anxiety among butter dealers. The Government report on holdings in the entire country on August 1, however, shows a shortage of only 2,183,000 pounds. This indicates that a relatively larger proportion of butter is being held in storage houses outside the four cities.

The average quality of the butter is better now than a few weeks ago. Danish butter is offered in some quantities at 35c per pound, with insurance and freight paid. About 2,000 to 2,500 casks were bought early last week for shipment to New York.

CHEESE SLIGHTLY STRONGER

Although wholesale quotations have remained about the same all the last week, there was a little stronger feeling to the market toward the end of the week. American cheese, State whole milk flats, fresh, average run, continue selling at 24c a pound, with insufficient supply for demand at that

Quotations From Eastern Markets

Rules For Playing Barnyard Golf

The Old Game of Pitching Horseshoes is Coming Back Into Its Own

BARNYARD GOLF, the good old game of pitching horseshoes, is coming back into its own. Whether it is because horseshoes are becoming scarcer, or folks are beginning to appreciate the good old pastimes, we do not know. We do know, however, that a great deal of interest is centered in the game to-day. It has become a part of practically every farmers' picnic, family reunion and similar functions. It has even become so popular that it is one of the official contests at town and county affairs, at which time the town or county championship is determined. American Agriculturist has received so many requests for the rules governing the game that we are printing below the rules adopted by the National League of Horseshoe and Quoits Pitchers. Additional copies of these rules may be obtained upon request.

Section I

1. The standard distance shall be 40 feet between the pegs.
2. The ground shall be as level as possible. In indoor pitching, contestants will pitch into boxes, the boxes not to exceed 6 inches in height.
3. The pitcher's box shall extend 3 feet on either side, to the rear and in front of peg. The ground therein shall consist of clay, except in those states that have a sandy soil; if clay, it shall be well dampened and dug up to a depth of 6 inches; if sand, it shall be well dampened and tramped down. A contestant, when pitching, may stand anywhere inside the pitcher's box. Any pitcher delivering a shoe outside the pitcher's box shall forfeit that pitch.
4. The pegs shall be of iron, 1 inch in diameter, perpendicular, extending 8 inches above the ground and inclined 1 inch toward the opposite peg.

Section II

1. At the beginning of the game the contestants shall toss a coin for first pitch, the winner to have his choice of first or follow.
2. At the beginning of the second game the loser of the preceding game shall have first pitch.

Section III

1. The shoes to be used must not exceed 7½ inches in length or 7 inches in width. No toe or heel calks shall be over ¼-inch in length. No opening between the heel calks shall exceed 3½ inches, inside measurement. No shoe shall exceed 2 pounds and 8 ounces (2½ pounds) in weight.

Section IV

1. In four-handed games, partners shall have the right to coach.
2. Those not in the game are forbidden to coach, molest, or in any way interfere with a pitcher.

Section V

1. No contestant shall walk across to the other peg and examine the position of the shoes before making either his first or final pitch. All contestants must pitch from the pitching box into the opposite pitching box, or forfeit a point to his opponent.

Section VI

1. Wrapping the fingers with tape is allowed.

Section VII

1. A regulation game shall consist of 50 points, and the contestant first scoring this number shall be declared the winner.
2. The most points a contestant can score in a single game is 50. A pitcher gets credit for only the necessary points required to bring his total up to 50, but all ringers are credited to him.
3. In all national tournaments regulation 50-point games shall be pitched. Each contestant shall pitch other contestants three consecutive games. The contestant winning the greatest number of games shall be declared the winner.
4. A shoe that does not remain within 8 inches of the peg shall not be counted.
5. The closest shoe to the peg shall score 1 point. If both shoes are closer than either of an opponent's, they shall score 2 points.

6. A ringer shall score 3 points. To be a ringer, a shoe must encircle the peg far enough to allow a straight rule to touch both calks, and clear the peg.

7. Two ringers is the highest score a pitcher can make and shall count 6 points.

8. All equals shall be counted as ties. That is, if both contestants have one shoe each equal distance from the peg, or against it, or ringers, they are tied, and the next closest shoe counts.

9. If one contestant should have two ringers, and the other one, the pitcher having the two ringers shall score 3 points.

10. In case of a tie on all four shoes, such as four ringers, or four shoes each 1 inch from the peg, no score shall be recorded, and the contestant who pitched the last shall be awarded the lead.

11. Calipers should be used for all necessary measurements.

12. In case of any dispute, or where

A nail-driving contest, about as exciting as and much less embarrassing than the stout ladies' race, has become a feature of farmers' picnics. It is interesting to note that all the contestants are holding their hammers after a manner peculiar to the women folks. We might suggest that in such a contest all the hammers be uniform. Compare the man-sized hammer wielded by the lady in the center, with the tack hammer in the hands of the contestant on the left. Note also the latter's position. Watch ALL your nails, girls

the rules do not specifically cover a disputed point, the referee or committee in charge shall have full jurisdiction.

A MUCH-NEEDED BOOK

Professors E. S. Savage and L. A. Maynard of the Department of Animal Husbandry of the New York State College of Agriculture, are the joint authors of "Better Dairy Farming," a book which is just off the press.

There have been books and books on the science of dairying, and particularly on feeding, but the most of them have been technical and difficult for the busy dairyman to interpret and put into actual practice. "Better Dairy Farming" was written with the practical needs of the man on the farm in mind, and in our opinion it has hit its mark so well that no dairyman should be without this book in his equipment.

We have often thought of the tremendous loss of money the farmers have suffered in the past through feeding wrong feeds and unbalanced rations that the best cow in the world could not return profit on. The number of dairymen following the hit-or-miss method of grain feeding—mostly miss—is, we are glad to say, rapidly becoming less; and the man who has had more than any one else to do in the movement of saving the farmers' money through keeping their feeding costs down is E. S. Savage, who is recognized throughout the Eastern United States as a leader in better feeding methods.

The chapters on corn and wheat and their by-products, other grains and their by-products, and the oil meals are particularly good. Other chapters give suggested rations for all kinds and conditions of cows. That part of the book telling how to buy feed is very good and will, if the advice is followed, enable any dairyman to save money in the purchase of his feeds.

The wealth of pictures and illustrations not only add to the attractiveness of "Better Dairy Farming," but contain in themselves a lot of valuable information. For instance, there is a series of pictures showing the different steps in treating a young calf's horns to prevent their growing. The book is divided into short paragraphs, with sub-heads in large print, making it easy to use as a reference book when finding any subject in a hurry.

"Better Dairy Farming" is being distributed by Farm Publications, Ithaca, N. Y., at \$2.50 a copy.

The Agricultural Situation

(Continued from page 113)

ing power of cities even with the intermittent employment, is likely to continue to average relatively high so that the ten-year average outlook for the better classes of foods, like milk

and nearby eggs, is not so unfavorable as is the outlook for grain.

"Pork also responds to wage conditions and the demand for it is good, but the supply is enormous so that the demand is not sufficient to hold prices up. CONDITIONS IN NEW YORK ARE MUCH LESS SEVERE THAN IN OTHER REGIONS."

The statement particularly warns farmers to be careful of too high expenses, to pay debts at every opportunity and to get loans on a long time basis, such as the Land Banks provide. Another important suggestion is that farmers should produce more home supplies, because farm prices are out of joint with retail food prices. "For the same reason the advantages of selling direct to the consumer are greater than usual. Only a limited number of farms can do retailing but all of them can produce more of their own food."

Every dairyman will be particularly interested in what the statement says about the dairy outlook in New York. We quote in full: "The profits from dairying are dependent on many factors. The more important are:

1. The demand for milk
2. The price of grain feed.
3. Wages.

"During the war dairying was severely depressed because of high-priced feed and low-priced milk. An inevitable reaction came and milk was profitable for about two years. The boom caused increased efforts to produce, and high production was attained just in time to meet the period of falling demand which came with the panic of 1920. The panic in the dairy industry reached bottom about a year ago. Since then there has been a gradual recovery."

New York City

This Book Brings New York to Your Door

HAVEN'T you longed, almost every season, to visit the big metropolis; to review the new styles and to take advantage of the tremendous bargains? Who hasn't? Then think of being able to enjoy the solid satisfaction of shopping to your heart's content, choosing to suit yourself from huge stocks of the latest styles.

No longer is it necessary to make a personal trip to New York, for this surprising book brings New York to you. Every page reflects the advantages of the great market in style, quality, variety and, best of all, in the lower-than-usual prices.

Seated in comfort at home; you can now shop in the style center and market center of America, choosing at leisure from among the finest that New York has to offer in up-to-the-minute, fashionable wearing apparel for every member of your family and from a general line of merchandise complete enough to supply your home or your farm.

And everything is guaranteed. When you see an illustration in the catalog and

read the description, you can believe in both implicitly, for both must pass the acid test of TRUTH.

The new edition of this splendid book is now ready. If you are an old customer you needn't be told to look for it—you will. If you are not already on our mailing list and want a catalog, use the coupon below TODAY and this fine new catalog will—Entirely Free—"Bring New York to Your Door."

Both New and Low Priced

This Bolivia Coat, with its Collar of Manchurian Wolf and lining of Satin de Chine, reflects the newer mode in women's coats for the fall and winter.

It is typical of the wide range of styles and the appealing prices that you will find all through the catalog.

See "Your Bargain Book," Page 4A—also pages 4 to 33 for other coat bargains.

The Passing of the "Hoss" Doctor — By H. E. Babcock

A Day In a Farm Home

How One Woman Budgeted Her Work, Rest and Social Service—A Radio Talk

By MRS. F. W. STILLMAN

President of the Home Bureau of New Jersey

GOOD evening, Radio friends! During these long, hot summer days many of you women who are listening to me this evening through the courtesy of the American Agriculturist and WEAF have probably thought of the farm woman with envy and wished that you, too, could have one long vacation in the country. Haven't you thought of her as being far from the heat and the rush of the city, sitting on a shady porch, enjoying a cool breeze? Of all the fresh fruit and vegetables, eggs and milk and cream that she has to serve on her table without thought of the endless bills at the end of the month? She does have the good fresh food to eat and the cool, clean air, to breathe, but she has a very busy life as well, and her summer is far from one long holiday.

Let me tell you what one farm woman really did in just one day. It was a Monday in last March that Mrs. Brown got up at 6:30, washed, brushed her hair and got dressed. She also washed and dressed her two small girls. She superintended the serving of breakfast to her family of nine—an older daughter had prepared the breakfast. They had oatmeal with cream, graham and rye bread, jam, milk and apples. After breakfast she attended to the kitchen fire, started a fire in the living room, put away the Sunday clothes and took care of the Sunday School collection money. She sent off the four children to school and then it was 8:45.

In the next hour and twenty minutes she swept up in the living room, dining room, kitchen and the two porches. She gathered the wash from upstairs, washed the breakfast dishes for nine, also the milk pails and strainer cloths, put on beans to cook, looked after the two little ones left at home, read the next week's Sunday School lesson to them and ate apples.

At 10:05 she filled the stove with wood, brought materials for dinner out of the cellar on her way from tending the heater. Then she brought into the kitchen the two tubs and a wash bench and got the water ready to wash. At 10:25 she started to wash with an electric washer a two weeks' accumulation of clothes as she had not been able to wash the week before. Unfortunately, only a very small percentage of farm women have such a modern convenience as an electric washer. Few can boast even of running water in the house.

While the washing was being done she prepared the dinner, having it ready at twelve o'clock—fried oatmeal, sweet potatoes, graham bread, jam, hot sage milk, canned peaches and apples. Three of the children came home from school to eat their dinner. At one o'clock she had the table cleared and was all through washing and rinsing the clothes in time to hang them out at 1:25.

Before doing this, however, she looked over the mail that came at noon and rested until 2:15. After her rest she put the beans in the oven to bake, made starch, starched the clothes, looked after all the fires, hung out the wash; fed and watered the chickens and cleaned off the chicken roosts before coming into the house; emptied the tubs, cleaned the washing machine and washed the dinner dishes. Then it was 4:20.

And still her day's work wasn't finished

because she must next cook mush to fry for breakfast and put potatoes in the oven for supper. She got a bed which was downstairs ready to be taken back upstairs. The children, including the high-school boy, who had returned from school by that time, took the bed upstairs and she swept and dusted the room thoroughly and put it to rights again.

Then it was six o'clock and she served supper to her family of nine—baked lima beans, baked sweet potatoes, graham and rye bread, jam, milk and canned strawberries. While the two girls washed the supper dishes she looked over the paper, made the bed that had been taken upstairs, also a crib;

A group of farm women studying the greatest of all professions—that of raising babies

undressed and got the two little girls ready for bed—had them tucked away by 8:05.

With most of her work over for the day she washed, brushed her hair and dressed, because there was to be a committee meeting at her home that evening.

The meeting was over at 10:40. She started the electric pump, another rare convenience in the average farm home, to pump water, looked after the heater and other fires for the night. Then the smallest girl fell out of bed and had to be comforted. She came downstairs again, straightened up the two rooms, wrote this report from notes and was ready for bed at 11:10.

A full day's work you will agree with me. Although this report was kept in March, Mrs. Brown's day would have been just as full in August. Indeed it might have been fuller if possible, for there is always canning and jelly making in summer in order that winter's meals may be complete with good fruits and vegetables. Do you wonder how she was able to do it all? It is quite a miracle to me, for as I read over her report, as it went into her home demonstration agent's office, I could find no word there of selfpity; I could see that though her day was full of needful work she still had time for outside interests, to be treasurer of her Sunday School and to be on community committees, and in face of all that was to be done she calmly took a real time for a rest in the afternoon.

Don't you still wonder how she was able to do it all? I think I can answer your question in part. Through her home demonstration agent and the specialists from the State extension service she has learned to budget

her time and do away with useless frills and notions.

To broaden her community life she has joined her county home bureau. What is this home bureau? It is an organization of rural women for service. It was organized in April, 1921 with the purpose of keeping its members to have first, a more satisfying home, through the installation of labor saving equipment; through the knowledge of food, so that well prepared meals are suited to the family needs; and through the knowledge of how each member of the family can be well dressed at a minimum cost; secondly, a better uniformed home through the development of better schools, of better churches and of better community centers, which have a great influence in developing the life of the home and the community; third and last, Federal and State laws for the advancement of home interests. The enforcement of laws affecting food supplies, the family health and the cost of living and to secure farther legislation when necessary toward that end.

I shall not tell you anything about the definite organization of our home bureau—the time is too short—but I want you all to hear our home bureau creed. It is a beautiful thought with which to close.

"To be cheerful; to be neighborly; to love little children and cherish their right to be well-born, well-fed and well-bred; to make our houses, homes whose influence for life's best shall radiate throughout our community:

"To be cordial to strangers, generous to our friends and helpful to every human life we touch; in short, to love our neighbor a little better than ourselves:

"To be ready always to pass along what we have learned, whether of home-making or home-keeping and quietly to teach those about us by word and action, that fine spirit of cooperation which springs from unselfish enthusiasm in our one common ideal-right living."

This is the philosophy that, like a golden thread, runs through our home bureau work, making the simplest task a link in the chain that writes our home into finer communities.

Says Duties Are World-Wide

I READ your editorial "Our Obligations of a New Day" with hearty approval of every word. Our national duties have outgrown America and are world-wide.

Had America taken a leading part in settling the "Near-East Problem" at the close of the World War, there would not have been any of the "horrors" there that have made the whole world shudder, and Asia Minor would have been a prosperous land.—L. J. DODGE, Chenango Co., N. Y.

DEAR EDITOR: Ever since you came to the editorial chair of the *Agriculturist* I have intended sending my personal congratulations and now that we have enjoyed the paper for some time under your guidance, just want to know that we think the paper is much better and that your policy of service to agriculture will make of it a factor in helping to solve some of the farmer's present problems.—MRS. E. J. C., Seneca County, N. Y.

The Passing of the "Hoss" Doctor

How Modern Veterinary Medicine Aids Farmers to Fight Cattle Diseases

By H. E. BABCOCK

FEW professions have progressed so much in recent years as that of veterinary medicine. We can all remember the old-fashioned "hoss Doctor" with his rasp and forceps and his home-made remedies. He is now distinctly of the past; a new type and a new character of man has taken his place. The doctor of veterinary medicine to-day is a well educated, well-trained man. He is what he is because of the leadership of such men as Dr. James Law and Dr. V. A. Moore, dean of the New York State Veterinary College, and because of the ideals set for him by his own organization, the New York State Veterinary Medical Society.

It is fortunate that the science of veterinary medicine has progressed as it has, for with the development of the dairy industry and the consequent increase in dairy cows kept under artificial conditions have come terrible diseases which unless controlled would sweep our land like a scourge. Contagious abortion, tuberculosis, white scours: What farmer is not familiar with these dreadful maladies in one form or another? Against them the veterinarians form the first and practically only line of defense.

Last week we told of the farmer-banker conference at Ithaca. It is too bad perhaps that the meeting of the New York State Veterinary Medical Society might not have included also a farmer-veterinarian conference. As it was, however, there were two days, July 25 and 26, full of interest to the men of the profession.

The election of officers and business session took place the first morning.

Dr. R. W. Gannett of Brooklyn, formerly vice president, was elected president; Dr. Charles S. Chase of Bay Shore was elected vice president. The secretary-treasurer, Dr. C. E. Hayden of Ithaca, and the librarian, Dr. H. J. Milks of Ithaca, were reelected.

A number of papers, too technical and scientific to report, were given, dealing largely with small-animal practice. "The Trials and Tribulations of a Veterinarian's Wife" as told by Mrs. J. L. Wilder of Akron, provided an amusing interlude. A number of clinics were held and post-mortems on cattle react-

ing to the tuberculin test were conducted by Dr. H. B. Leonard of the Federal department.

As might be expected, the control of bovine tuberculosis and the place of the practicing veterinarian in the program of the State and Federal Government constituted

This picture is taken from the June, 1875, issue of American Agriculturist. It is a good illustration to Mr. Babcock's article on this page because it shows the great advance veterinary science has made over the methods of the "Cow Doctor" of fifty years ago. The editor of the American Agriculturist in those days commented on the above picture, in part, as follows: The above picture tells its own story. The travelling cow doctor has come across a credulous, ignorant farmer who has a sick cow. Perhaps the animal has been fed on straw or cornstalks, and shows by her tight skin, her arched back, her rough coat and miserable appearance that she has been neglected. Careful nursing is all she needs. But that is too simple a remedy and the cow doctor makes the farmer believe that his cow has some dangerous disease. A pailful of filthy mixture is poured down the cow's throat and she is ordered to be fed a warm mash or some boiled oats. Some of the best hay is procured for her. By and by she recovers. Of course, the physic and the cow doctor get the credit for the cure, while the better food and care which really deserves it, gets none. If a cow dies in consequence of the dose, the result is laid to the disease, and not to the quack

a leading point of interest. Three of the four resolutions passed dealt with this subject. Since these resolutions give in the most concrete and authoritative fashion the sentiments of the veterinary profession on this important question they are reproduced here verbatim:

(1) WHEREAS, the testing of cattle with tuberculin and the accrediting of herds is proceeding very slowly, due to the restrictions which place the bulk of this work in the hands of comparatively few official veterinarians:

WHEREAS, we believe that a work of such magnitude as the eradication of bovine tuberculosis cannot

be carried to a successful conclusion without the cooperation and active participation of every approved veterinarian:

Be it Resolved by the New York State Veterinary Medical Society, in convention assembled, that the cooperation of the approved veterinarians is absolutely essential in order that the work of tuberculosis eradication may be carried to a successful conclusion, and that the laws, rules, and regulations governing tuberculosis eradication work should be so

framed or amended that accredited veterinarians may be permitted to cooperate in this important work upon the same plane as official veterinarians.

In counties where there is a Farm Bureau organization we are in favor of their carrying on a campaign of publicity and educational work, needed for the present and future success of the eradication work and will co-operate with them in so doing.

(2) WHEREAS, the prevention and control of infectious diseases of livestock is of necessity a problem for the veterinary profession, and

WHEREAS, in New York State such disease control is by law placed in the hands of the Commissioner of Farms and Markets under the immediate supervision of the Bureau of Animal Industry, and

WHEREAS, the Director of such Bureau is not a veterinarian, as is the Director of a similar Bureau in the United States Department of Agriculture; therefore, be it

Resolved, that the New York State Veterinary Medical Society, in regular session assembled, go on record as being in favor of having a competent veterinarian appointed as Director of the Bureau of Animal Industry in the State of New York; and, be it further

Resolved, that a copy of this resolution be mailed at once to the Commissioner of Farms and Markets at Albany, N. Y., and also that a copy be mailed to each Senator and Assemblyman in the State and also to each member of the Council of Farms and Markets.

(3) Be it Resolved, that this, the New York State Veterinary Medical Society, invite the Eastern States to have a Tuberculosis Eradication Conference to be held in Albany, N. Y., some time in June, 1924; and

Be it Further Resolved, that a committee from this society

be appointed by the President to confer with the Federal Bureau and the Commissioner of Agriculture of this State to perfect plans for said Conference.

The only formal paper dealing with bovine tuberculosis eradication was read by Dr. Charles S. Chase of Bay Shore. Space will not permit more than a few quotations:

"The rapid eradication of tuberculosis throughout the country would be furthered if the accredited veterinarians were put on a par with State and Federal veterinarians as to the amount of indemnity paid to owners for condemned cattle."

"The duty devolves upon the veterinary profession to inaugurate a vigorous campaign of educa-

Some Common Sense Needed

IT is reported that the American Farm Bureau Federation is likely to recommend that the immigration bars be lowered to admit foreign labor for American farms. If this be true, and if the movement succeeds, the American Farm Bureau will have done more injury to the real interests of the average American farmer than all the good the organization has ever accomplished.

All under heaven that ails agriculture at the present time is over-production. Every year sees a big jump in the production of nearly every farm product. We got in the swing during the war and we have not known how to slacken up since. The only thing that has saved us from utter ruin is the increased demand caused by the prosperity in the cities. This prosperity is not likely to last. But still we go on piling up the surplus. It makes us tired and disgusted to hear some speakers, who ought to know better, try to show that it is wrong and unpatriotic for farmers to even talk of cutting down production. The very first thing every other business in the world does when it runs into a surplus is to lay off its help and shut partly or completely down. But of course it is wrong for farmers to even think of this. We keep right on in the ruinous race of raising more farm products than the consumer wants and then we look to the government, the politicians and to our organizations to do the impossible in helping us to get our money back. Furthermore, not satisfied with the present surplus, we want to get more help and make it still bigger. So our organizations work to let in the cheap foreign labor, most of which is no good on our farms anyway.

Without question lack of farm labor has worked a real temporary hardship on a minority of our farmers, but the average farmers—who make up the great majority—work one-man farms and hire little or no help. More labor simply increases the competition that such men cannot meet even now. Even those who now do hire help will benefit in the long run by not getting it through

the better prices which will come through lessened production.

We complain about the abandoned farms, the lack of help and the high costs of production. Where in Sam Hill would all of us be if some of the farms were not abandoned and if help were cheap and plentiful? It is about time a little old-fashioned horse sense was applied to the farmer's many problems.

The Reign of King Hawkweed

DR. G. M. TWITCHELL writing recently in the "Main Farmer" says that science tells us that one of two alternatives faces the people of this nation. "It is either control of the insect pests and diseases or absolute destruction of all vegetation and that means of all life of every kind."

Dr. Twitchell carries his point further and says that the above statement applies also to many destructive weeds one of the worst of which is the orange hawkweed commonly known as and well called the devil's paint brush.

Like many another thing of evil the hawkweed is attractive. So, many years ago somebody in Europe saw that it was pretty and imported it into America. What a world of trouble that fellow let loose! Soon afterward it began to appear in the pastures and fields. Men gave little attention to it and it spread like fire. To-day one can travel in the hill lands of New England and the Middle Atlantic States and see thousands upon thousands of acres completely covered by this terrible weed. Where it comes it crowds out everything else. Hay buyers last year put an embargo on hay for many sections where this pest prevails. It is so widespread that it does no good for one man to clean it out of his farm because next year it will seed again from the neighbors' farms.

To a man who loves the old hill lands it is really a saddening sight to stand on a hill-top in the summer and see this weed covering and coloring the fields in every direction. If one was a preacher, he could draw a moral on how the devil and his agencies gain quick control in nature when good things begin to slip. The good thing in the case of the devils' paint brush is the clover. Under present conditions with low prices there is probably nothing effective to be done to control the hawkweed. But perhaps when farm conditions improve, some of the land can be reclaimed and the clover brought back by acid, phosphate, and a large use of lime.

Wheat in the Dairy Country

IT is curious how nearly everything, including farm practices, seems to travel in cycles. History repeats itself. There was a time in early days when wheat was grown on nearly all Eastern farms and on most of our many streams and creeks, there stood the grist mills, which, because of the forests, were supplied with a more regular water power than can be had at present. Our forefathers threshed the wheat out, usually with hand flails, then took it to the mill where it was ground by the miller who took his pay or toll out of the wheat itself. From this flour our grandmothers made the large wholesome loaves of homemade bread.

But with the settlement of the prairies, wheat gradually left our Eastern hill farms, although it is still grown extensively in the rolling lands of western New York and in central Pennsylvania. For a long time a patch of wheat was almost a curiosity in the Eastern dairy country. But during the last few years for some reason, probably because of the higher prices of the war, wheat has been coming back again into the East and, although the prices have declined, we believe it is here to stay.

Wheat growing in our dairy country has

many advantages, not the least of which is that it can be made to produce a high yield. It is a splendid nurse crop; in fact, a better grass seeding can be obtained, especially of clover, than with any other grain. Wheat makes excellent feed for hens. But the greatest possibilities lie in getting the home-grown wheat back on to our own tables.

The chief difficulty in doing this is the lack of wheat flower milling facilities, but we believe a little pressure on the part of farmers with the local miller with the promise of enough patronage to pay him, would encourage him to put in the necessary machinery for grinding a good wheat flour. Why is not this one way for farmers to become like their fathers, more independent, and beat the high cost of living by growing, milling and using one of the fundamental parts of their diet?

Some Gift

THE rather amusing letter which follows, shows how much farmers will miss the free seeds which Congressmen used to hand out. We are glad that this nonsense has at last been done away with.

"I hereby wish to call your attention to the good seed the government has been handing out, and no doubt paid good money for. Relatives of mine living in the city received it last spring, and having no use for it, gave it to me. I sowed it and now it turned out to be wild radish and mustard. I have been fighting them for years, and then I have them given to me. I have managed to get rid of mustard and I certainly don't want a fresh start of it."—G. W. K.

The Suit Against The I. H. C.

NEWSPAPERS recently have contained accounts of the filing of a suit by the United States Department of Justice against the International Harvester Company in an attempt to break up this corporation into smaller units.

About eleven years ago the government sued the same corporation on the charge, among others, that the company had unduly raised the price of harvesting machinery to the grave injury of the American farmer. The government lost this suit. Now in this new proceeding, the company is charged by the government with having made the prices of harvesting machinery so low that it has injured the business of its competitors.

The business of trust-busting in this country is pretty nearly a played-out game. Undoubtedly there is danger in great corporations becoming so powerful as to be injurious to small competitors and to the public in general. But these are the days of big operations and it is often only through and by the smaller concerns uniting into big ones that efficiency is obtained and the costs of production cut down.

Farmers themselves, through their cooperative associations—many of which are already doing business in this country running into millions of dollars—are coming to see that one way to cut down overhead expenses is to increase the size and volume of the business done. We do not think that the government will get much sympathy from farm people in its complaint that the International Harvester Company is selling machines at too low prices.

We succeed or we fail as we acquire good habits or bad ones; and we acquire good habits as easily as bad ones. Only those who find it out succeed in life.—HERBERT SPENCER.

* * *

What man gains by his own labor he doth treasure; but the gift of the gods he squanders as of little worth.

Comebacks on Our Editorials

Long Hours, Old Times, Abandoned Farms and Cow Problems Are Discussed

I HAVE just finished reading the article in your paper by H. L. Cosline on, "Is a Shorter Farm Day Practical?"

I think this is the most helpful article on farming that I have ever read. It expresses my sentiments exactly.

Everyone knows that in a short crop year, prices are high and a large crop year visa versa. If farmers could be made to stick together and limit production, crops could always be sold above cost.

All farmers are complaining of the labor shortage and high wages, Why? Because, labor works shorter hours; therefore, it takes more men to do a given amount of work.

Most farmers talk against Samuel Gompers, but if farmers had a leader to help them as he has helped labor, there would be no necessity for selling out to-day.

During the depression following the war, factories began to curtail production; Why? Because if more articles were manufactured than could be readily absorbed by consumers they, on account of competition, might have had to be sold below cost of production. Not so farmers, oh no. If they had no cash to buy seed and fertilizer they would borrow, and plant as much as possible then sell, for the price made by the amount of crops produced.

There are criticisms in the papers every day that the reason farmers do not make money is because they are poor bookkeepers. I have yet to talk to any farmer of my acquaintance, but what can tell me within a very few dollars the cost of producing a crop. He knows what he should get to sell it. He may ask that price but; to sell, he must take the price put upon it by the amount of that crop on the market at the time he wishes to sell his crop.

Some farmers can produce crops cheaper than others, as some coal mines can produce coal cheaper than other mines, but; the retail price of coal is the same to all consumers.

No laborer works for anything less than a living wage. No matter if he is a fast worker or slow. In his particular line of work the wage is the same. A farmer works himself and sometimes his family, to the limit of their strength, and then, takes the price for the product, which is made by the amount of crops produced.

No grocer would buy a dollar's worth of produce and sell it for less than a dollar and a quarter; except of course a few purchases to clean up on a Saturday; but, the farmer produces produce to the cost of a dollar, and sells it for the price he can get at the market, which price, is made by the amount of the produce to be sold that day.

It is said, the man who caused two blades of grass to grow where one had grown before was a wonderful benefactor to the community. I think he is to the consumer, but not to the producer.—K. M. WYCKOFF, New Jersey.

By A. A. READERS

which should be now reproduced in moving pictures. Where could a cartoonist find material more suitable than from your old files, such as the "Tim Bunker Papers" with the Squire, and Sally Seth Twingo, and Jake Frink.

Mr. Van Wagenen, in making his bow to us reader folk some months ago, referred to walks and talks on the farm from your old files. Your present files now in the making will become old and, we hope, as grand as their predecessors.—W. D. ROWAN, Pennsylvania.

What Is Your Opinion?

I WAS very much interested in an editorial in the issue of July 21, "The Deserted Village" with over 20,000 abandoned farms in one State and more being left every year. The question how to stem the tide is a vital one to us all. The increased cost of living affects the farmer as well as the other man—so do the taxes. How are we to adjust the farmer's income to these other things and make farming pay? Milk \$1.90 for June and \$6 a day for haying help, don't look well together. It is a study.

I am a pooler and believe that if the farmers win they will have to pull together, but what inducement is there for the farmer to pull at all when he has for example an investment of from \$10,000 to \$20,000 in farm stock and tools and is at the mercy of the milk trust or commission man to set the price on his produce? What can he do with pool milk at \$1.81½?

To make my story short, I would like to ask a question. In an emergency our Gov-

ernment made a price on wheat. It was a vital matter in time of war. Do not the thousands of abandoned farms in our State make a question vital enough for our earnest consideration, even in times of peace?

If our Government could so act on wheat, why could not our Government or our State pass a law making the minimum price received by the farmer for his milk during the year not less than \$3 per hundred for 3 per cent milk? This would be only two-thirds as much as they received during the war, 1917-19. And I know the farmers prospered then and I know the country merchant prospered too, for the same conditions affected both.

To-day the country merchant is suffering for lack of business. And I know if our State or Government would do something really substantial like this in the interests of the farmers, committees would not have to stand long and scratch their heads for an idea to solve the abandoned farm problem. Of course, the question would arise, there would be so much milk produced and the market flooded and then what? I do not think that possible for a long time. For the tendency of our young farmer is from the farm to the city or larger town and it would take some time for the pendulum to swing the other way. I would like your opinion.—R. FITCH, Delaware County, N. Y.

How We Used to Keep Cows

IN your issue of July 7th I read with much interest Mr. Van Wagenen's article on the dairymen's present troubles. He set forth very fairly both sides of the subject to bring forth the experience of other dairymen. I noticed the editors' invitation also and I truly give you my experience.

Sixty-five years ago I began general farming. For many years I kept from fifteen to twenty-five cows for buttermaking. I never lost a cow by disease. Never had a case of TB or abortion or one that did not breed. In those days we knew nothing of these diseases. Our cows were stabled in ordinary sided barns with the haymow overhead and a large mow hole to pitch the hay down through, which served as an excellent ventilator to carry the impure air through the shingle roofs. Our barnyards usually had two large open sheds facing the south and kept well bedded with straw. Our cows were turned after their morning meal in the yard for water and exercise and to breathe God's pure air and to bathe in his warm sunshine. They were left out if the weather was fair until the noon hour when they had their midday meal and again returned to the yard. We in this way grew our breeding stock to maturity with good strong healthy bodies capable of great service in the dairy and better able to resist the various diseases of their kind. We in those days gave each cow a two-months rest by carefully drying her off from milking after which she had full rations to get strong and take on flesh for the best milking period and to bring forth a good strong progeny for the next generation. And now in concluding I believe some of our

PROHIBITION BALLOT

OF THE

AMERICAN AGRICULTURIST

Are You for the Strict Enforcement of the
18th Amendment as It Now Stands?

☐ YES

☐ NO

Are You for a Modification of the 18th
Amendment to Permit Light Wines
and Beer?

☐ YES

☐ NO

Designate your opinion by placing an X in the square opposite Yes or No on each question. Sign your name and address. Your name will be kept *strictly confidential*.

Name.....

Address.....

Why You Should Vote

Do the American people want prohibition? The Wets emphatically say "No" and the Drys are even more emphatically for it. Both sides claim a majority. Which is right? What do farm people think about it? The opinions of farmers on any problem, if they will express them, go far in determining the outcome of a controversy.

American Agriculturist is taking a vote of farm families on the question of prohibition. It is a vital issue and whether you are for it or against it, be sure to vote in the spaces above. Mail this ballot to the American Agriculturist, 461 Fourth Avenue, New York City.

Get your friends to vote—More ballots furnished on application

Vegetable Growers to Meet at Buffalo

National Association Meeting an Opportunity to Eastern Vegetable Growers

JUDGING from past experience, the forthcoming meeting of the Vegetable Growers' Association of America, which will be held at the Hotel Statler, Buffalo, N. Y., September 17-20, will find market gardeners, greenhouse men, and truckers in attendance from twenty-five to thirty of the States of the Union. The men who attend such meetings are

PAUL WORK

the top-notchers of the industry—the growers who are up-to-date and successful—the ones to whom the rank and file look for leadership. To have such a national gathering within easy reach of all the eastern garden centers is a real privilege.

The program for this year is without question the best on record, centering as it does about a few great subjects of interest to all, and enlisting some of the strongest leaders of the country. The head-line topics are as follows:

The Program

Tuesday morning—Good Seed, with A. B. Clark, President of the American Seed Trade Association, to present the seedman's side and several growers to tell of their needs. R. H. Garrahan of Kingston, Pa., will discuss the seed problem of the commercial vegetable grower.

Tuesday afternoon—Types, varieties and strains, with George Starr, seed grower leading the discussion. Dr. J. C. Walker of the Bureau of Plant Industry will have for his subject, "Seed Treatment as Crop Insurance."

Wednesday—tour of vegetable growing sections about Buffalo. This is of special interest because Erie County is meeting modern conditions by using more land, more machinery, more fertilizer and more green crops. The latter part of the afternoon is to be given over to a demonstration of labor-saving devices at which at least ten makes of garden tractors are expected, as well as vegetable washers, tiers, and other helps for these days of labor shortage.

Thursday forenoon is to be devoted largely to Association business—particularly to the development of advertising plans which have already been nicely started, and the perfecting of plans for affiliation of State and local associations in the national.

Sapiro Speaks on the 20th

Thursday afternoon will be the session of outstanding interest of the week. Aaron Sapiro, best known of authorities on cooperation, is to lead the discussion of marketing, while others will take up the details of both distant and local selling.

Cooperation for distant marketing—"What the Southern Produce Co. has done and how"—is the subject of C. W. Banks, Manager of the Southern Produce Co., Norfolk, Va. This is the cooperation that handles the Norfolk products.

Cooperation for local marketing—"What the Providence Market Gardeners' Association has done and how"—by E. J. Locke, Manager, Providence, R. I.

Thursday p. m. Policies of the American Farm Bureau Federation, President, O. E. Bradfute, Chicago, Ill.

The session adjourns Thursday evening, but provision is being made for several tours among garden sections during Friday. One party will visit the Irondequoit greenhouse and garden district near Rochester, another will take in the mucklands at Elba, and a third will make stops along the South Shore grape, berry, and canning belt from Buffalo to Dunkirk. Other parties will be arranged as there is demand.

The general public is not to be neglected at Buffalo. On Tuesday evening there is to be a popular program on the food value of vegetables. Gardeners will be there to learn the points that

By PAUL WORK

the public should learn about the things we produce. Bob Adams, gardener and rhymester, is to open the evening. Dr. R. A. Dutcher of Penn State, a student of the vitamins and other nutrition questions, will explain why vegetables are needed in the diet and just what they have to offer. Miss Flora Thurston, of Cornell will then point out some of the delicious, but often neglected possibilities in the preparation and serving of vegetable foods.

Judging Tourney a Feature

Another new feature at Buffalo will be a vegetable judging tourney on Tuesday afternoon. It is to begin with a formal judging match, open to gardeners and students under twenty-eight, for which L. H. Vaughan of Chicago, has offered a pair of beautiful medals, specially designed for the occasion. Afterward score cards will be furnished all who wish to try a hand and later the correct answers, as determined by a board of judges, will be announced. The contest is to cover eight classes of four to six plates each, and some fifty specimens to identify.

This feature is expected to mark the beginning of a movement which will do much to bring about uniform judging standards among the hundreds of shows and fairs in the country.

Already reports of touring parties for Buffalo are coming in. It is hard to find a good time for a meeting when crops are growing, but mid-September seems to fit best of all, coming after the heavy rush of August and before cleaning up and storing for fall. Ohio and New York will likely send the largest delegations, but New Jersey has promised twelve motor loads at least. Buffalo is at the gateway between East and West, for rail, boat and highway, and the officers are figuring on not less than a thousand.

Hotel accommodations in Buffalo are of the best. The Statler is brand new and as good as is, with moderate rates besides. Then there is the Ford, with 700 rooms in a modern fireproof building and at somewhat lower rates, beside the dozens of others, all of them ready to do their share.

LAWS PERTAINING TO KEEPING ROADSIDES CLEAN

American Agriculturist has repeatedly had some inquiries as to the laws in different States requiring the cutting of weeds and brush along highways. We have obtained the facts from the different State Departments of Agriculture, which are as follows:

Secretary Alva Agee of the New Jersey Department of Agriculture writes:

"The law provides that it shall be the duty of the overseers of the highways of the several townships of this State to remove or cause to be removed, during the months of August and September of each year, the briars, thistles, and weeds growing on the highways of their respective districts, and to clear out and open all gutters, drains and ditches along or across said roads within their respective limits and divisions, or so much thereof each year as may be determined upon by the legal voters of their respective districts at the annual road meeting."

In Pennsylvania, there is no law requiring the cutting of brush and weeds along public highways. There is a law, however, on the Canada Thistle which has been amended so as to include Chickory. It provides that the owners of land where Canada Thistle or Chickory is growing so as to become a nuisance can be compelled to eradicate these weeds or to pay for officers who do the work.

In New York State, there is a rather radical law in regard to the keeping of the highways clear of brush and weeds. A portion of this law reads as follows:

"It shall be the duty of the owner or occupant of lands situated along the highway to cut and remove the noxious weeds growing within the bounds of the highway, fronting such lands, at least twice in each year, once in the month of June, and once in the month of August. It shall be the duty of

such owner or occupant to cut and remove all brush and briars growing within the bounds of the highway, fronting such lands, once in the month of August in each year.

The law provides that if the owner of the land neglects to keep the highways clear himself, officers of the law may do it and charge the expense to the land owner.

There are farms cut up to such an extent with roads running through them that the work of removing weeds and briars each year is a considerable factor. This is especially true when labor is so scarce.

COMBATING BEAN WEEVILS AND SQUASH BUGS

Can you tell me what causes soy beans to become infested with little brown bugs? The bugs are on the inside of the beans. How can they be combatted?—E. H. S., Pennsylvania.

Beans when stored in a warm place often become infested with the common bean weevil. This insect attacks beans in the field during the summer and in the fall follows the dried beans to the house and attacks them in storage. The weevil lays its tiny eggs on the beans, where they hatch and the small white grub knows its way into the bean and lives there until it becomes grown. The grubs devour nearly all of the contents of the beans and when grown change to the weevils, each one of which emerges from the bean through a small round hole.

The weevils can usually be kept away from the beans if the latter are placed at once when thrashed in tight jars or tins with very tightly fitting covers. If the beans are left in bags or loose containers they will have to be fumigated once in a while with carbon bisulphide. In this event the beans should be placed in a tight box and a half teacupful of carbon bisulphide to each bushel should be poured on the seeds. The box should then be covered over the top with several old blankets to make it tight and to hold the fumes in. The beans should be allowed to stand three or four days to give time for the gas to do its work. Carbon bisulphide is inflammable and explosive and no light or fire of any kind should be brought near the box while fumigation is going on. Matches, lighted candles, lanterns, lamps, pipes, cigars, and similar agencies of fire should never be brought near carbon bisulphide.

CONTROLLING THE ROSE CHAFER

An insect, that is a new one to us, is attacking our grapes. It seems to sting the fruit.—J. J. A., New York.

In view of the fact that you have not described the insect that is attacking your grape vines it is quite impossible to absolutely identify it and recommend a remedy. Undoubtedly, however, it is the common rose chafer. You can verify this by closely examining one of the insects and comparing it to the description that we give here.

The rose chafer is about the size of a lightning bug. It has spreading, scrawny legs that seem to be very sharp and angular. The wing coats are striped black and yellow. It is a very slow-flying insect. They give one a most miserable sensation when they alight on the arm or neck. They are commonly found in rose blooms.

It is quite useless to try to combat this insect with an ordinary application of Paris green or arsenate of lead. This is due to the fact that the insect is particularly resistant to ordinary poisons. Contact sprays such as tobacco dust, nicotine sulphate, have no effect upon it. Some growers have been successful by adding molasses or sugar to the arsenate of lead, which sweetens the poisons and induces the insect to consume such a great deal of the spray that it often has the desired effect.

One of the best remedies that we have ever seen, at least in a small vineyard, is to cover it with netting so at least the upper half of the arbor is covered. It is the peculiar habit of the insect to fly down upon the grape vines rather than to approach them from below. Obviously this is impractical where arbors are extensive.

Long News Made Short

THE papers still contain long discussions on the wheat situation. Great pressure has been brought by representatives from the Western States upon President Coolidge to call an extra session of Congress to devise ways and means of helping the wheat growers. As the President cannot see how Congress could help the situation, were he to call it, he has announced that an extra session will not be convened at the present time.

* * *

Conditions in Europe are getting worse constantly. The great unrest and dissatisfaction in Germany have forced the Prime Minister or Chancellor Cuno, to resign, with his entire cabinet, and Chancellor Stresemann has been appointed in his place. Misunderstanding is continually increasing between England and France as to the policy of forcing Germany to pay the reparations. Newspapers report that there is now grave danger of a complete German smash with consequent ruin and chaos in most of Central Europe.

* * *

The present agreement between the anthracite coal miners and the operators of the mines ceases on September 1. For weeks representatives of each side have been trying to make a new agreement, but so far without result. The Government is taking an active hand in trying to bring about an understanding and there are indications that if such understanding cannot be reached the Government may interfere to prevent a strike. In the meantime, the safe policy is to get your winter's coal into the cellar, if you possibly can.

* * *

Poultry culling demonstrations are now going on in hundreds of farm communities. This is the time of year when it is easy to tell the slacker hen, whose board bill keeps down the profit in poultry. Your F. Bureau agent will, on request, be glad to tell you how to cull out the unprofitable hen. Some of the points to look for are given on page 135 of this issue.

* * *

Among the very effective State laws passed at the recent legislative session was one by the State of Pennsylvania requiring that condensed skimmed milk when sold in hermetically sealed cans or receptacles must be in cans holding five pounds or more, properly labeled with the name of the contents and a caution that this commodity is "unfit for infants." This is a supplement to the Jones' Filled Milk Law passed by the Pennsylvania Legislature. The Illinois Legislature passed the filled milk and truthful advertising laws in its closing days. This law makes it difficult to sell condensed skimmed milk to consumers who think they are buying the real article.

* * *

As the time for the World's Dairy Congress and National Dairy Show approaches, preparations are increasing for making this session the greatest gathering of dairy interests that the world has ever seen. The exposition is to be held at Syracuse October 5-13. Thousands of dairymen throughout the East are planning to visit this exposition.

* * *

The New Jersey State College of Agriculture is advising New Jersey dairymen to lay in their fall and winter supply of dairy and poultry feeds at the present time. The statement says: "In the late summer and early fall the feed market is usually dull and feeds can be bought at the lowest figure of any time during the year."

* * *

Most sections of the East will remember the season of 1923 as one of the driest on record. (This statement refers to the weather, not to prohibition.) Nearly all crops have been seriously hurt, but the effects of the drought in Southern New York, New Jersey, and Long Island have been the worst. The potato crop of Long Island has been greatly injured.

* * *

A recent statement, by the United States Department of Agriculture says: "Farm sentiment is mixed, with the South and East in a better frame of mind than the Corn Belt. The Wheat Belt is the sore spot."

The Plant of the American Milling Company at Peoria, Illinois

G. L. F. Public Formula Rations are mixed in this mammoth plant under the supervision of G. L. F. inspectors. Its great capacity, its modern machinery and its expert staff of operators make it without question the most economically operated feed plant in the world. Unlimited and low cost service is available to G. L. F. patrons in the assembling, mixing and shipping of G. L. F. Public Formula Rations.

Hoffman's Seed Wheats

Seed-wheat from crops of 35 to 44 bu. per acre is offered to you—such seed will pay!

Clean seed—graded right—no cockle, rye, garlic or other weeds in it. Priced low.

Stop the Loss on Your Wheat-crop!

You will grow wheat again, even if the price is way down. But you don't have to lose money on it—even at the low price! Today you can start toward a profit on your next crop—this ad points the way. Success can be yours—don't pass it by.

While growing wheat anyway, won't an extra 6 or 8 or 10 or more bushels-per-acre—pay you better than 'letting well-enough alone'? Of course it will! Then why not get them—because they cost you almost nothing! One Ohio customer realized \$125 extra profit on an \$8 investment.

The extra hundred or two bushels you will grow, will have no effect on the Country's supply—but what a difference they will make in your bank-account!

Just because so many others are taking their loss, complaining, yet making no effort to better it—don't you be! But for your own sake, let us tell you more of how Hoffman's Wheats will stop the loss on your wheat-crop. They have shown new profits to hosts of growers for 24 years—they will show you a profit next harvest!

New Catalog and Samples FREE

Seven varieties—smooth-chaff and bearded—including the famous "Leap's Prolific" and "Pennsylvania 44"—are offered. Every kind proven reliable by many years' actual use. Every bushel strictly clean—graded to perfection—free from all weeds... Offered at low prices that will surprise you... Mail your address today—mention this paper. You can't afford to continue losing money on your wheat-crop.

Pool Price For July Milk \$2.08

New York Fruit Growers Contract With Federated—New York County Notes

THE Dairymen's League Co-Operative Association, Inc., announces that the gross pool price for the month of July is \$2.08. This is .08 greater than the pool price for June. From this gross pool price of \$2.08 there will be deducted .09½ for expenses of demonstration and advertising, leaving a net pool price of \$1.98½. From the net pool price, the Association has deducted 15 cents per 100 pounds, which is borrowed on the certificates of indebtedness, leaving a cash pool price of \$1.93½.

The July price for 1923 is the highest July price realized since the pool was organized. The net pool price of \$1.98½ is 36½ cents greater than the price realized in 1922 and 28½ cents greater than the July price of 1921.

Class 1 Up to 30 Cents August 16

The League has also announced that the wholesale price to dealers buying milk in class 1 will be raised on August 16, to \$2.73 per 100, which is an increase of 30 cents over the price set on August 1 of \$2.43. The reasons for this advance are the conditions in the producing territory. Due to lack of rain, poor pasturage has resulted and the cows have not yielded a normal output.

League Farmers Receive Certificates

The League is mailing to its members certificates of indebtedness aggregating \$4,622,579.76. This amount represents loans by members to the Association during the past fiscal year for the erection of milk plants, and as working capital. The certificates bear 6 per cent interest and are payable in equal instalments each year for a period of 5 years.

The rate of deductions from milk checks during the past fiscal year was \$1.3760654 per 100 pounds of milk as compared with a rate of \$1.6791134 per 100 pounds for the fiscal year ending March 31, 1922, when the deductions amounted to \$4,307,727.48.

The decrease in the rate is accounted for in part by the fact that during the past fiscal year the Association marketed about one billion pounds more milk than it marketed during the previous year, although the number of actual poolers was not as large as in 1921 and 1922.

Where the deductions from the farmers' milk check amount to less than a dollar, a check for the amount will be mailed instead of a certificate of indebtedness.

FRUIT GROWERS' CONTRACT WITH FEDERATED

The finest fruit markets of the country were made available to the products of New York orchards recently when the Western New York Fruit Growers' Cooperative Packing Association contracted for the sales service of the Federated Fruit and Vegetable Growers, Inc. The Western New York growers have had the advantage of a national market for some time; their contract with the Federated gives them the added benefit of a grower owned and controlled sales service with salesmen in over two hundred markets.

The Federated Fruit and Vegetable Growers, Inc., was organized early in January of this year by a national committee of fruit and vegetable growers appointed some time ago by the American Farm Bureau Federation to study fruit marketing. The committee took over the entire organization of the North American Fruit Exchange which had been operating in a private way as a national organization and transformed it into a grower owned and grower controlled cooperative association to operate at cost and without profit for the growers' cooperatives which desire to use it. In this way the experience and judgment of a service which has been in operation for more than ten years was secured. Since January growers' organizations in almost every State in the Union have taken membership in the Federated, giving it a total volume or tonnage which will make it probably the largest

and most influential distributor of fruits and vegetables in the country.

Confidence in the Federated was voted by the Board of Representatives of the Western New York Association last January, but the matter of joining the Federated was left with the Board of Directors. Since that time a committee of the Board has made a thorough study and investigation of the Federated and at its last meeting voted to use its sales service.

It is expected that about 3,000 cars of fruit from Western New York will be marketed through the Federated Fruit and Vegetable Growers, Inc. Last year the association sold 3,600 cars of fruit for 800 members. Apples were shipped steadily from October 7, until the first week in May; the movement did not vary more than 10 cars from the shipment of 70 cars per week throughout the entire seven month's period.

Other large growers' associations which are members of the Federated include the Maine Potato Growers' Exchange, The California Mutual Orange Distributors, The Georgia Watermelon Association, The Mississippi Truck Growers' Association, The New Jersey Fruit Growers' Exchange and The Michigan Grape Association. Organized fruit and vegetable growers throughout the country have made considerable progress during the past year in a co-ordinated movement to market their fruit along national commodity lines.

NEW YORK COUNTY NOTES

Ontario Co.—July was a very hot and dry month. The temperature reached nearly 100 in the shade on many days. At present we are in need of a good rain. Beans, potatoes, and garden truck are suffering from the dry weather. Those farmers who are plowing for wheat find no moisture in the turned furrow slice. Barley and oats are being harvested at this time and are making a good crop. Corn is earing up nicely. Some farmers have sold mixed hay for \$14 a ton. The weather is very hot and sultry.—E. T. B.

Wyoming Co.—Hay harvest is practically over in this section. The crop was better than usual. Oats are not yielding as well, due to the dry weather. In fact, everything is greatly in need of rain. Potatoes and beans are fair. Potatoes are selling at \$2; butter, 45c; good broilers bring 25c a pound; eggs, 30 to 35c. Raspberries and black caps have been light through the season, bringing anywhere from 25 to 30c a quart.—L. M. F.

Along the Southern Tier

Haying is well advanced. Some meadows that have been well fed and cared for have produced record crops. Others have been light and weedy. The crop estimate has been placed conservatively throughout this section at from seventy to seventy-five per cent or a normal yield. Good timothy hay brings around \$20 on the Binghamton market.

The oat crop is being harvested at present. Late rains have much improved this crop. Little threshing has been done so far.

New seeding which had been somewhat damaged by the prolonged dry weather has been helped wonderfully by the rains of July and August. Old meadows have started up, too, very nicely.

Potatoes that were planted early will be low producers this year. The drought of May, June and the fore part of July greatly curtailed the crop. Late planted pieces bid fair to be better. There is about an average acreage in this locality.

Many pastures which had been shortened by dry weather are coming on better now, but the milk flow will not come back to normal this year. Some have disposed of their cows. Other dairies have been greatly depleted through the tuberculin testing which has been in progress here since the first of the year. Many herds have

been practically wiped out by the test. As yet, little disposition has been shown to replace extinguished dairies. The price of milk works against such a rebuilding of the dairy industry.

The purchase by the Dairymen's League of the Empire State Dairy plant at or near Windsor is considered as a marked victory for the poolers. Other similar purchases are in contemplation.

The retail price of milk advanced in Binghamton August first to 14 cents a quart, due in part to a similar advance to producers.

The interests of the G. L. F. Exchange are being actively promoted in this part of the State.—E. L. V.

WESTERN NEW YORK NOTES

Fruit growers in Western New York are much interested in the activities of the International Apple Shippers' Association in attempting to better the shipping conditions. Secretary R. G. Phillips, of Rochester, states that the discriminatory rates, unfair freight charges, excessive icing costs, perishable protective tariffs, express floatage charges and a number of related subjects have been placed before the Interstate Commerce Commission and similar State bodies with intra-State jurisdiction.

Hay Growers Adopt Federal Grades

The Seneca County Hay Growers' Association has adopted the grades and standards of grading recently established by the United States Department of Agriculture. Heretofore, hay has been bought and sold according to grades established by dealers in the several States with no definite standards as a basis. Each buyer or dealer of hay had his own standards and no one could tell definitely or even know just why hay should be called by the various standard numbers of grade.

Fruit Growers' Notes

The Keuka Lake Grape Growers' Association has entered into an agreement with the American Fruit Growers' Pittsburgh branch, for the marketing of the 1923 crop. The Penn Yan Fruit Growers' Cooperative Association, Inc., composed of some of the largest growers in that section, is planning to erect a building on the property purchased near the Pennsylvania tracks in Penn Yan. Additional land will be leased from the railroad company and a switch installed. It was also recently announced from Penn Yan that the growers of Stanley, Flint and Hall would erect a cold storage plant at Flint with a capacity of 50,000 barrels at a cost of over \$150,000. Directors for the first year are: T. D. Whitney, E. W. Ferguson, Abram Post, John Hutchinson and Frank Carr.

Oswego Lettuce Crop Heavy

Better prices for Oswego county lettuce is in prospect as a result of a new method of distribution through chain stores in New York. In over 1,500 stores of one company the lettuce was introduced at a special price of three heads for ten cents. The chain store concern makes no profit at this figure, but the customers are urged to call for Oswego lettuce and a trade developed. Two carloads daily are being moved at this special price by this one concern. The second week the concern places the price at a figure which will show some profit from the venture, after a demand has been fully established.

All in all the lettuce growers have had a poor season with both weather and over production conspiring against them. In a number of instances the growers have only received from 25 to 75 cents a crate for their product, a price that does not cover the cost of crates and fertilizer. From the Fulton district the forwardings often ran as high as 20 to 25 carloads daily. Some growers are about at the point of turning the crop under the soil for its fertilizer value. Of the two varieties, Romaine and Boston head, the Romaine has in most instances sold for more money than the other.

Among the Farmers Of Pennsylvania, New Jersey, and Maryland

PENNSYLVANIA farmers are confronted with a large, but unprofitable crop of wheat, the present selling price being below cost of production. At Grange gatherings and other farmers' meetings this subject is much discussed.

Discouraging reports as to the Thanksgiving Day supply of turkeys come from farming sections, the early spring season having been very unfavorable for "poults." Weather conditions and disease wiped out early-hatched spring broods completely.

Eastern Pennsylvania has an immense crop of elderberries and thousands of gallons of home-made elderberry wine is assured. Many farmers' families regard it as an excellent remedy for various illness, such as incipient colds.

The bee farm of L. H. Swartz, near Manchester, York County, was flooded during a recent heavy rainfall, causing a loss of bees, hives, and honey valued at \$3,000. The apiary was carried away by the high water.—OLIVER D. SHOCK.

CENTRAL PENNSYLVANIA NOTES

J. N. GLOVER

The heavy rain on the 3rd, with a few showers since, have made it difficult to dry oats properly to store it, but farmers are busy at it and it will soon all be stored. Reports are that they are yielding better than was anticipated. Pastures have grown well since the heavy rain, when six inches of water fell during the night.

Late potatoes and corn are doing well now, and some second crop hay may be made later, if the present growth of clover continues. Dairy men are buying feeds with which to balance their cow rations this winter, so several carloads of cotton and oil meal have been sold in a few townships of Union County, in addition to cars of mixed feeds.

Candidates for county offices are plenty and they are very busy. Some school boards have trouble to get coal for the winter, so a few townships will try soft coal for a change, at a saving of a few hundred dollars. Schools will open August 27 and September 3 in a few townships. New and inexperienced teachers are plenty, but good teachers and with experience are not plentiful. One auctioneer has 110 farm sales booked for next spring in this and Snyder County. Apples and plums are better crops than was expected earlier. Apples sell from 75c to \$1.25 a bushel. New wheat and old corn are each selling at 95c a bushel, an unusual occurrence.

PENNSYLVANIA COUNTY NOTES

Tioga Co.—A general rain throughout this section during the first week in August saved the corn and potato crops. Corn never looked better. Hay turned out to be a better crop than was expected at first. Pastures are short. The apple crop will be light and apples will be small. Roads in this section are very poor for this time of the year. Eggs, 25c a dozen; potatoes, \$2; red and black berries, 20c a quart.—MRS. W. C. G.

Berks Co.—More wheat than ever is being threshed from the fields this year, but there apparently is no market for it. The sixty-seven-days' drought was partially broken on July 28 by a two-inch rainfall. During the dry period less than one-half inch of rain fell and all crops, pastures, and fruits suffered heavily. Pastures and grass in stubble fields are completely burnt out. Not much of the oats crop was harvested this year for more than most of it was cut and cured for hay or pastured from the fields. The hay crop is the lightest this year for half a century, yielding about 25 per cent of normal. This leaves dairy men short of roughage and consequently many have reduced their herds. Corn may produce a fair crop, fodder is short. The early potato crop was light in yield and of poor quality. Orchards have been

rather severely hit with an unusually severe attack of caterpillars. In view of the present conditions, farmers seem to be inclined to shift to small farms. This movement is undoubtedly caused by the labor shortage and also owing to continued falling prices for farm products and rising prices for those things farmers buy.—E. R. DYSSER.

Fayette Co.—It has been raining here for most of the time. Early apples have been fed to the hogs as there is no sale for them. It is a long time since we have had such a glut of apples. Peaches and other fruit are plentiful. Wheat, oats, and hay harvest is out of the question until this wet spell is over.—E. W.

Washington Co.—The weather was very dry during June and July. However, we have had fine rains during the past week. Corn is looking fine. Wheat is being threshed and marketed at 95 cents a bushel, which is very discouraging to farmers. Apples and peaches are going to market, not in large quantities. Berries about over with. They brought fair prices. Corn, 90c a bushel; eggs, 32c; butter, 35c.—D. J. W.

NEW JERSEY DROUGHT BROKEN

Salem Co.—It is now a week (August 4) since the drought was broken. A blessing is pouring from heaven on mother earth and her children; the pastures and meadows are growing up green again. Corn and garden truck are responding nicely. Late potatoes are coming through very well. Some farmers are availing themselves of the changed conditions and are plowing considerably. Some alfalfa and vetch was sown during this period. Since lima beans dropped considerably in price on the New York market, some farmers have stopped picking them, awaiting better prices.—S. B.

HARVEST WINDING UP IN MARYLAND

Farmers are rounding up harvest operations with varied results as to yields and quality. The weather during the early or first half of the season was ideal for haymaking, the past three weeks has been less favorable though not bad. The work has been long drawn out on account of the scarcity and high cost of labor. The hay crop is probably 25 per cent less than last year, both clover and timothy headed short and much white-top weeds and garlic infested many fields. Wheat that has been threshed is yielding from 15 to 40 bushels to the acre and is of good color and plumpness of grain. There is a big acreage of corn and bright prospects for a bumper crop. Plowing for wheat has begun. Tomatoes and sugar corn are showing up good at this stage of the season and canners are hopeful for a large pack. The milk situation is still in an unsatisfactory state as regards to price and tests at the creameries. High costs of feed stuff and the sanitary laws are reducing profits to the farmers. Cows are ranging in price from \$50 to \$125, calves 9c per pound. Hogs rather plentiful with slow demand at about 8c per pound, six week old pigs from \$3.50 to \$10 per pair. The hatch of young chicks and turkeys has been large, but many are dying from different causes. Old chickens 23c per pound, L. W. spring broilers 35c pound. All crops and pastures need rain.—C. R. H., Maryland.

Comebacks on Our Editorials

(Continued from page 125)

dairy men are feeding too large a portion of silage for a well-balanced ration, but should feed more of the different clovers, well cured, and of the different roots, as sugar beets, carrots, and turnips. I hope that I may help Mr. Van Wagenen in rousing the present-day dairy men to a closer study of these troubles to bring about a reform.

The Genius of Man Has Created Marvels in Farm Machinery

TWO continuous miles of farm and dairy machinery will be displayed at the 1923 National Dairy Exposition. This great exhibit will contain new and improved cream separators, milking machines, barn equipment, churns, and a thousand and one other articles to lighten labor and increase profits on the dairy farm. Here in a few days the ambitious dairy farmer will be able to learn more about labor saving machinery than he could learn in a lifetime in any other way. An unusual opportunity to combine business with pleasure.

CONVENTIONS, MEETINGS AND CONFERENCES

During Exposition week conventions will be held by the National Milk Producers' Federation, all of the National Cattle, American Dairy Science, International Association of Milk Dealers, National Creamery Buttermakers and many others.

Here you will meet face to face, the leaders of all branches of dairying and can without cost secure the benefit of their experience in your business, from building a cattle barn to equipping a creamery.

COME—FOR PLEASURE AND FOR PROFIT

NATIONAL DAIRY EXPOSITION

SYRACUSE, N. Y., October 5th to 13th, 1923

You Can Get A Unadilla Silo At Once!

You can mail, 'phone or wire your order for a Unadilla Silo. It will be loaded the same day on railroad car and shipped. From then on our traffic department follows the Silo to its destination to assure prompt delivery.

There's plenty of time to order a silo, have it shipped, erected and filled on time—if you order a Unadilla. We are prepared with Spruce and Oregon Fir and metal fixtures to serve all late buyers. No need to waste good corn or put off getting a Silo until next year. You can get yours now. You take no chance if you order a Unadilla.

POST YOUR FARM and Keep Trespassers Off

We have printed on linen lined board trespass notices that comply in all respects to the new law of New York State. We unreservedly advise land owners to post their farms. We have a large supply of these notices and will send one dozen to any subscriber for 60 cents. Larger quantities at same rate. Address:

AMERICAN AGRICULTURIST
461 4th Ave., New York City

SILOS

I have a chance to sell by mail at my usual LOW PRICES the output of a well-known silo concern. Silos absolutely first-class, made of genuine CLEAR FIR. This lumber is high-priced and hard to get this year but YOU KNOW it is the ONLY SAFE wood for silos. If you buy DIRECT FROM THE FACTORY you can BUY THE BEST and PAY LESS. Your neighbor probably bought at my sale last year. Ask him how much he saved. This sale lasts 30 days.

The Passing of the "Hoss" Doctor

(Continued from page 123)

tion and create a demand for healthy tuberculosis-free herds, and that demand should be so strong that Congress and the Legislature will be compelled to respond by appropriating more generously in the future than has been done in the past for this work."

The last statement was made by Dr. Chase following a discussion of the fact that, as he understood it, the Bureau of Animal Industry at Washington and the New York State officials in Albany were handicapped by lack of funds and therefore unable to permit payment of indemnities on tests by accredited veterinarians.

In conclusion Dr. Chase stated: "It is the purpose of the Tuberculosis Eradication drive to clean up area after area and ultimately to produce absolutely clean herds. The only way this can be done satisfactorily is to have it done harmoniously as possible with all possible speed compatible with efficient work. A perfect understanding between all parties concerned will facilitate the ultimatum. Let us all work to the accomplishment of that end. If the accredited veterinarian is accorded the consideration that the importance of the part he takes warrants, the work will progress more satisfactorily and the end be more rapidly achieved."

Dr. V. A. Moore, Dean of the New York State Veterinary College, read a learned and interesting paper on diseases of animals communicable to man, with special reference to those transmitted through milk.

"A study of the infectious diseases of animals," said Dr. Moore, "shows that certain of them, such as anthrax, rabies, and foot and mouth diseases, are infectious for practically all species of warm-blooded animals. Others, like tuberculosis, glanders, and cowpox, are communicable to a few species only. There are a number of inflammatory conditions in animals due to pyogenic bacteria that will cause disease in man if opportunity is afforded. Infections of this kind are not infrequent."

"The diseases of animals that have caused the greatest amount of human infection are, presumably, anthrax and rabies. Since the discovery of their causes and their modes of infection they have been of much less significance than they were before, although anthrax still remains a cause of many deaths in man. Cruickshank reported in London about 500 deaths annually from it. Graham reported 48 cases treated in New York City from 1915 to 1918 inclusive; of these, 23 recovered and 25 died. Hubbard and Jacobson reported 34 cases in the same city in 1919 and 1920, of which 23 recovered and 11 died. The higher mortality in the former group is explained by the fact that serum was not used in the treatment."

"Rabies, that at one time was such a scourge, especially in Europe, is transmitted through the bites of infected animals, usually dogs. As the virus extends from the wound to the brain through the nerves, the deeper the bite and the more the laceration, the greater the danger of infection. The preventive treatment renders it possible to save most people who are bitten. In 1908-09 there were examined at the college 588 specimens of suspected rabies; of these 295 were positive. Last year 57 specimens were submitted for examination, and but 14 were positive. In recent years the cases of human rabies have been very few and these among people who have not taken the treatment."

Speaking of human infection through milk from tubercular cows, Dr. Moore stated that the fact has been established that young children are susceptible to bovine tubercle bacteria, and that this infection usually takes place through the ingestion of infected milk.

"In reference to the frequency with which these bacteria are found in market milk," Dr. Moore said, "there is a scarcity of data of recent date. Formerly a number of investigations indicated that they were quite numerous. For example, in 1906 Anderson examined 233 samples of market milk in Washington and found tubercle bacteria in 6.72 per cent. Campbell, in 1908, found 13.8 per cent of 130 samples of raw milk to contain these or-

ganisms. He also found that one out of twelve samples sold as pasteurized milk contained virulent tubercle bacteria.

"A large number of examinations have been made of the milk from individual tuberculous cows. M'Fadyean and Woodhead found the milk from fourteen out of nineteen tuberculous udders contained the organism. Two out of thirteen cases were positive when the udder was not affected."

"In 1907 we made a series of examinations to ascertain how frequently tubercle bacteria appeared, first in the milk of herds containing reacting animals, and secondly to what extent reacting cows with sound udders were eliminating the organisms. The results showed that of forty-nine samples of mixed milk, acid-fast bacteria resembling those of tuberculosis were found microscopically in one specimen and guinea pigs inoculated with the mixed milk from two herds which contained advanced cases of tuberculosis developed the disease."

The preliminary examinations mentioned were followed by a very thorough study by Peterson on the elimination of tubercle bacteria in the milk and excreta of reacting cows which exhibited no evidence of disease. The examinations were reported frequently over a period of several months to ascertain whether or not in such animals the specific organisms were eliminated intermittently. The milk of nine reacting cows was examined both microscopically and by guinea pig inoculation. The conclusion he drew from these studies are:

1. The tuberculous cattle that were examined that were apparently sound but which reacted to the tuberculin test, did not eliminate sufficient tubercle bacilli to cause the death of experimental animals when injected with their milk or excreta, or for the same to be demonstrated microscopically.

2. The animals that showed marked physical signs of tuberculosis eliminated tubercle bacilli in sufficient numbers to be detected microscopically or by animal inoculation in the large percentage of samples of milk and excreta taken at regular intervals. A significant fact brought out in this work was that while many of these samples did not contain the organisms so long as lesions did not appear in the udder and there was no evidence of lung infection that when the cows developed pulmonary lesions tubercle bacteria appeared in their sputum and their feces contained the organism in sufficient numbers to kill guinea pigs infected with them. We have found very small tubercles discharging into the bronchials and also into the trachea. This shows the possibility of tubercle bacteria gaining access to the milk of cows suffering with pulmonary or intestinal tuberculosis and whose udders are not infected."

The Brown Mouse—By Herbert Quick

A FINE home-coming it was for Jim, with the colonel waiting at the station with a double sleigh, and the chance to ride into the snowy country in the same seat with Jennie—a chance which was blighted by the colonel's placing of Jennie, Bettina and Nils Hansen in the broad rear seat, and Jim in front with himself. A fine ride, just the same, over fine roads, and past fine farmsteads snuggled into their rectangular wrappings of trees set out in the old pioneer days. The colonel would not allow him to get out and walk when he could really have reached home more quickly by doing so; no, he set the Hansens down at their door, took Jennie home, and then drove merrily to the humble cabin of the rather excited young schoolmaster.

"Did you make any deal with those people down in the western part of the State?" asked the colonel. "Jennie wrote me that you've got an offer."

"No," said Jim, and he told the colonel about the proposal of Mr. Hofmyer.

"Well," said the colonel, "in my capacity of wild-eyed reformer, I've made up my mind that the first four miles in the trip is to make the rural teacher's job a bigger job. It's got to be a man's size, woman's size job, or we can't get real men and real women to stay in the work."

"I think that's a statesmanlike formulation of it," said Jim.

"Well," said the colonel, "don't turn down the Pottawatomie County job until we have a chance to see what we can do. I'll get some kind of a meeting together, and what I want you to do is to use this offer as a club over this helpless school district. What we need is to be held up. Do the Jesse James act, Jim!"

"I can't, Colonel!"

"Yes, you can, too. Will you try it?"

"I want to treat everybody fairly," said Jim, "including Mr. Hofmyer. I don't know what to do, hardly."

"Well, I'll get the meeting together," said the colonel, "and in the meantime, think of what I've said."

A NOTHER thing to think of! Jim rushed into the house and surprised his mother, who had expected him to arrive after a slow walk from town through the snow. Jim caught her in his arms, from which she was released a moment later, flustered and blushing.

"Why, James," said she, "you seem excited. What's happened?"

"Nothing, mother," he replied, "except that I believe there's just a possibility of my being a success in the world!"

"My boy, my boy!" said she, laying her hand on his arm, "if you were to die to-night, you'd die the greatest success any boy ever was—if your mother is any judge."

Jim kissed her, and went up to his attic to change his clothes. Inside the waistcoat was a worn envelope, which he carefully opened, and took from it a letter much creased from many foldings. It was the old letter from Jennie, written when the comical mistake had been made of making him the teacher of the Woodruff school. It still contained her rather fussy cautions about being "too original," and the sage statement that "the wheel runs easiest in the beaten track." It was written before the vexation and trouble he had caused her; but he did not read the advice, nor think of the coolness which had come between them—he read only the sentence in which Jennie had told of her father's interest in Jim's success, ending with the underscored words, "I'm for you, too."

"I wonder," said Jim, as he went out to do the evening's tasks, "I wonder if she is for me!"

CHAPTER XXI

A SCHOOL DISTRICT HELD UP

YOUNG MCGEEHEE SIMMS was loitering along the snowy way to the schoolhouse bearing a brightly scoured tin pail two-thirds full of water. He had been allowed to act as Water Superintendent of the Woodruff School as a reward of merit—said merit being an essay on which he received credit in both language and geography on "Harvesting Wheat in the Tennessee Mountains." This had been of vast interest to the school in view of the fact that the Simmses were the only pupils in the school who had ever seen in use that supposedly-obsolete harvesting implement, the cradle. Buddy's essay had been passed over to the class in United States history as the evidence of an eyewitness concerning farming conditions in our grandfathers' times.

The surnameless Pete, Colonel Woodruff's hired man, halted Buddy at the door.

"Mr. Simms, I believe?" he said.

"I reckon you must be lookin' for my brother, Raymond, suh," said Buddy.

"I am a-lookin'," said Pete impressively, "for Mr. McGeehee Simms."

"That's me," said Buddy; "but I hain't been doin' nothin' wrong, suh!"

"I have a message here," said Pete, "for Professor James E. Irwin. He's what-ho within, there, ain't he?"

"He's inside, I reckon," said Buddy.

"Then will you be so kind and condescendin' as to stoop so low as to jump so high as to give him this letter?" asked Pete.

Buddy took the letter and was considering his reply to this remarkable speech, when Pete, gravely saluting, passed on.

"Please come to the meeting to-night," ran the colonel's note to Jim; "and when you come, come prepared to hold the district up. If we can't meet the Pottawatomie County standard of wages, we ought to lose you. Everybody will be there. Come late, so you won't hear yourself talked about—I should recommend nine-thirty and war-paint."

It was a crisis, no doubt of that; and the responsibility rather sickened Jim. How could he impose conditions on the whole school district? And how could any one look for anything but scorn for the upstart field-hand from these men who had for so many years made him the butt of their good-natured but none the less contemptuous ridicule? Only one thing kept him from dodging the whole issue and remaining at home—the colonel's matter-of-fact assumption that Jim had become master of the situation. How could he flee, when this old soldier was fighting so valiantly for him in the trenches? So Jim went to the meeting.

THE season was nearing spring, and it was a mild thawing night. The windows of the schoolhouse were filled with heads, evidencing the presence of a crowd of almost unprecedented size, and the sashes had been thrown up for ventilation and coolness. As Jim climbed the back fence of the schoolyard, he heard a burst of applause, from which he judged that some speaker had just finished his remarks. There was silence when he came along-

side the window at the right of the chairman's desk, a silence broken by the voice of Old Man Simms, saying "Mistah Chairman!"

"The chair," said the voice of Ezra Bronson, "recognizes Mr. Simms."

Jim halted in indecision. There is no rule of manners or morals, however, forbidding eavesdropping during the proceedings of a public meeting—and anyhow, he felt rather shiveringly curious about these deliberations. Therefore he listened to the first and last public speech of Old Man Simms.

"Ah ain't no speaker," said Old Man Simms, "but Ah cain't set here and be quiet an' go home an' face my ole woman an' my boys an' gyuhls without sayin' a word fo' the best friend any family evah had, Mr. Jim Irwin." (Applause.) "Gentlemen, we-all owe everything to Mr. Jim Irwin! Maybe Ah'll be thought forrard to speak hyah, bein' as Ah ain't no learnin' an' some may think Ah don't pay no taxes; but it will be overlooked, Ah reckon, seein' as how we've took the Blanchard farm, a hundred an' sixty acres, for five yeahs, an' move in a week from Saturday. We pay taxes in our rent, Ah reckon, an' howsomever that may be, Ah've come to feel that you-all won't think hard of me if Ah speak what we-uns feels so strong about Mr. Jim Irwin?"

OLD Man Simms finished this exordium with the rising inflection, which denoted a direct question as to his status in the meeting. "Go on!" "You've got as good a right as any one!" "You're all right, old man!" Such exclamations as these came to Jim's ears, with scarcely less gratefulness than to those of Old Man Simms—who stammered and went on.

"Ah thank you-all kindly. Gentlemen an' ladies, when Mr. Jim Irwin found us, we was scandalous pore, an' we was wuss'n pore—we was low-down." (Cries of "No—No!") "Yes, we was, becuz what's respectable in the mountings is one thing, whar all the folks is pore, but when a man gets in a new place, he's got to lift himse'f up to what folks does where he's come to, or he'll fall to the bottom of what there is in that there community. In the mountings we was good people, becuz we done the best we could an' the best any one done; but hyah, we was low-down people becuz we hated the people that had mo' learnin', mo' land, mo' money, an' mo' friends than what we had. My children was igerant, an' triffin', but I was the most triffin' of all. Ah'll leave it to Colonel Woodruff if I was good fer a plug of terbacker, or a bakin' of flour at any sto' in the county. Was I, Colonel? Wasn't I perfectly wuthless an' triffin'?"

There was a ripple of laughter, in the midst of which the colonel's voice was heard saying, "I guess you were, Mr. Simms, I guess you were, but—"

"Thankee," said Old Man Simms, as if the colonel had given a really valuable testimonial to his character. "I sho' was! Thankee kindly! An' now, what am I good fer? Cain't I get anything I want at the stores? Cain't I git a little money at the bank, if I got to have it?"

"You're just as good as any man in the district," said the colonel. "You don't ask for more than you can pay, and you can get all you ask."

"Thankee," said Mr. Simms gravely. "What Ah tell you-all is right, ladies and gentlemen. An' what has made the change in we-uns, ladies and gentlemen? It's the wuk of Mr. Jim Irwin with my boy Raymond, the best boy any man evah hed, and my gyuhl, Calista, an' Buddy, an' Jinnie, an' with me an' my ole woman. He showed us how to get a toe-holt into this new kentry. He done showed us that you-all is good people, an' not what we thought you was. Outen what he learned in school, my boy Raymond an' me made as good crops as we could last summer, an' done right much wuk outside. We got

WHAT HAS HAPPENED

GRADUALLY the tide is turning Jim's way. It has been a long, uphill pull for the inexperienced young teacher, facing the opposition of the school board and even of his old sweetheart, Jennie Woodruff, now county superintendent.

But bit by bit, Jim's successful application of his "work related to life" school program has made friends. The shiftless Simms family, southern newcomers, has been rehabilitated, Newton Bronson, formerly a village problem, has found work more fun than idleness and, finally, Jim's trip to the Agricultural College to speak at Farmer's Week has shown the community that he was to be taken seriously. During that trip he receives a flattering offer to teach in another county. He agrees to "think it over."

the name of bein' good farmers an' good wukkers, an' when Mr. Blanchard moved to town, he said he was glad to give us his fine farm for five years. Instid o' hidin' out from the Hobdays that was laywayin' us in the mountings, we'll be livin' in a house with two chimneys an' a swimmin' tub made outen crock'ryware. (Applause.) "Ah could affo'd to pay Mr. Jim Irwin's salary mysr'f, if Ah could. An' there's enough men hyah to-night that say they've been money—he'pd by his teachin' the school to make up mo' than his wages. Let's not let Mr. Jim Irwin go, neighbors! Let's not let him go!"

Jim's heart sank. Surely the case was desperate which could call forth such a forlornhope charge as that of Old Man Simms—a performance on Mr. Simms' part which warmed Jim's soul. "There isn't a man in that meeting," said he to himself, as he walked to the schoolhouse door, "possessed of the greatness of spirit of Old Man Simms. If he's a fair sample of the people of the mountains, they are of the stuff of which great nations are made—if they only are given a chance!"

Colonel Woodruff was on his feet as Jim made his way through the crowd about the door.

"Mr. Irwin is here, ladies and gentlemen," said he, "and I move that we hear from him as to what we can do to meet the offer of our friends in Pottawatomie County; but before I yield the floor, I want to say that this meeting has been worth while just to have been the occasion of our all becoming better acquainted with our friend and neighbor, Mr. Simms. Whatever may have been the lack of understanding, on our part, of his qualities, they were all cleared up by that speech of his—the best I have ever heard in this neighborhood."

More applause, in the midst of which (Continued on page 135)

Old Man Simms Says His Say

Summertime Hospitality

Drinks That Satisfy, Tasty Salads, Party Cakes—Kate Dickinson Sweetser on "Popularity"

PERHAPS to many would-be hospitable housewives, suggestions for porch parties may be interesting. The most indispensable aid to successful porch luncheons is the tea cart. On it several courses can be conveyed to the porch and served directly from the cart, buffet style. But a tea cart is by no means a requisite. The food can be arranged on large trays and served from a table. Paper napkins, and even paper dishes may be found more desirable on some occasions, as they lessen work.

Dainty service, piquancy of contrast in flavors and colors, herein lies the charm and secret of giving zest to the jaded summer appetite. Ice cold and crisp salads, delicious fruit drinks, dainty sandwiches, and cakes, these are the joys of the summertime guests.

Drinks That Satisfy

Grape Nectar.—One pint of grape juice, two of lemon, one of orange, one small cupful of sugar, one pint of water, a pinch of nutmeg and a few sprigs of mint. Bruise the mint leaves and add to the grape juice, lemon, orange, sugar, water and nutmeg. Let stand for one hour or two for the flavors to blend. Strain and serve in tall glasses with a quantity of crushed ice.

Pineapple Lemonade.—Make a syrup by boiling one pint of water, and one cupful of sugar for ten minutes. Add the juice of three lemons, and one chopped pineapple. Cool, strain, and add one quart of ice water.

Mint Drink.—Pour one cupful of boiling water over five or six sprigs of mint and let stand ten minutes. Boil together, one cupful of sugar and one cupful of water until it forms a thick syrup. Combine the two and add the juice of four lemons, and half a cupful of currant juice. Pour in a pitcher with a quantity of cracked ice and add one pint of charged water. In the mouth of the pitcher put a bunch of fresh mint which has been lightly dipped in the beaten white of an egg and then in powdered sugar.

Plum Amber.—Whip to a froth a half glass of plum jelly and mix slowly with one cupful of boiling water. Strain and when cool add a bit of nutmeg and one quart of loganberry juice. This may be garnished with the stiffly beaten white of an egg, which makes a pleasing color contrast.

Fruit Punch.—Boil one cupful of water with two cupfuls of sugar, until it threads and add one cupful of strong tea. Let cool, add two cupfuls of blackberry juice, juice of four lemons, juice of six oranges, and one chopped pineapple. Let stand for several hours. Just before serving add two or three sliced bananas, one cupful of preserved

or fresh chopped cherries, one quart of water, and two bottles of soda water.

Ice Coffee With Whipped Cream.—Make a quart of strong black coffee, strain and allow to cool. Add one-half cupful of sugar, one-half teaspoonful of almond extract and two cupfuls of iced milk. Serve in long slender glasses containing a little cracked ice. Top with whipped cream which has been tinted with crushed cherries.

Cold Chocolate.—To make the chocolate syrup, mix half a cupful of choco-

side of the banana with this mixture and cover with the other half. Cut the banana in halves again lengthwise, at right angles to the first cut. Spread with the remaining cheese mixture and press the halves together firmly and cut the bananas in slices crosswise. Place the slices on lettuce leaves and serve with French dressing.

Afternoon Salad.—On a lettuce leaf, place a large slice of tomato, mix an equal quantity of cooked chopped corn, and chopped green peppers. Cover the

on a lettuce leaf, and top with a bit of mayonnaise dressing.

Sandwiches that are Different

Layer Sandwiches.—Alternate six layers of white and graham bread, and spread between each a mixture of chopped dates, raisins and nuts. Trim evenly, put under a weight and let stand for several hours, then cut crosswise in thin slices. Arrange on a plate overlapping one another.

Cream Cheese Sandwiches.—Mash a cream cheese and moisten with enough cream to make it spread. Add one-fourth the quantity of finely chopped olives and season with salt and paprika. Spread on thinly sliced white bread and cut in fancy shapes.

Fancy Sandwiches.—Put cold boiled ham through a meat chopper, moisten with cream and season with mustard and cayenne. Spread between slices of buttered bread. Serve with an eighth of a pickle cut lengthwise and laid across the top.

Cakes for Party

Afternoon Drop Cakes.—A scant two-thirds cupful of shortening, one-half cupful of sugar, one cupful of honey, two eggs, one tablespoonful of lemon juice, three cupfuls of flour, and three teaspoonfuls of baking powder. Cream the shortening and sugar, add honey, beaten egg yolks, and lemon juice. Mix well and add sifted flour and baking powder. Fold in the beaten whites of eggs. Drop on greased pans and bake in a moderate oven twenty-five to thirty minutes. Ice with white frosting.

Peanut Crisps.—Any unsweetened wafer cracker may be used in a variety of ways for afternoon teas. Spread with peach marmalade or fruit filling, they make a dainty sweet, spread with cheese or peanut butter and bake in a hot oven until delicately browned, they are delightful little crisps to accompany salads or fruit drinks.—H. A. LYMAN.

THE JUICY CURRANT

Comparatively few farm gardens contain currants, but every garden should, for delicious and healthful dishes are derived from them. Nothing quite equals the currant as an accompaniment for cold meat, whether in the form of the jelly, jam, or fresh fruit. Some of the best ways of serving them are given below:

Currant Jam

Equal weights of fruit and sugar cooked until fruit bursts. Then skim out fruit and cook syrup until it jellies slightly. Add fruit, heat thoroughly and put in jars. Much cooking hardens the seeds of currants.

Fresh Currants

Equal parts of fruit and sugar. Crush fruit, being sure each currant is broken, otherwise it will not keep. Add sugar and mix thoroughly. Put in jars excluding bubbles. Seal. This is delicious in winter with cold meat.

Spiced Currants

5 lbs. fruit, 5 lbs. sugar, pint of vinegar, tablespoon of ground cloves, 2 of cinnamon. Cook until fruit breaks, skim out and cook liquid until it jellies. Add fruit and put in glasses.

Currant Puffs (Dessert)

2 tablespoons baking powder sifted in 1 pt. flour. Add 1 beaten egg and little salt. Mix with sweet milk to a smooth batter. Put in buttered cups—part batter and part fruit. Steam twenty minutes. Serve with sweet sauce.

Preserved White Currants

Equal parts fruit and sugar by weight. Put a layer of currants in bowl and sprinkle with sugar. Continue until all are used then stand aside for 2 or 3 hours. Then put in an earthen or enameled kettle, bring slowly to a boil; simmer and skim until the currants are clear and the syrup thick. Lift carefully with a spoon, put into glasses and set aside to cool.—MRS. GEORGE GRAY.

POPULARITY: HOW TO ACHIEVE IT

KATE DICKINSON SWEETSER

It is an elusive thing—popularity. It crops out where you least expect it

HAVEN'T you often heard the remark, "She is perfectly stunning—I wonder why she isn't popular? or, "My, but she is clever. I don't see why people don't like her better." We have all met persons who seemed to have every mark of popularity and yet just missed it. I wonder why?

Even the dictionary doesn't help us much. It defines popularity as "a state of being widely trusted or admired," which is all very well as far as it goes, but it does not go far enough.

"Widely trusted or admired," says the dictionary, and I suspect the secret of that quality which we are all eager to possess lies buried somewhere under that definition.

There are almost as many kinds of popularity as there are of golden rod, and it might be a good idea to line up some of the girls you know who are popular in different ways, and note what their characteristics are, and which you would like to imitate.

There is Amy. Sweet, dainty Amy. All the girls and older women adore her. The boys don't know her. She is shy and self-conscious with them and treats them like creatures who have no place in the world of real flesh and blood. Amy is a "girl's girl." She is all that is charming and unselfish and lovable, but she does not go far enough. To like the boys, to have intimate friends among them is as normal to a healthy girl as breathing.

Elsie, with her black eyes and bobbed black hair, her reddened lips and kalsomined nose which put Dame Nature to the blush for the paleness of her tints, is as different from Amy as possible. She is never backward in coming forward when a boy shows one degree of admiration—not she! She is a "man's girl" and proud of it. Girls only interest her when there is nothing masculine available. And I am sorry to say that the Elsie I have known will sometimes stoop to mean acts to further their own ends. Wearing a gown of a shade that kills her rival's fainter one, a careless hint of the rival's reported engagement to another man, a suggested flaw in the other girl's character—these are a few of the faults in the girl who cares to be admired only by men. No, that kind of popularity is no more sane or balanced than is Amy's.

But Betty—now you are talking! Betty likes boys, and they like her, but they know she will not tolerate any nonsense. There is no use in trying to put petting parties over on her—it simply can't be done. On the other hand, she is a "peachy" dancer, and a tireless one when the jazz is good and her partner responsive. She likes picnics and hikes, even when one is dirty and tired before the end of the party. Betty likes girls of course, and they make her the confidante of their most sacred secret because she won't tell, and because she cares. She likes older people, too, and will listen patiently while an elderly lady tells her how much she is like her grandmother at her age. Her sense of humor enlivens even the gloom of a dinner party of difficult relatives. In fact, Betty is an all-round good sport, and hers is the kind of popularity that appeals to me, that has underlying it the coveted secret, as well as the proof that the dictionary definition is right.

And the most important word in the definition is the word "widely." Popularity that is confined to any one set or sex is not worth imitating, but being "widely" liked is.

Be a pal of the boys, a chum of the girls, a friend of the older generation. Cultivate kindness, and a real desire to bring out the best in others, with no thought of winning interest, sympathy or admiration for yourself, and you will have the essentials of worth-while and lasting popularity. And it is for you if you really want it.

late or cocoa, with two cupfuls of sugar, then add gradually one cupful of boiling water and cook in the upper part of a double boiler for ten minutes. Place the syrup in a small glass jar and keep in the refrigerator. To serve, place a little cracked ice in a glass, add two tablespoonfuls of the chocolate, one cupful of cold milk, little cream.

Summer Salads

Pimento Cheese and Banana Salad.—Remove skin from bananas, scrape to remove fibers, which is the indigestible part, and cut in halves lengthwise. Mix pimento cheese and chopped nuts with enough salad dressing to make it spread, add a pinch of salt. Spread one

tomato with a layer of this mixture and garnish with mayonnaise. Another variation is to use chopped celery with the peppers and pour over all a French dressing, instead of the mayonnaise.

Wheel Salad.—Place a slice of pineapple on a lettuce leaf. In the center place a ball of cream cheese blended with a little peanut butter. Cover the pineapple with mayonnaise and sprinkle with chopped peanuts. From the cheese ball to the outer edge place five or six strips rather narrow of pimento.

Jellied Chicken Salad.—A quick way to make a jellied chicken salad is to take a pint of chicken soup, and add to it one envelope of gelatine. Dissolve the gelatine in a little cold water. Pour off about a cupful of the liquid from the soup and heat to boiling point, add the gelatine and stir until dissolved. When it begins to set, mix with the chicken soup to which has been added a little salt and a teaspoonful of vinegar. When this begins to set, mix well, and pour into a baking powder can and set on the ice. When ready to serve turn out of molds, and slice. Place each slice

A Typical Meeting of an Active Club

Dress Patterns For the Kiddies Who Soon Start For School—Fall Catalog Ready

RECENTLY a friend took me to the monthly meeting of the Good Cheer Club, which has done much for their small, but very up-to-date and enterprising community.

The program for the afternoon was as follows:

Roll Call. "Housecleaning hints." Discussion. "Gardening and Flowers adapted to this Country."

Music. (Arranged by Mrs. N.) Covered dish dinner in Grain Growers' Hall.

The first item on the program had a lively interest. One member told how she made her own dustless dusters. She preferred black cheesecloth, or an old black stocking, which is soft and leaves no lint. This she dipped in boiling water, wringing it out well. Then it was dipped in a mixture of one part turpentine and one part boiled linseed oil and wrung dry. When not in use the duster should be kept in a tightly closed tin can.

A second hint was to varnish the linoleum so that dust and grease would not adhere to it. This makes the floor easy to clean with the dust mop.

Then some of the women brought up their special problems. One woman wanted to know the best method for treating old floors. Hers were not in good enough condition to have them stained and varnished in natural color, so it was suggested that she use linseed oil on the cracks and then fill them with putty, after which the surface could be painted in brown or gray as near the natural wood color as possible.

Another member planning on new window drapes wanted to know if it was correct to use figured hangings with figured wall paper. It was decided that it had seldom been done successfully, and plain hangings were advised.

One member was in doubt about using paper borders for a room, and it was agreed that unless a room was eight feet high a border should be avoided. Borders, especially when wide, have the effect of lowering the ceiling. A continuous paper to the ceiling or a simple finish of molding

where walls and ceiling meet would solve the low room problem.

How best to clean enamels and paint was next discussed. For the former hot water had been found best. This dissolves grease, frees dirt and does not harm the gloss, while soap does. For painted woodwork the best results had been obtained by the use of a cloth well wrung out of light suds made by white soap. Soap if applied directly had been found to soften and dull the surface of paint.

The paper on gardening called forth just as interesting discussions. After the music, the school children and the men folks came in for a social time and to do justice to the covered dishes and fragrant coffee.

Yes, it takes an afternoon a month of a woman's time—but it is well worth it. Because of its informality, one can take the "littlest ones"—and the rest of the family are disposed of by school and farm work, "till long about supper-time," when all the neighborhood gets together, thanks to the Good Cheer Home maker's Club.—ETTA BOIES RANKIN.

FRIENDS-BY-MAIL WANTED

Up in New York State there is a young girl who is anxious to make some new friends by mail. She writes that her mother is dead and her two sisters are married, and that she has recently moved from her old home to a place where she is not so well acquainted.

She writes a clear hand and an interesting letter and I hope that some of our younger readers in their old teens or early twenties will be interested to get acquainted with this American Agriculturist niece. Address A. P., Care of

Reviewing the Latest Eastern Markets and Prices

NEW FRUIT CROP ESTIMATES

HERSCHEL H. JONES

THE report on crop forecasts of apples and pears in New York State issued by the State Department of Farms and Markets, August 11, indicates a lower production than was estimated a month ago. The drop during July was greater than expected. The present prospects indicate a crop of 27,000,000 bushels of apples, or about an average crop compared with 36,000,000 bushels last year. The production of summer and fall varieties of apples will be considerably less than last year and slightly less than usual. Fall and early winter varieties will make up 21 per cent of the entire crop and winter varieties, 72 per cent. This is a larger percentage for winter varieties than usual.

The decrease of nearly 8,000,000 barrels in the crop of apples this year compared with last is more than offset by increases in other commercial apple States. The total commercial apple crop for the country is now estimated at 32,877,000 bushels, compared with 30,955,000 bushels last year. There are very small increases in the crop in Pennsylvania, Virginia, and Michigan, and considerable increases in production in the northwest over last year. The following are estimated 1923 crops of commercial crops of apples in New England States: Vermont, 127,000 bbls.; New Hampshire, 198,000 bbls.; Massachusetts, 480,000 bbls.; Rhode Island, 24,000 bbls.; Connecticut, 128,000 bbls.; Maine 643,000 bbls. All the New England States, except Vermont, will apparently have a larger production of apples this year than last, Vermont being very slightly below.

Forecasts of peaches and grapes were practically the same as a month ago. The peach crop is estimated at 2,250,000 bushels compared with 3,500,000 bushels last year. Prospects for grapes are slightly better than usual, although the crop is beginning to feel the effect of dry weather. In the Chataqua section leaf hoppers are more plentiful than was expected. The August forecast indicates a crop of 71,000 tons of grapes compared with 105,000 tons of grapes last year.

FIRST N. Y. BARTLETTS ARRIVE

The first New York State Bartlett pears arrived in New York market last week from Hudson Valley. They brought \$2.50 @ 3.25 per bu. basket. Clapp's Favorites, both barrels and baskets, were more plentiful, selling August 17 at \$2 to 3 per bu., principally \$2.50 @ 2.75; barrels, \$6.50 @ 8.50, principally \$7.50 @ 8.

There were a few Seckels, mostly from Oswego County, N. Y., with some from New Jersey. Demand is good for the right quality at \$2.50 to 3.50 bu.

No New York Kieifers are in yet, but some Sand pears, which are practically the same as Kieifers, from Alabama sold in bushel baskets at \$1 to 1.75.

SUMMER APPLES IRREGULAR

Although fancy large apples of either red or green varieties found a firm market last week, the bulk of receipts were of ordinary quality and sold at irregular prices. Following quotations represent wholesale sales of August 16: Per bushel hamper, DUCHESS, best, \$1.25 @ 1.50; fancy, large, \$1.75 @ 2; poor to ordinary, 75c @ \$1; WEALTHY, \$1 @ 1.50; WILLIAMS, red, \$1.25 @ 2; fancy, \$2.50 @ 3; GRAVENSTEIN, \$1.25 @ 1.75; fancy, \$2 @ 2.25.

POTATO MARKET FIRM

Long Island potato growers last week found a pretty good demand for their stocks at an advance of 20c a bushel. The shippers with orders coming in freely had to raise their price, in order to get the cars booked out on time.

The general quotations on 150-lb. sacks f. o. b Long Island loading points ranged from \$4 early in the week to \$4.50 Friday.

The demand for Jersey potatoes increased and Freehold quoted Cobblers in 150-lb. sacks from \$4 @ 4.25 f.o.b.; Salem, \$4.25 @ 4.50 f.o.b.; Robbinsville, \$4 @ 4.25 f.o.b.

The New York City market did not keep up to the rising prices in the

country and the demand at the advanced prices was slow.

DECREASE IN POTATO ACREAGE

The United States Department of Agriculture crop estimate report for August 1, indicates a big decrease in acreage in practically all important States and production far below last year. Maine is the only important northern state that expects a larger crop. The following is a comparison of estimates of 1923 and 1922:

	1923	1922
United States....	379,558,000	451,185,000
New York.....	30,365,000	37,400,000
Maine.....	26,045,000	21,600,000
Michigan.....	29,297,000	37,842,000
Wisconsin.....	27,211,000	40,672,000
Minnesota.....	37,510,000	43,740,000

NEARBY EGG MARKET STRONG

Decreased supplies of nearby white eggs and relative scarcity of high-grade eggs in general western receipts, caused a strong market last week and advancing prices. New Jersey hennerly whites, closely selected extras, were

All the large distributing markets were active and strong last week, but at New York there was a more conservative tendency on the part of buyers toward the end of the week. Prices advanced on lower grades of creamery due to demand from outside sections near New York. Creamery extras, 92 score, advanced to 44c per lb. The average quality is generally improving.

CHEESE MARKET FIRM

The cheese market showed continued firmness last week. On August 16, New York State whole milk flats, fresh, average run sold at 24 3/4 to 25c lb. State flats of fancy quality sold chiefly at 25 1/2 to 26c. Up-State dealers asked relatively high prices compared with New York market. Western prices advanced also with a firm market.

BROILERS DECLINE

Increased supply and less demand caused the market for express broilers to fall off last week. Leghorn broilers

The quality of hay harvested up to August 1 was high. On the other hand, the shortage of labor delayed the cutting of the crop in some sections, and there is some hay still standing which will probably be left unharvested.

New York market for hay was strong last week. Receipts were light and a large proportion of the hay arriving was not of best quality. Buyers were willing to pay higher prices in order to get good hay. Owing to light receipts in Brooklyn, the market there is about \$1 above the 33rd Street market.

BUCKWHEAT HONEY STRONGER

Extracted buckwheat honey was quoted wholesale at New York last week at 10 to 11c per pound. One trade publication had a top quotation of 14c, but this is not considered to represent the market. Large dealers are offering 9c pound in carload lots f. o. b. shipping point and some offers of 10c per pound in the country are reported. There seems a fair prospect for better prices for any buckwheat which can be shipped by September 1. There is little demand at New York now for clover honey, although some buyers are going to production points with the object of contracting for later supply. New York quotations are \$3.50 @ 4 on comb, and 9 @ 11c on extracted.

BEAN CROP LARGER

The bean crop in the United States was estimated August 1 at 1/4 to 1/3 larger than last year and 2-3 larger than in either 1920 or 1921. New York State forecast is 1,479,000 bushels, compared with 1,302,000 last year; Michigan 6,825,000 bushels, compared with 4,809,000; total United States 15,270,000 compared with 11,893,000 last.

Following are New York market quotations on dry beans August 17: Domestic, 100 pounds pea \$6.25 @ 6.50, medium \$7.50; red kidney choice \$7 @ 7.25; white kidney, fair \$8.25 @ 8.50; yellow eye \$7 @ 7.75; pink \$5.75. Pea beans selling slowly. Red Kidneys market weak. White kidneys were held in some instances for \$9, though \$8.75 was the general market.

"I cannot get along without the American Agriculturist. When it is a few days late I have a fear that some one else has got it and fail to return it to the post office. We take a number of papers but none can take the place of our American Agriculturist for clean reading. Wishing you a bigger success for the coming year."—Mrs. Nellie M. Clark, R. D. No. 2, Millerton, Pa.

If it is farm news, you will see it in the American Agriculturist.

Quotations From Eastern Markets

The following are the prices at which farm products of special interest to eastern farmers sold on August 17:

Eggs, Nearbys (cents per dozen)

	New York	Buffalo	Phila.
New Jersey hennerly whites uncandled, extras...	53 @ 55
Other hennerly whites, extras.....	51 @ 53
Extra firsts.....	45 @ 47	37 @ 39	33
Firsts.....	10 @ 41	29 1/2
Gathered, whites, first to extra firsts.....	10 @ 46
Lower grades.....	36 @ 39
Hennerly browns, extras.....	38 @ 45
Gathered browns and mixed colors, extras.....	35 @ 37	34 @ 35
Pullets No. 1.....	34 @ 37

Butter (cents per pound)

	New York	Buffalo	Phila.
Creamery (salted) high score.....	44 1/2 @ 45	47 @ 48
Extra (92 score).....	44	45 @ 46	45
State dairy (salted), finest.....	43 @ 43 1/2	43 @ 44
Good to prime.....	40 1/2 @ 42 1/2	35 @ 42

Hay and Straw, Large Bales (per ton)

	U. S. Grades	Old Grade	Standards
Timothy No. 2.....	\$27 @ 29	\$17 @ 18	\$26 @ 27
Timothy No. 3.....	24 @ 26	22 @ 23
Timothy Sample.....	15 @ 20
Fancy light clover mixed.....	29 @ 30	26 @ 27
Alfalfa, second cutting.....	30
Oat straw No. 1.....	14 @ 15

Live Poultry, Express Lots (cents per lb.)

	New York	Buffalo	Phila.
Fowls, colored fancy, heavy.....	24 @ 28	25 @ 26	25 @ 27

Bulls, common to good.....	4 @ 4 1/4
Lambs, common to good.....	9 1/2 @ 14
Sheep, common to good ewes.....	3 @ 5
Hogs, Yorkers.....	9 @ 9 1/2

quoted at 53 @ 55c per doz. on August 16. Some Vineland, N. J. shippers are getting top quotation on New Jersey hennerly whites f.o.b. Vineland, and some of the very fanciest Vineland eggs bring premiums of 1 or 2c above top quotations. New York State and other nearby hennerly white extras closely selected brought 51 @ 53c; average nearby extras, 48 @ 50c. These prices represent sales of only the very best quality of large, chalk-white, light yolk, full-bodied, carefully sorted eggs, however. The bulk of nearby receipts probably sold at between 40 and 45c. Extra firsts advanced during the week from a range of 42 @ 44c to 45 @ 47c, and firsts from 38 @ 41c up to 40 @ 44c. The feeling at the end of the week was somewhat easier, however. No. 1 pullet eggs sold at 35 @ 38c per doz. Undergrades of pullets, including smalls, around 30c.

At this time last year average extras, nearby hennerly whites, sold at 45 @ 47c, about 3c below the quotation on the same date this year. In the last week of August, 1922, nearby white eggs advanced 4c. They then dropped back a little the first few days in September and after that advanced steadily up to the peak of 94c, in November.

BUTTER MARKET STRONG

It looks now as though the shortage of storage stocks of butter in the country would be greater by September 1 than it was on August 1. Reports from producing sections indicate further shrinkage in production of 5 to 10 per cent, or more, compared with a year ago. Large consumption of ice cream and use of milk for other purposes has reduced the supply for butter.

sold slowly unless of large size. Some small Leghorns sold as low as 25c lb. Following were wholesale prices on express: broilers, August 16: colored 29 @ 30c; Leghorn, large 29c, average 27 @ 28c.

Receipts of fowls by express were light and they sold well at higher prices. Colored fowls sold August 16, 24 @ 28c and Leghorn and poor mixed 23 @ 25c. Long Island ducks, live, spring, sold at 27c per pound and old ducks at 22c, ducks from other nearby sections 21 @ 23c.

Attention is called to the Jewish New Year holiday, September 11-12, for which the best market days are September 6, 7, and 8. Heavy fowls, turkeys and ducks are most in demand at that time. On September 17 and 18 light, white chickens and roosters will be especially in demand for the Jewish Day of Atonement which comes on September 20. These are used ceremonially. From September 21 to 24 heavy fowls, ducks, and geese will be wanted for the Feast of Tabernacles which occurs September 25 and 26.

HAY CROP UNCERTAIN

The crop report issued by the State Department of Farms and Markets last week says that quite conflicting reports were received relative to production of hay in New York State. Prospects differ sharply according to the distribution of the summer showers. The crop is particularly poor in Chautauqua and Schuyler and around the Catskills. For the State as a whole about the usual yield is expected, probably a little over fourteen tons per acre. There is a larger percentage of clover and a smaller percentage of weeds than usual.

Culling Cuts Costs

Get Rid of the Hen That Eats But Doesn't Lay

CULLING may be considered the quickest and easiest way to cut costs in the poultry business. A low producing hen is an expensive member of the flock and the sooner these boarders are eliminated, just so much sooner does the flock show its efficiency.

In many of the big commercial poultry plants, culling is almost an all-year-round proposition. But for the average farmer, who has nothing more than an average flock, this is not the rule. If the flock can be gone over only once in a season, the first of September is considered the best time.

There are a number of differences, both in physical appearance and in action, between the producing hen and the non-producer. Obviously, conditions must be such that those factors that determine the difference between producers and non-producers must be right. For instance, the birds must have plenty of mash and green food. They must be free from mites. Otherwise good layers may show many characteristics common to non-layers. Furthermore, changes of feed and care as well as weather conditions may bring about appearance in layers that will be more or less confusing.

Layers are Vigorous Workers

One of the first indications of the bird that has laid long and heavily is that she is a vigorous worker, a good feeder, has a keen eye, has a bright, intelligent appearance about her, and is a good ranger. Furthermore, she is late to bed and early to rise. In other words, she is all business. There is something about her action that shows that she is always at work looking for food and making every minute count. She is not erratic and flighty.

The low producer, on the other hand, does not show much activity, is indolent and an indifferent eater. There is something about her very appearance that suggests utter indifference to things around her. There is not the bright, aggressive, businesslike air in her carriage. Furthermore, she is very flighty and when caught invariably will make a tremendous racket, squawking and screeching to get away. This is quite different from the contented producer.

Color serves as an excellent guide in determining which hens in a flock are working and which are boarding. There is the color of the flesh, of the shank, of the beak, ear lobe, the eye ring and the vent. In the yellow-skinned breeds, such as the Leghorns, the Rocks, Reds and Wyandottes, the heavy layer will show a white skin. The beak will appear pale; the legs will appear bleached, almost white; the vent will be full and moist; the ear lobe will be white, as will the eye ring. In the case of the non-layer, all these physical points will show yellow. The vent will be tight and dry; the ear lobe will have a fat, yellow appearance.

Color Changes an Indication

In the case of the white skin breeds, the color changes are not so pronounced, and in this case it is more difficult to identify the layers by their color appearance. Therefore, in the white skin breeds, such changes as form and action must be taken into consideration.

A laying hen has a decidedly different form compared to a low producer. The laying hen has a large abdomen and the rear end of the keel is much deeper than the front. Furthermore, her pelvic bones are well spread, her vent is moist and full, her skin is soft, and her back is broad and flat. The non-layer, on the other hand, is small in abdomen, has a dry and puckered vent, thick dry skin, and a short back which is narrow and arched.

The head is an interesting part to use in judging producers. Many poultry men take the eyeball as an indication of producing power. The eyeball of the laying hen can be easily seen when viewed from the rear. Non-layers have a dull eye that is slightly imbedded. Cattle breeders prefer to use a bull that has a prominent bright eye in preference to one that has a dull, sunken, and listless eye.

Other characteristics of the head are the difference of the comb and the beak. The comb of the layer is full, bright red, has a waxy feeling, and is warm. The comb of the non-layer is hard, leather-like and shriveled. Its color is a dull, faded red. The beak of the layer is short and curved and is set in a full, vigorous face of fine texture. The non-layers have long, straight beaks and invariably a fat face.

Molting an Indication

A molting hen usually stops laying. This is not true, however, in the heavier breeds for egg production will continue with a slight molt. Leghorns invariably stop laying when they begin to molt. This is a splendid way to distinguish a non-laying Leghorn from the producer. A good layer, well managed, will not begin to molt until late September or October. Hens that have been well cared for and show up a full molt by the middle of July are not worthy of their keep. It is a whole lot cheaper to take these non-producers, put them in confinement to build them up a bit and then turn them over to the butcher.

HAY GROWERS SHOULD HAVE BULLETIN ON "GRADES"

Every hay producer should secure a copy of the Federal hay grades by applying to the United States Department of Agriculture at Washington. These grades are now in force in the New York and other large markets and are the basis of trading and quotations. Without being familiar with these grade standards, one cannot judge the market value of ones own hay or get any benefit from following market quotations.

The Brown Mouse

(Continued from page 131)

Old Man Simms slunk away down in his seat to escape observation. Then the chairman said that if there was no objection they would hear from their well-known citizen, whose growing fame was more remarkable for the fact that it had been gained as a country schoolmaster—he need not add that he referred to Mr. James E. Irwin. More and louder applause.

"Friends and neighbors," said Jim, "you ask me to say to you what I want you to do. I want you to do what you want to do—nothing more nor less. Last year I was glad to be tolerated here; and the only change in the situation lies in the fact that I have another place offered me—unless there has been a change in your feelings toward me and my work. I hope there has been; for I know my work is good now, whereas I only believed it then."

"Sure it is!" shouted Con Bonner from a front seat, thus signaling that astute wirepuller's definite choice of a place in the bandwagon. "Tell us what you want, Jim!"

"What do I want?" asked Jim. "More than anything else, I want such meetings as this—often—and a place to hold them. If I stay in the Woodruff District, I want this meeting to effect a permanent organization to work with me. All any teacher can do is to direct people's activities in teaching themselves. If I'm to be your hired man, I want a boss in the shape of a civic organization which will take in every man and woman in the district. Here's the place and now's the time to make that organization."

Weight

Every dairyman knows that, in addition to producing ability, weight is a desirable factor in dairy cattle.

Weight in Holsteins Means:

Greater reserve power -- Greater value from calves sold for veal -- More meat value from cows whose milking days are over.

Holsteins are the largest and heaviest of the dairy breeds.

My Engine Does the Work of 6

"I set out to build a farm engine that would have every feature the farmer wanted and none he didn't want. It has now been on the market six years. Thousands of satisfied users tell me I've succeeded. I'm proud to have this engine bear my name."

—A. Y. Edwards

Read the Amazing Facts About This Wonderful Farm Engine

The regular power jobs on your farm probably vary from about 1½ to 6 H. P. Yet there's no need to have two or more engines for these jobs. Today you can get six engines in one. You can get an engine that will deliver 1½ H. P. for the little job, 6 H. P. for the heavy work, or any desired power in between. You can change power as you change jobs—change power instantly. And you will get high efficiency and low cost at all powers.

No Other Engine Like It

There is no other farm engine like the Edwards. It pumps, washes, churns, separates, milks, runs an 8-inch grinder, 30-inch wood-

saw sheller, small silo filler, concrete mixer, spray rig, etc., and does every job easily and cheaply. No other engine can do this. It is easy to move and can be set anywhere and put to work without fastening down. Burns kerosene or gasoline. Smooth running. No vibration. Safe—no cranking. Safety fly-wheel and all moving parts enclosed. Anyone can operate it.

What Users Say

Fred Dunder, Strathcona, Minn., says: "I certainly like my Edwards Engine. Runs an 8-inch burr mill full capacity. Has plenty of power and then some. It certainly works fine. I like its varying speed and power and its light weight, it is so easy to move from job to job. Best and handiest engine I have ever seen or used and wouldn't part with mine at any price if I couldn't get another one and I wouldn't go back to the old-fashioned heavy type engine to use as a gift. The Edwards does all the company claims for it."

"One of my neighbors was looking over my Ed-

wards and I ran it for him and changed it all the way from 1 to 6 H. P. He will buy one right away. He is using a 4 H. P. at present but at times needs 6 H. P. so this would be the very engine he wants."

A. C. Lukehart, Dayton, Pa., says: "Well pleased with my Edwards and would not trade it for any other kind of engine that I know of as it is so handy to move from one job to another and the company has been fair and square to deal with."

Free Trial Offer

Now—I know I am making some extraordinary claims for my engine. I want to prove them to your satisfaction. I want you to try the Edwards Engine absolutely free. Don't send me a penny. Don't send me an order. Just write your name and address on the coupon below and I'll send you complete information about the Edwards, together with my straightforward, unconditional free trial offer. You will not be obligated in any way.

—A. Y. Edwards

Post Toasties with luscious, ripe Peaches—

EVERYBODY knows the delicious goodness of Post Toasties, those crisp, golden-brown flakes of toasted corn. When sliced fresh peaches are added, and then the cream is poured on—that's double delight—a real treat for the appetite.

And a substantial source of energy, too.

Post Toasties are as near as the nearest grocery store; served as easily and as quickly as you can pour a helping from the package—ready the moment anybody's hungry.

No cooking, no waiting, no bother to prepare a Post Toasties breakfast, lunch or supper—delightfully good to the last flake in the package.

And—here's the wonderful part—a serving usually costs less than a cent.

The name guarantees the Post Toasties quality. Tell the grocer it's Post Toasties you want, and be sure to get the yellow and red wax-wrapped package.

Post Toasties improved CORN FLAKES

Made by Postum Cereal Co., Inc., Battle Creek, Mich.

Look at the Expiration Date on Your Address Label

If your subscription has expired, you can show your appreciation of our courtesy in continuing to send you the American Agriculturist, by favoring us with your renewal at once.

There is no question as to your needing every coming issue of American Agriculturist, because some of the future numbers will contain facts that you would not willingly miss for any amount. The worst kind of economy in the world is to save \$1 by not subscribing for American Agriculturist and thereby losing \$10 or \$100 or even \$1,000 by not having the information that will be given in the next 52 issues of American Agriculturist.

If you were a doctor, you would find the best medical journal indispensable. If you are a real farmer who is out for 100% success and not merely a bare living, you owe it to yourself and family to read every coming issue of the American Agriculturist so that you can keep abreast of the times.

SPECIAL BARGAINS!

Fifty-two issues of American Agriculturist for only \$1 is a bargain, but we offer you even still greater value for your money if you accept one of the following special long-term bargains—

2 YEARS FOR ONLY \$1.50
3 YEARS FOR ONLY 2.00
5 YEARS FOR ONLY 3.00

AMERICAN AGRICULTURIST

It has probably been merely an oversight if you are in arrears in your subscription. Before you forget it, mail your renewal for one of the above bargains and show your heart is still with us in our fight for your success and happiness.

Ducks By the Acre—By R. R. Slocum

Where the Dairy Cow Will Hold Forth

A. A. Radio Talk Broadcast From WEAJ on August 29 at 6.50 Standard Time

By W. E. SKINNER

General Manager of the National Dairy Show

AN Exposition of two-fold value to the people of America—the National Dairy Exposition—is to be held on the New York State Fair Grounds at Syracuse, October 5 to 13 next. This Exposition has to do with the progress of America's agriculture, and the health and welfare of the people, combining as it does a nine days' practical course in agricultural improvement, relating farm operations into terms of business through the medium of the dairy cow, and presenting the use of her products in their relation to child life and the building of a strong vigorous people through proper diet.

The Exposition visualizes America's dairy industry in an intensely interesting form. The vast buildings on the State Fair Grounds will all be filled with exhibits of all that goes to make up this leading agricultural production, so classified and arranged as to convey every detail of information upon what happens to milk from cow to ultimate consumer. Whether in the form of liquid, condensed or powdered milk, butter, cheese, or ice cream, or made into buttons, billiard balls or cloth filler, every detail of manufacture, marketing and distribution will be shown.

The first two days of the show, will be given over to Calf Club work. Boys and girls from 20 States will show their cattle. It will be an exhibit of years of work to get the children of the farm interested in the development of better livestock.

This department of the Exposition will be more elaborate than anything ever before undertaken, and covers an expenditure of about \$6,000 for expenses and prize money. There are already fifteen States that have entered their teams, and thirty or more teams will participate. Also, on these two days the students from twenty or more agricultural colleges will have their judging contests, and, all together, these will be two of the most interesting days for the coming generations that it will be possible to provide.

The profitable and unprofitable cow, feeding rations for best results, the research and investigational work that the United States Government experts have been conducting for years on the health and feeding of dairy cattle, and the sanitary care and treatment of the product and the marketing of it will be graphically pictured. Fifteen hundred head of the best pure-bred dairy cattle in the world, and grade cattle demonstrating the value of cow testing to determine profit or loss in production, will be on display. The five leading breeds of dairy cattle, consisting of the Holstein, Jersey, Guernsey, Ayrshire and Brown Swiss, will be represented by the world's best productions of these breeds, and the Cow Test Associations of America will send their highest producing grade cattle to the show in competition. With these grade cattle, comes the history of their breeding, showing the possibilities of the average farmer obtaining profitable producing animals regardless of how modest his pocketbook may be.

There will be cattle from Canada, and there will be an exhibit of cattle brought

from each quarter of the United States for the purpose of demonstrating effect of climatic conditions on the growth of cattle and their general health, and to results from different kinds of feed produced in each section. This is a feature of the show that no dairyman can afford to miss. The different cattle associations will carry in exhibit form, herds of their cattle, showing the improvement in each generation in conformation and production, and will present the case of the dairy cow in her relation to the agricultural progress of America.

The cattle judging rings of the National Dairy Show attract the world's attention for

the Government has developed of value to the dairy industry, and to the progress of America's agriculture. The machinery display embraces every device that man has perfected to take care of the increasing production from 25,000,000 cows to provide for the increasing consumption of 110,000,000 human souls in our country who have to be fed intelligently. The tremendous growth of the population in our cities with the consequent increase of disease possibilities from city gases and dirt, has necessitated the exercise of the greatest inventive genius of man to protect the vital food supplied by the cow so that it be delivered in clean, wholesome, sanitary manner to the consumer, and that the products of milk be manufactured on a scale to keep up with the enormous demand of the people. All

of this machinery will be shown in operation and all of the methods employed in connection with milk and its products will be shown, explained and exemplified.

The leading men and women who have devoted their lives to the scientific study of human nutrition will present in exhibit all that has so far been developed by science and discovery of proper foods for the building of children through diet into healthy men and women. The last decade has more largely brought science to the service of the child and the mother than any other period in history.

The knowledge obtained of certain necessary properties in foods for the proper development and maintenance of human life under present day environment have been startling and tremendously important.

This branch of this great Exposition will be in charge of a committee of women who are leaders in national nutrition, health and welfare work, and identified with all that is being done for child life.

The National Dairy Council will make a very comprehensive display of all that the dairy industry is doing for the growing child through its guidance, and will also visualize the workings of a city campaign with the schools and public and private agencies covering human welfare through diet.

This Exposition will bring to New York State the world's scientific leaders in health and nutrition, who will be among the delegates sent here officially by the governments of thirty-six foreign countries. The national and international character of the Exposition puts it in the class of the world's greatest expositions that have been assembled in this and foreign countries for purposes of comparison, and to measure progress in human affairs. The holding of the World's Dairy Congress in conjunction with the Exposition provides an unusual opportunity for the leaders of dairying of the world to present to the lay visitors all that man and science have so far developed for betterment of the industry from breeding and feeding of the cattle to the final disposition of their products as human food, or for use in the arts and sciences. So this Exposition is equally as instructive and interesting to the man or woman of the city who is interested in human progress, as it is to the men and woman of the industry.

This is how the Coliseum on the New York State Fair grounds looks at present. Construction work is being rushed in order that it will be ready for the National Dairy Show. This building will be the central point of the great Exposition. In it will be judged the world's finest cattle

the reason that a ribbon won at the World's Dairy Exposition means that the winning cattle are the best that have been presented for competitive showyard honors of the year and that the owner of the animal had the courage to present his cattle for judgment of other men, and his winnings add an extensive appreciation to the value of his cattle.

The exhibit of machinery utilized in the dairy factories is one of the most magnificent industrial exhibits of any show given in the world. The average man in the dairy industry does not know just what an amount of machinery is required to operate the average factory, milk plant or creamery, or condensed milk plant, or ice cream factory, and this show carries the last word in machinery with the idea of presenting each year what the genius of man has perfected for the reduction of labor and increasing output of products in a safe and sanitary manner.

The States that are recognized dairy States in America and the Province of Canada, and this year some of the foreign countries across the sea will not only have some of their machines used in their dairy industry, but their products on exhibition in open competition with ours. This will be one of the most intensely interesting departments of exhibits in the show for the average dairyman.

The Congress of the United States appropriated \$25,000 for the purpose of enabling the United States Department of Agriculture to show in this Exposition all that

Ducks By the Acre

"Here a Quack, There a Quack; Everywhere a Quack, Quack"

By R. R. SLOCUM

IF you want to see commercial duck farming of the most successful type and on the highest scale production, take a motor trip from New York City along the south shore of Long Island. Here and there on the banks of the small streams you catch glimpses of such farms. If you want to get a close-up view of one of them, you must turn off into some side road which leads along a stream not entirely given over to summer residences, where you are almost sure to find a full-fledged plant. You will be greeted on all sides with a hoarse chorus of alarm. The brooder houses are crowded with soft downy ducklings just out of the shell and with ungainly growing ducklings in various stages of development. The yards are white with those waddling about and quacking at one another. Even the water is plentifully sprinkled with web-footed acrobats alternately swimming or standing on their heads searching the bottom for special tid-bits. Hundreds of ducks! Thousands of ducks! Ducks by the acre!

These farms are comparatively small in area, many of them not more than ten acres, but their output is large. An annual crop ranging from twenty to thirty thousand ducklings is common, while some of the largest farms market 100,000 or more. This means, of course, that the land is heavily stocked and the methods used decidedly intensive. It is partly on this account that the farms are located on Long Island for the sandy soil there is well suited to such intensive stocking. Easy access to the New York City market where fat young ducklings are in great demand and bring a good price, is another reason for the development of duck farming in this section.

The men who operate these farms are specialists. Their only crop is ducks and every effort is bent toward producing ducklings in as large numbers as possible and in growing them to market size and standard in the quickest possible time. On their success in these particulars depends the profit which they make.

Long Island ducklings are a well-known product. From the time the baby duck breaks its way out of the shell it displays an astonishing appetite. Handled and fed properly the growth which these web-footed little gourmands make is in proportion to their appetites. At ten to twelve weeks old they weigh from five to six pounds each and are ready for market. Rapidly grown and well fattened, they possess a tenderness of flesh

and a richness of flavor which make roast Long Island duckling a dish never to be forgotten once it has been tasted.

The Pekin is the only breed kept on commercial duck farms. It is a large white duck which by long use has proven its unquestioned superiority for the purpose. The qualities which give it this superiority are large size, good egg production, rapidity of growth, ease of fattening and attractive ap-

Along the streams on the southside of eastern Long Island, where the famous "Long Island Duckling" that appears on the menus of high-class restaurants comes from

pearance when dressed. I visited the duck farm of Robert A. Tuttle at Center Moriches which, among others, proved to be a good typical plant. Many of the methods in use there are described in this article. It is not the largest duck farm on the island, consisting of ten acres and having an output of about 30,000 ducklings, nor is it the most elaborate, but it is extremely practical and successful. Its arrangement is carefully planned and its buildings and equipment, while substantial and very suitable for the purpose, are designed to give the results required of them at the lowest possible cost.

The proprietor is a practical duck raiser of many years experience and very accomodating about giving information. He is a native of Eastport, L. I., and spent many seasons working on duck farms in that vicinity. At Eastport there is a country club which Governor Flower of New York used to visit each season for the fishing. During his stays there the Governor was introduced to roast Long Island duckling at its best and became so fond of them that he decided to have a duck farm of his own near his home in Watertown, N. Y. He cast about for some one well qualified to build and operate this farm for him and eventually selected Tuttle for the job.

"How much capital is required to establish a successful duck farm?" I asked Mr. Tuttle.

"That's hard to say with any degree of exactness," he replied. "Estimating roughly, I should say that for a good practical plant without frills, an investment of about \$1,000 for every 1,000 ducklings marketed would be sufficient. In addition to this some working capital, probably six or seven thousand dollars, would be required to buy feed, pay for labor and meet the other running expenses until the returns from the sale of ducklings began to come in in sufficient amount to take care of these items."

At the Tuttle plant the breeding ducks, about 800 in number, are run in flocks of 200 each with one drake for every seven or eight ducks. These breeders are secured each year by selecting out the best of the ducklings ready for market during June and July. The young breeders are placed in yards where they have access to water in which they can swim and are fed largely on whole corn and plenty of green feed until about the middle of November. At this time a laying ration consisting of a mixture of ground grains together with green feed, vegetables, beef scrap and cooked fish is fed to bring the ducks into lay in December.

At first the ducks do not lay heavily, but they gradually increase until by February they are in full lay and this production continues until hot weather comes. From then on the laying drops off until by July first or soon after, not enough eggs are produced to pay to hold the breeders longer and they are shipped to market. Each year all the breeders are marketed and their places taken by young ducks as the latter are better layers.

The breeders must be sheltered in comfortable houses which afford protection from the rain and wind. Good ventilation is necessary and this is provided by windows or by openings in the fronts of the houses, which can be closed with curtains during stormy weather. The houses have dirt floors which are raised above the outside ground level to make them dry. A heavy bedding of straw is used on the floors and fresh straw is added frequently to keep the houses clean and dry. No interior equipment is required, not even nests, as the ducks lay their eggs in the straw on the floor.

Ducks lay early in the morning. If given the chance, they are likely to lay while in the water and this results in the loss of eggs. Consequently, during the laying season the breeding ducks are confined to their houses

National Dairy Show

ON another page we give the address of W. E. Skinner, manager of the National Dairy Show, which he broadcast from WEA F. on Wednesday, August 29, on American Agriculturist farm radio program. The National Dairy Show and the World's Dairy Congress is to meet at Syracuse October 5 to 13. Probably not again in a generation will there be in New York State such a gathering of the dairy interests and the tools of the trade as will be this world's exposition at Syracuse. Representatives from practically every dairy country in the world and from every dairy State in the Union will bring exhibits, showing all the long list of highest quality products which come from the dairy cow.

And Madam Cow herself will be there in state and in large numbers representing every type and every breed.

These are times when farmers must count their pennies, but for the men who are working so hard to make their living from the cow, a trip to the Dairy Show gives every promise of being a good investment from a financial standpoint alone, to say nothing of the holiday and recreation which nearly every farmer needs.

Label the Exhibit Stock

NEARLY all the agricultural fairs spend thousands of dollars for premiums for farm stock. This is the right procedure, for one of the objects of the agricultural show is to give people examples and results of good breeding methods. But unfortunately, the value of these exhibits and of all this premium money is largely lost because of the way in which the exhibits are conducted.

Except for a few professional breeders, a row of cows or horses, or a pen of hogs or sheep means little or nothing to the thousands of farm folks who walk by them in an effort to learn something new in their business. The cattle are often covered with blankets, successfully hiding their characteristics, and in most cases not even the name of the in-

dividual is given, telling who she is, to say nothing of any descriptive matter telling what she has done. The result is that the average observer goes idly by, and no matter how interested, is able to get little or no real or instructive information about the different individuals in the exhibit.

We venture to say that the value of the average stock exhibit could be at least doubled if over each animal there was a placard giving his or her name, a brief summary of her pedigree and the outstanding features of her record.

A Matter of Service

AS a part of our service to our people, American Agriculturist made arrangements some time ago with a reliable insurance company to furnish for fifty cents extra with every one of our three-year subscriptions a thousand dollar travel accident insurance policy.

Although we have been doing this only a comparatively short time our readers have taken over five million dollars insurance on this plan and several of them have already received returns on this policy for accidents that they unfortunately have been in.

We investigated this policy thoroughly and believe it to be so well worth while that it is worthy of special mention.

Another Point for the East

IN commenting upon the tragedy to everyone concerned of wheat selling below a dollar a bushel, the American Farm Bureau Federation recently said that cooperative marketing is the ultimate solution to the national wheat price problem.

With this statement, we do not entirely agree. The right kind of cooperative marketing would help the problem a lot, by putting the wheat on the market gradually instead of dumping nearly all of it at one time. But cooperative marketing, as it is now organized, cannot take care of over-production or lack of demand, for they both amount to practically the same thing—is just what is the matter with the wheat situation of the present day.

The Eastern farmers can certainly congratulate themselves upon their diversified farm practice. The West is up against it, as "Breeder's Gazette" so well puts it: "Less than seven per cent of the value of farm crops and livestock last year was represented by the American wheat crop. That percentage had seldom been higher than seven. The existing furor over the price of wheat, however, has apparently led some uninformed or misinformed business men and others to believe that the financial stability and future of this country are dependent upon the price which farmers obtain for wheat. Undeniably wheat is one of our major crops, but in total value its position in relation to the total value of other farm crops and livestock is low.

"The man who makes wheat his chief, if not his only cash crop, whether in the wheat belt or elsewhere, is a gambler. He is sure to lose much oftener and much more than he wins.

"America can never be made safe for the one-crop farmer. He will always be in hot water—and in politics. His extremity will always be the political demagogue's opportunity to be elected to an office. Fundamentally the woes of the one-crop farmer are the fuel and the flame of the farmer-labor party movement.

"America never has been and never is likely to be unsafe for the farmer who practices diversified farming, the keystone of which is livestock."

All we need to add to the statement of the "Breeder's Gazette" is the thought that East-

ern farming is diversified farming based upon livestock, chiefly dairying. This kind of farming has its troubles and its periods of depression, but seldom, if ever, does it have the stark ruin which now stares the one-crop wheat farmer in the face.

Do Silos Pay?

EVERY time a dairyman fills his silo and has brought home to him the high cost of growing corn and producing ensilage, he wonders if it really pays, or if there is not some other way of getting a succulent feed for dairy cattle at a lower cost. There have always been dairymen who have never built silos and claim that they can produce milk cheaper without ensilage; and there have been many others who came to the same conclusion after using a silo for a time.

Because of this debated question, we have read with a great deal of interest a new bulletin entitled "A Comparison of Roughages for Milk Production," published by the Iowa State College of Agriculture at Ames. After several years' experimental work in the use of corn silage as compared with other roughages, the writer of this bulletin summarizes his conclusions as follows:

1. The use of corn fodder instead of corn silage reduces milk production 6 per cent and fat production 3 per cent.

2. When the value of dry matter in silage was worth 66 cents per 100 pounds, that in corn fodder was worth 32½ cents.

3. With silage valued at \$4.50 per ton, an acre of corn yielding 8 tons of green feed and converted into silage will yield \$36 worth of feed, whereas, if converted into fodder the value of the crop will be reduced to \$16.21 per acre.

4. When timothy hay is used to replace alfalfa hay in a good dairy ration the production of milk and butterfat is reduced 7 per cent.

5. With alfalfa hay at \$15 per ton, timothy hay is worth 86 cents per ton for feeding producing cows.

6. When corn fodder and timothy hay are introduced in a ration in place of corn silage and alfalfa hay, there is a decrease of eighteen per cent in milk and fourteen per cent in fat production.

7. When the two poor roughages, corn fodder and timothy hay, are fed together, this combination gives to them a slightly higher value individually than where one is fed with a good roughage, but good production or economical returns from the feeds cannot be obtained.

8. Corn silage and a legume hay (alfalfa) are the best roughages for dairy cattle, while corn fodder and timothy hay are poor.

9. If the corn crop is all to be fed to the cows it should be put in the silo. On the dairy farm, hays such as timothy should be sold and legume hays purchased in their stead.

American Agriculturist would be very glad to conduct a discussion by our readers from their own experience as to the value of silage and ensilage in the production of milk.

Quotations Worth While

Hold up your head! You were not made for failure, you were made for victory: go forward with a joyful confidence in that result sooner or later, and the sooner or later depends mainly on yourself.—ANNE GILCHRIST.

Credit For Feed—Cash For Automobiles

Two New York Banker-Farmers State How Banks Can Serve the Farmer

ONE of the most instructive charts exhibited by the Department of Agricultural Economics of the New York State College of Agriculture on the occasion of the Banker-Farmer Conference in Ithaca on July 23-24, was the one printed herewith.

A glance at the chart will show that feed dealers receive but 15 per cent in cash for what they sell. These dealers, however, buy on a sight draft with bill of lading attached and cannot get their merchandise until the draft is paid; in other words, they pay out 100 per cent in cash and receive only 15 per cent. A moment's reflection will show that this condition cannot continue indefinitely.

A glance at the chart will indicate where the rest of the milk check has gone; for the survey that furnished these figures was made in a dairy district. Notice the cash share that was received by the automobile industry and yet it contributes nothing to the production of the wealth represented by the milk check unless perhaps more rapid transportation of the product from the farm to the milk station with a resultant economy of time.

Without holding any brief for the feed dealer, it is obvious that if he is carrying the luxury of indulgence in motor transportation, whether such transportation is considered from the point of view of pleasure or profit, he must be adding the expense to the cost of his merchandise; he must be borrowing capital of his banker and his borrowings must be continually increasing. Sooner or later the banker will be compelled to refuse further extension of credit to the dealer and that time is already here.

Even without the information given by the chart, bankers have become more conservative in their business with feed merchants because they have been forced to realize that such merchants were not making progress in the matter of liquidating their obligations and increasing the rapidity of their turn-over.

Milk is now paid for regularly in cash every thirty days and the feed that has contributed to the production of milk should be settled for every thirty days. If the milk check will not pay the feed bill, the producer should discontinue his dairy operation. Too often the milk check is expected to finance the entire farm operation: this expectation is entirely unreasonable, especially as milk is being sold at less than the cost of production due to the fact that the unorganized elements among producers are in sufficient volume to continually depress the price by undermining the market in their individual efforts to dispose of their product.

The purpose of this article is not to criticise any group, either dealer, producer, banker or feed manufacturer, but to bring graphically before each the exact conditions at present existing. If the conditions are recognized, the corrective is simple. Let every producer resolve and keep the resolution, to settle for feed

By HENRY BURDEN
President of the Cazenovia National Bank
purchased during any month with the cash that he receives for milk produced during

force, it would be but a short time before feed prices would respond—feed dealers would be paying off bank loans and bankers would be anxious to put that same money out to farmers who might wish to purchase stocks of feed in excess of what they might need for a current monthly supply.

To put the matter bluntly, perhaps producers should be more scrupulous in their ethics in dealing with purveyors of feed.

Do You Use the Banks?

THE two articles about farmers and the country banks on this page were written by men whose interest and sympathies are wholly with farmers and their problems. Both of them have had long personal experiences with both banking and farming in New York State. Mr. Burden is president of the Dairymen's League Cooperative Association of Madison County and Mr. Mellen is president of the Farm Bureau of Seneca County. Mr. Mellen's farm is the old John Johnson place where the first tile drain were used in America.

Both of these men have said something for every farmer to think about. Obtaining credit from the feed dealer helps to make the farmer's hard times harder. Have you had satisfactory or unsatisfactory experiences with banks? How could country banks be of more service? Do you use the banks? Let us have a short letter from you on the subject giving your experiences. Names will be considered confidential. Address the Editor, American Agriculturist, 461 Fourth Avenue, New York City.

that month. If there is anything left it can go for other things. If this plan were put in

was a good farmer, he was also a good business man, and it was a source of great pleasure to me to see him draw up a check, and hand the long, narrow insignificant looking piece of paper to a man for husking corn, or days labor or perhaps for some sheep or cows. He always was careful to make a plainly written notation on the dated and numbered stub of his check book which showed exactly what the transaction had been between him and the person the check was given to. These stubs are interesting reading to-day, and I shall never forget how the cancelled checks marked "Paid" came back to the old farm desk from the local bank, bearing the endorsement of the hired man.

My father explained to me how simple, and safe, and satisfactory a thing it was to maintain a bank account. My father was careful also to explain how he never overdrew his account by issuing checks for more than he had deposited in the bank, for this made trouble for him as well as the bank. He further showed me how much safer the money was in the bank vault than there on the farm in the old wooden house we lived in.

It was these early lessons from my father that caused me never to be without a bank account. Sometimes a small one, but always a bank account. How I wish that every farmer in this and other States could learn the lesson as I learned it, for if they once saw the simplicity and usefulness and satisfaction of the bank account, they would readily see how they could not afford to do without one.

Another advantage derived from the account with your local bank is the fact that you come in touch with your bank men. You get to knowing them and they to knowing you, and this means that when you really need some financial aid, you are better able to explain to them the exact situation. Don't get the idea, brother farmer, (for though president of a bank now, most of my life has been on a farm), that the bank president is going to treat you as if you were a beggar. Don't think that because he asks you many ques-

PROHIBITION BALLOT

OF THE
AMERICAN AGRICULTURIST

Are You for the Strict Enforcement of the 18th Amendment as It Now Stands? ☐ YES ☐ NO

Are You for a Modification of the 18th Amendment to Permit Light Wines and Beer? ☐ YES ☐ NO

Designate your opinion by placing an X in the square opposite Yes or No on each question. Sign your name and address. Your name will be kept *strictly confidential*.

Name.....

Address.....

Why You Should Vote

Do the American people want prohibition? The Wets emphatically say "No" and the Drys are even more emphatically for it. Both sides claim a majority. Which is right? What do farm people think about it? The opinions of farmers on any problem, if they will express them, go far in determining the outcome of a controversy.

American Agriculturist is taking a vote of farm families on the question of prohibition. It is a vital issue and whether you are for it or against it, be sure to vote in the spaces above. Mail this ballot to the American Agriculturist, 461 Fourth Avenue, New York City.

Get your friends to vote—More ballots furnished on application

Kodak on the Farm

Press the button and the picture is yours; date and title the film and the record is complete. The Autographic Kodak keeps all the story.

Obviously such a record, worthwhile for pictures of the sort shown above, is valuable for practical use as well. Dated negatives of buildings, stock, crops and equipment are the kind you want for reference and year-to-year comparison.

And it's all easy—and fun—with a Kodak.

*Autographic Kodaks \$6.50 up
At your dealer's*

Eastman Kodak Company, Rochester, N. Y.

A JOB THAT WILL PAY YOU WELL

If you want to make a good salary and expenses, tell us what experience you have had in selling to farmers.

We have vacancies for a few more hustling salesmen who like to work for good pay.

Write us for particulars. Mention the counties you prefer in case your own county is already taken.

Don't apply unless you are an enthusiastic believer in the great value of A. A. to every farm family in the east.

When Fertilizer Is Good

Drilling Condition is an Important Factor

WITHIN the past few years consid-

By W. L. GAY

ate much of this difficulty. Of course, it

erable progress has been made by the Experiment Stations and fertilizer selling agencies in the development of the high analysis mixed fertilizer. Through this medium it is possible to effect considerable saving in the fertilizer investment. High analysis makes it possible to obtain a greater amount of plant food at less cost, through savings in the amount of freight paid and the elimination of "artificial filler" which has no plant food value.

One of the most important considerations from the standpoint of the farmer in his purchase and use of fertilizer, is the necessity of proper mechanical (drilling) condition. No matter how high the analysis of his fertilizer may be or from what excellent raw materials it may be prepared, if the mechanical condition is not all that it should be, great loss and annoyance will be experienced.

Mechanical condition means: Drilling quality, handling quality, keeping quality in storage; efficiency of the mix, effect on bag in storage.

Drilling Quality

The drilling quality of a fertilizer is of the greatest importance as in every acre there are 43,560 surface feet. If an application of 200 pounds of fertilizer to the acre is made, each acre gets 3,200 ounces, and every square foot gets less than one-tenth of one ounce. Estimates show that an acre of soil with a plow depth of six inches weighs about two million pounds. Thus, where 200 pounds of fertilizer is used each pound must supply 10,000 pounds of soil with plant food. It is evident from this that equal distribution is not easy, even under the most favorable conditions, and should the goods be in such poor mechanical condition as to make handling and drilling difficult, uniform distribution would be quite out of the question.

Following this a little further, we find that if one out of every ten square feet is deprived of its share of fertilizer, only nine square feet would be fertilized out of the ten put into seed. But, if the fertilizer is in proper mechanical condition so that it will flow through the drill and into the soil evenly, every square inch will receive its share and every plant will have its proper proportion of plant food.

Handling Quality

When the farmer receives fertilizer that is gummy and sticky, or hard as a rock, it is enough to try the patience of a saint, to say nothing of the loss that will be encountered. With sticky goods the drill is continually breaking, distribution is uneven, and much time is lost in planting the crop. When fertilizer sets so that it has to be emptied from the bags, broken up and screened, there is usually loss of several pounds of fertilizer from each bag as well as loss of time and the labor involved in reconditioning the goods. Fertilizer should be and can be so manufactured that it will arrive and remain in a dry, granular condition. Fertilizer manufacturers are spending much money and effort in their endeavor to eliminate all possibilities of chemical reactions which give the unsatisfactory conditions described above.

Keeping Quality in Storage

This is a matter extremely important to Northern farmers who find it desirable to have their fertilizer shipped early in the winter, so that they can take advantage of good sleighing to haul the fertilizer home. In recent years it has also been possible to avoid freight congestions by having the fertilizer shipped in the early months of the season. Many farmers, however, have encountered unsatisfactory experiences by following out this plan, owing to the fact that their fertilizer did not keep well in storage.

Unsatisfactory keeping quality is usually due either to an excess of moisture in the goods when shipped or an excess of free phosphoric acid in the acid phosphate used in the mixture. Proper chemical control on the part of the manufacturer will elimin-

is true that in many cases fertilizer is accused of having poor keeping quality, when in reality the difficulty is due to the manner in which the goods were stored. When fertilizer is to be kept for any length of time before use, it should be stored in the best weather-proof building available with the floor well off the ground, and with the first tier of bags standing on end. It is also desirable to have straw scattered in between the bags. The fertilizer should not be stored in a place where barn doors may be opened and storms allowed to blow in, even for a short space of time. If possible, the fertilizer should not be hauled from the car to the storage building during a time when there is any appreciable amount of moisture in the air.

Efficiency of the Mix

Thorough and complete mixing of the various raw materials going into the make-up of a fertilizer has much to do with the crop-growing efficiency of that fertilizer. If the goods are not thoroughly mixed, each bag will not contain its proper amount of plant food, and consequently the soil will not receive its proper proportion of ammonia, phosphoric acid and potash, and the plant growth will, therefore, be uneven.

Phosphoric acid tends to hasten maturity and an excess of it in one place may hasten the ripening of the plant to such an extent as to make a small and withered grain. On the other hand, nitrogen has a tendency to retard maturity and an excess of it might retard the maturity of the plant to such an extent that immature grain would be harvested or the harvest delayed considerably.

A thorough mix in which every pound of fertilizer in the bag has its proper proportion of each form of plant food, will produce a field of uniform growth and material. An efficient mix gives a balanced ration for the plant.

Effect on Bag in Storage

The farmer who picks up a bag of fertilizer which comes apart in his hands is usually exasperated, and rightfully so. This condition ordinarily results from an excess of free phosphoric acid in the acid phosphate, which upon uniting with muriate of potash in the mixed fertilizer forms hydrochloric acid fumes, which destroy the texture of the burlap and rot the bags.

This condition is particularly apt to occur in very hot, damp weather and can be controlled only by careful attention on the part of the chemical laboratory at the fertilizer plant.

The Advantages of a Check Book

(Continued from page 141)

tions that he is not unreasonable. He is not, for he has a right to know some reasons for your wanting to borrow money, money that is not his, but that belongs to some one else who has trusted it in his hands for safe keeping. Naturally, too, he wants to know how and when you expect to pay it back. Remember, too, the banker is not going to repeat to anyone what you tell him about your affairs. His job is keep it to himself. Get acquainted with your banker, and let him get acquainted with you, and you will find he will meet you more than half way, and unless your explanation is unsatisfactory, will gladly accommodate you.

Farmers, as a rule, are careful to take care of their obligations, and the man that does this, be he farmer or merchant, secures the good-will and confidence with the banker and good bank service.

I sincerely hope better times are not far distant for farmers. The sooner the better. No one deserves to have good returns for his products and labor more than our American farmers, and I have found out that no class of men make good and pay back any better than the farmer when he gets his pay.

When I Buy a Used Car

Problems the Automobile Owner Often Runs Into

IT so happens that in the course of my various business transactions, I often find it necessary to purchase a used car for myself or some of my employees. Such cars if carefully chosen answer my purpose equally well as new ones, and at a substantial saving.

This, however, would *not* be the case if I did not use keen, business shrewdness and judgment in buying, for one can get "stung" very easily in purchasing a machine which may appear all right, and be in a sad state of health under its skin. As a rule, I favor standard makes of known sturdiness and quality. I avoid carefully, orphaned cars or those for which it is difficult to get service or parts. The inconvenience, expense, and tie-up may mean serious loss.

Cars Not Too Old

Second, I favor cars which are not over three years old unless as the case in a few instances, the machine is of some special model of a little earlier type which possessed peculiar excellence and durability. Occasionally such a car will be worth more than a later one which was cheapened in the making. Knowing what to buy in this respect and what to leave alone means a little study in order to keep posted. Insurance rates are often a valuable index, for these rates are usually gauged according to the actual value and power represented. For example, the insurance on a car of a certain make of the year of 1916 is higher than on any similar cars made by the same factory since. There's a reason.

The third point I take into consideration in buying a used car is the history of the car itself. Who owned it in the first place? How long did the original buyer use it? How many hands has it passed through since? What sort of care has it had?

If for example, the machine was first owned by a man who had a couple of boys who literally "drove the daylights out of it"; then the car was purchased by a country doctor for use over all kinds of rough, hilly roads; and lastly was put into service by a bootlegger; and if the car finally figured in one or two smashes—I do not want anything to do with it.

If, however, the car has a clean record of reasonable use and good care, I am ready to be interested.

The "Man" Factor

The fourth point has to do with the reputation of the one of whom I propose to buy. If it is the car owner himself or a used car dealer, I take into consideration *how much* his word of honor is good for—and whether or not his sole object is to unload regardless of whether I am going to be dissatisfied or not, once he has my money. On several occasions I have refused to be interested because I was approached by people whose "word of honor" amounted to little.

Knowing, however, that the owner of a car is likely to be prejudiced in its favor and will naturally want to get all he can out of it, and may not know for a fact how weak it is in some parts, I do not trust to his judgment or mine entirely. I make up my mind as to what I *think* is the true situation. Then I have an expert mechanic whom I can trust, go over it and give me his opinion of the shape it is in. I handle this matter so that the mechanic does not know who owns the car, as a rule, and the one who owns the car has no way of knowing the particular mechanic I will consult. This prevents the possibility of confusion.

The sixth point has to do with the price of the car. I reckon that I must have an attractive price as long as I am buying the vehicle "as is"—without the usual guarantees for new goods.

The seventh and last point I consider is terms of purchase, promise of service, special inducements, and individual guarantees. How much do such guarantees mean? Can the dealer or owner who makes them back them up? Are the terms fair? Are the concessions so liberal as to arouse my suspicions.

These seven points may seem a good deal of a process to go through, but in

reality it is all very simple, takes little time, and is much cheaper than to buy a car which only proves to be a pile of junk.

There are on the market thousands and thousands of excellent and reliable used cars. It is from this class which I propose to buy and not from the puddle-jumpers which are of relatively little value as far as my work is concerned.—L. G. HERBERT, New York.

REPLACING PISTON RINGS

My engine has been running badly the last few weeks, and I believe it is because the piston rings are worn so that I do not get compression. One of the local garage men tells me I should get some of the new forms of piston rings. Can you give me some information on the results you get with them?—N. S., Pennsylvania.

The type of piston ring made by the manufacture of the engine, would probably give you as satisfactory service in replacement as would the more expensive specially designed ones. The main thing in piston rings, is a good fit. I have seen engines in which the most expensive rings, badly fitted, gave very poor results. I do not know how old your engine is, but unless you have been using it very hard, I do not think that there is a necessity for using specially designed rings. In cars and trucks, however, it is a different proposition. Automobile engines are subjected to much harder usage than are other engines ordinarily, and the wear on them is greater. There is also need for tighter compression on an automobile engine, and for this reason the patented piston rings sometimes give better results than plain ones.

CRANK CASE OIL BECOMES DILUTED

My tractor bothers considerable with kerosene working into the crank case, thinning the oil and causing it to work up and foul the spark plugs. Tractor has been run about 200 hours. I can get only twenty hours running out of a filling of two gallons of lubricating oil. Would it be advisable to install an oil-proof ring in the bottom grooves and leak-proof rings in the top?—J. J. B., Pennsylvania.

With the little use that has been given your tractor, you ought not to be experiencing any difficulty with the dilution of the oil in your crank case, unless the pistons and rings were poorly fitted in the first place, or the cylinders have been damaged in some way through insufficient lubrication. It is possible that at some time or other you may have been running for some time with an exceedingly rich mixture, which would have been conducive to the formation of carbon, which in turn may have caused the piston rings to become gummed up so that they will not function properly.

My first suggestion would be that you look into the matter of the type of oil that you are using. I have known of cases where the change of oil has worked wonders, especially is this true in comparing the operations of a tractor in warm and cold weather.

The next thing to do would be to remove the pistons and examine them and the rings as well as the cylinder walls. I suspect that by the time you have gone this far, you will have discovered the trouble, because it would be very unusual to find so new a tractor in shape bad enough to cause the troubles which you have mentioned.

HOW TO TIGHTEN A LOCK NUT

Automotive machinery that is subject to a great deal of vibration and noise has to be held together in many places by a double nut, known as a lock nut. The proper adjustment of this type of nut is simple.

Most lock nuts are simply double ordinary nuts; that is, a second nut is put on the threads over the first one. In tightening them up, the first nut should be drawn up as tightly as possible, then screw the second nut down upon it. With the second nut held firmly in place, unscrew the first nut against the bottom of the second nut. This will lock the two tightly together and effectively prevent them from being loosened by vibration.

TIME TO INCREASE YOUR GRAIN RATION

Pastures are drying up with the waning of summer. Cows are coming back into the barn for the long confinement in stanchions. Silos are filled to the eaves. Higher milk prices are just ahead.

Time to think about your grain ration.

IS YOUR'S GOING TO BE RIGHT THIS FALL?

It will be if its protein basis is a good liberal allowance of DIAMOND CORN GLUTEN MEAL, the concentrate that gives you the most milk-making protein for your money.

You want to be sure of a heavy milk yield when milk prices are high. You can be sure if you feed DIAMOND. Without it in your ration you're risking a loss you can easily prevent.

YOU NEED COLUMBIAS

End all that fussing with faulty ignition by getting a Columbia Hot Shot Battery. Full delivery of power in its water-proof, moisture-proof, super-durable steel case. No mechanical complications to get out of order, or eat up money on repairs. The largest laboratory, devoted to dry cell development, insures a uniformly high quality product for tractor and gas engine ignition.

Columbia Dry Batteries

—they last longer

Columbia Dry Batteries for every kind of service are sold at electrical, hardware, and auto accessory shops, garages, general stores. Insist upon Columbia.

BEFORE YOU BUY A WINDMILL

Carefully consider the following facts: A year's supply of oil is sent with every Aermotor

The Auto-oiled Aermotor is the Genuine Self-oiling Windmill, with every moving part fully and constantly oiled.

The Auto-oiled Aermotor has behind it 8 years of wonderful success. It is not an experiment. The double gears run in oil in a tightly enclosed gear case. They are always flooded with oil and are protected from dust and sleet. Oil an Aermotor once a year and it is always oiled. It never makes a squeak.

You do not have to try an experiment to get a windmill which will run a year with one oiling. The Auto-oiled Aermotor is a tried and perfected machine. Our large factory and our superior equipment enable us to produce economically and accurately. Every purchaser of an Aermotor gets the benefit from quantity production. The Auto-oiled Aermotor is so thoroughly oiled that it runs in the lightest breeze. It gives more service for the money invested than any other piece of machinery on the farm. The Aermotor is made by a responsible company which has been specializing in steel windmills for more than 30 years.

Among the Farmers

The Vegetable Industry—New York County Notes

THE New York Canners' Association realizes that the success of their business is dependent upon the prosperity of the crop growers and upon the quality of the raw products. Through a fund that the association has established, the New York State College of Agriculture is making a thorough survey of the industry, to discover the chief needs and to learn in what ways it can help. On July 18 to 20 a three day tour of the canning counties of western and central New York was staged. About fifteen took part, including canners, and representatives of the different departments at Cornell and Geneva. In this way the attention of the leaders in research was focused upon the canning problems and the way was prepared for a careful consideration of the data gathered in the survey.

Here is a method that might well be commended to the attention of vegetable growers in general. Will it be surprising if the canners succeed in gaining at least a part of the help that they need? The unfortunate feature is that the Canning Crop Growers' Association and the Canners have not been able to work together to an extent that would enable them to make common cause of this movement which is unquestionably in the interest of both.

Cabbage is Dry

Drouth in Central New York is hindering the development of the cabbage crop. Acreage is somewhat reduced as well, and prospects at this early date seem to favor good prices. It is true that good rains after the date of this writing will be in ample time to greatly increase the yield. Insects however are causing serious damage, aphids in particular.

Bad Lettuce Deal

The muckland lettuce deal in New York has been one of the worst in years. At no time since the beginning of the season have prices been satisfactory, although at this writing there is slight improvement. Acres have been plowed under.

The lettuce crop is a gamble at best. The 1923 season will doubtless weed out numbers of marginal growers—the ones who are more interested in something else—the ones who are not willing to find and pay for the best seed, who do not give the crop the best of care and who do not study the markets as thoroughly as is possible. Even the best of the growers are having a hard time. Perhaps out of the trials of '23 will grow up some plan of orderly marketing—a thing that has been utterly lacking in the past and which is more needed in this field even than in most others. Robert Bier of the United States Department of Agriculture and F. O. Underwood of the Department of Vegetable Gardening at Cornell have been in the field sounding out sentiment with regard to establishing United States standards for the crop. Four or five packing house associations in the leading centers with a State-wide commodity organization to handle distribution would seem to be a possibility worthy of careful study on the part of the producers.

New York Challenges Ohio

T. H. Townsend, secretary of the New York State Vegetable Growers' Association, has issued a challenge to the Ohio Vegetable Growers for a deadly combat to be settled in favor of the State bringing the largest delegation to the Buffalo meeting of the Vegetable Growers' Association of America, September 17 to 20. Ohio has been a headliner in attendance at practically all previous meetings, even at Albany. Townsend thinks it is time for a showdown and he is out to rout the crowd from the whole Empire territory. In the interest of a fair show, he has suggested that the Erie County delegation be not counted.

Both the New York State Fair and the Rochester Exposition the former September 10-15, the latter, September 3-8, are planning to house the veg-

By PAUL WORK

etable exhibits in new and enlarged quarters this fall. The interest in these shows as well as in the county fairs has been steadily increasing during the past few years. Growers are beginning to realize that they must have the best of varieties and strains if they are to meet the keen competition of the day, and there is no better place to compare types than on the exhibition bench. The two big shows have already reached a high stage of usefulness in this respect and the others are fast following. At Rochester and Syracuse one can not only see the prize winning samples, but he can compare the different strains of Davis Perfect and Danish Ballhead. There is also usually someone on hand who can tell where to get things and a few hours among the displays at either place—or both—is sure to be profitable.

NEW YORK COUNTY NOTES

Essex Co.—The hay crop on most farms was good and was put in the barn in good shape. Early grains have turned out to be very satisfactory. Corn, late potatoes, gardens and pastures are suffering from the continued drought. Many brooks are dry and wells and cisterns are low. Red squirrels have been a terrible pest all summer. One of our neighbors killed 100 on his place. They have been very destructive in granaries and have caused much damage to pears and apples.—N. E. B.

Rensselaer Co.—Farmers are well along with their harvesting. Oats are under cover awaiting the threshers. The hay crop was quite heavy and was harvested in good condition. Buckwheat looks fine considering the time it was sown. Pastures are greatly in need of rain with the result that cows are shrinking. Farmers are compelled to buy grain to even maintain the flow of milk.—C. H. W.

Broome Co.—Our 53'd annual County Fair was held on August 14-18. One of the features of the Fair was a historical pageant which was held on one of the evenings. Haying is practically all done. Most farmers have their oats cut and under cover. We had an excellent rain that did buckwheat a great deal of good. All other crops look much better of late.—MRS. E. M. C.

In Western New York

Chautauqua Co.—Farmers are through haying. If it were not that the weather had been so favorable, there is a question whether they would have finished in time to get in next year's crop, due to the fact that help was so scarce. Farmers were never so handicapped for help during haying, in this neighborhood at least, as they were this year. The help they usually depend upon was either employed on the State road or in the neighboring cities. As a result, farmers had to get along the best way they knew. Two men that I know of in particular did a great deal of their haying alone, pitching hay both ways. No one can blame some farmers for throwing up the job and looking for an easier one where they can make more money. The drought, which started in May still continues. We have occasional showers but they are not enough to even settle the dust. We have had only one good soaking rain this summer and that was on the 28th of June. Crops show the effects of the dry weather. Buckwheat is almost an entire failure. Corn, oats potatoes and hay made only from 50-75 per cent of a crop. Many farmers have cut their oats for hay. Cows are drying up rapidly with the result that some dairymen are feeding heavily of grain trying to keep up the milk flow. Dairy cattle are generally looking pretty thin for this time of the year.—A. J. N.

Ontario Co.—Harvesting is practically over. Some farmers still have their oats in the field. We have had little or no rain leaving the ground extremely dry for fall plowing. Some farmers have finished their threshing. Grain turned out fairly well. Some early cabbage is being cut.—H. D. S.

Ducks By the Acre

(Continued from page 139)

until an hour or two after daylight, when practically all eggs will have been laid and the ducks can be turned out. "Do the ducks hatch their own eggs?" I asked.

"No. Artificial incubation is used exclusively by duck farmers," I was informed. "The Pekin is not much of a sitter, and besides we want to keep all the ducks on the job laying eggs. We set the eggs at least once a week and usually twice a week during the period of heavy laying, using large, hot water machines with a capacity of several thousand eggs at one time. It takes duck eggs four weeks to hatch, or one week longer than hen eggs."

The average Pekin duck will lay from 80 to 120 eggs in a season. An incubator capacity sufficient to take care of the hatching eggs at the season of flush production requires space in the machines for 25 eggs from each breeding duck. The incubators are operated about the same as when hen eggs are being hatched, except that during the latter part of the hatch moisture is applied more freely.

Factory methods are employed in rearing the ducklings. As soon as the baby ducks are well dried off after hatching they are removed to the primary brooder house. This is a long house heated by hot water and divided into pens, each capable of holding 100 to 125 ducklings. Each pen is provided with a hover or cover over the hot water pipes, which provides a warm place to which the ducklings can always have access. The pens in the first third of the house, where the heater is located, and which is the warmest portion, are used for the youngest ducklings and are five by ten feet in size. The temperature under the hovers of these pens must be maintained at about 90 degrees.

As new ducklings are hatched and brought to the brooder house, those already there are moved down the house to make room for the newcomers. The pens into which they are moved are six feet wide, to provide for the larger size which they have attained. Later they are moved into the final third of the house, where the pens are seven feet wide, and where the temperature under the hovers need not be over 80.

I noticed that the brooder houses were all equipped with electric lights and asked the reason.

"Ducks may not look it, but they are nervous creatures and afraid to go to bed in the dark," I was told. "If anything startles them in the night they are likely to stampede, surging back and forth in the pens and trampling over one another. In this stampede many will be seriously injured. Even with lights, one must be careful in moving about among the ducks at night for rapidly-moving shadows are likely to throw them into a panic."

The baby ducklings are fed and watered for the first time when they are from 24 to 36 hours old. The first feed of the day is given about 6 a. m.; this is followed by a second feed at noon, and the final feed at about 4:30 or 5 o'clock in the afternoon. Some growers feed four or five times a day when the ducklings are young, but perfectly satisfactory results with less labor can be obtained with the smaller number of feedings.

A good ration in use consists of equal parts, by measure, of corn meal, bran and stale bread or shredded wheat waste to which is added one part in ten of beef scrap or cooked fish and one part in six of finely-cut tender green feed. It is important also that sand be added to the ration until the ducklings can get out into the yards, where they can secure this material for themselves. This ration can be continued until the ducklings leave the third brooder house and are put in the fattening lots, when a more fattening ration is used. The feed for both ducklings and breeding ducks is thoroughly mixed in power-dough mixers, using enough hot water to make the mixture stick together.

As soon as the ducklings are ready to leave the third brooder house, they are placed in the fattening yards. As a rule, about 100 ducklings are yarded together. By this time the ducklings are well feathered out and here, for

the first time, they are allowed access to the water yards. The proportion of corn meal in the ration is doubled, but the practice of feeding three times a day is continued. Drinking water no longer need be supplied as the ducklings quench their thirst from the water in which they swim.

It is very important to market the ducklings at the proper time, usually when they are between the ages of ten and twelve weeks. At this age they undergo a partial molt on the neck and breast, giving them a rather rough look. Unless they are killed within a week after this molt starts they will begin to lose flesh and it will take an additional five or six weeks to get them back in market condition again. Buying feed for this extra period is not good business.

When ready for slaughter the ducklings are driven into a small pen, where they can be caught easily. Each duckling is carefully examined as caught to make sure that it is in good market condition. If the breast is smooth and full so that the breast bone cannot be readily felt, the duckling is in prime condition. If it is not in proper condition it is returned to the fattening yards and fed longer.

Killing begins early in the morning and is usually finished for the day by noon or soon after. Eight or ten ducklings are hung up by the legs at a time and bled by cutting the large veins in the throat. After they are thoroughly bled they are taken down and turned over to the pickers. The picker, usually a woman, selects a bird and takes it for scalding to a large kettle of water maintained at a temperature just below the boiling point. Holding the carcass by the head and feet, the picker plunges it into the hot water,

sousing it up and down until the water penetrates the feathers and causes them to come out easily. She then holds the duck on her lap, or on a board, and plucks off the feathers as rapidly as possible, leaving the main wing and tail feathers and those of the neck part way from the head to the body on the carcass. The most troublesome part of the plucking is the removal of the down. Seventy-five ducklings is a good day's work for an experienced picker.

The feathers are an important by-product of duck plants. As they are plucked they are thrown into a large box beside which the pickers sit. At the close of each day's picking, these feathers are taken to a well-ventilated room and spread out on the floor in a layer not over three or four inches deep. After they have dried out fairly well they are scraped up in a pile and again spread out, this operation being repeated until they are thoroughly dry. They are then placed in burlap sacks and are ready for shipping. It is important that the feathers be thoroughly dry so that they will not heat and mould, in which condition their value is greatly lessened. The feathers are sold to manufacturers who use them mainly in making pillows. Each duckling will yield a sufficient amount of feathers to pay for the cost of picking or possibly a little more.

We asked Mr. Tuttle to tell us how the ducks are packed and shipped to market.

"The most important thing about marketing is to be sure that they are cooled until every particle of animal heat is removed from the carcasses," he said. "This is accomplished by throwing the ducks in water and leaving them there for several hours. If cold running spring water is available, it will answer the purpose very nicely. If not, ice must be used in the water."

FARM WAGONS

High or low wheels—steel or wood—wide or narrow tires. Wagon parts of all kinds. Wheels to fit any running gear. Catalog illustrated in colors free.

Electric Wheel Co., 2 Elm St., Quincy, Ill.

A MORE MILK MESSAGE

More milk from your cows—better physical and health condition of the herd are the rewards that come to the dairyman or farmer who feeds Sugared Schumacher Feed.

Sugared Schumacher is essentially a Maintenance ration. It supplies the cow with an abundance of bodily nutrition—nourishment—and thus fits her to produce MORE MILK. It is giving unusual satisfaction to thousands of critical feeders. Feed

SUGARED SCHUMACHER FEED

as the base or maintenance part of your ration along with cottonseed meal, gluten, Big "Q" or other concentrates and you will see a marked improvement in milk yield and general health condition of your herd. Composed of Corn, Oats, Barley, Wheat, finely ground and sweetened with Cane Molasses, Sugared Schumacher is highly nutritious and extremely palatable. It's sweet—cows like it—do better on it. Your dealer can supply you.

Classified Advertising Rates

ADVERTISEMENTS are inserted in this department at the rate of 5 cents a word. The minimum charge per insertion is \$1 per week. Count as one word each initial, abbreviation and whole number, including name and address. Thus: "J. B. Jones, 44 E. Main St., Mount Morris, N. Y." counts as eleven words.

Place your wants by following the style of the advertisements on this page.

Our Advertisements Guaranteed

THE American Agriculturist accepts only advertising which it believes to be thoroughly honest.

We positively guarantee to our readers fair and honest treatment in dealing with our advertisers.

We guarantee to refund the price of goods purchased by our subscribers from any advertiser who fails to make good when the article purchased is found not to be as advertised.

To benefit by this guarantee subscribers must say: "I saw your ad in the American Agriculturist" when ordering from our advertisers.

The More You Tell, The Quicker You Sell

EVERY week the American Agriculturist reaches over 120,000 farmers in New York, New Jersey, Pennsylvania and adjacent States. Advertising orders must reach our office at 461 Fourth Avenue, New York City not later than the second Monday previous to date of issue. Cancellation orders must reach us on the same schedule. Because of the low rate to subscribers and their friends, cash or money order must accompany your order.

**ALL GOOD THINGS COME TO HIM WHO WAITS—BUT
THE CHAP WHO DOESN'T ADVERTISE WAITS LONGEST**

EGGS AND POULTRY

SO MANY ELEMENTS enter into the shipping of day-old chicks and eggs by our advertisers, and the hatching of same by our subscribers that the publishers of this paper cannot guarantee the safe arrival of day-old chicks, or that eggs shipped shall reach the buyer unbroken, nor can they guarantee the hatching of eggs. We shall continue to exercise the greatest care in allowing poultry and egg advertisers to use this paper, but our responsibility must end with that.

CHICKS—S. C. Buff, White and Brown Leghorns, \$8 per 100; Barred Rocks, \$9 per 100; White Rocks, \$12 per 100; Reds, \$10 per 100; Mixed light breeds, \$6.50 per 100; Mixed heavy breeds, \$8 per 100. All Number One chicks. Circular free. JACOB NIEMOND, Box A, McAlisterville, Pa.

PULLETS—Leghorns, Barred Rocks, Orpingtons, three months old. Hand-picked from contest-winning ancestors. FASHION PARK FARM, Danbury, Conn.

PULLETS—8 to 20 weeks; White Leghorns, Anconas, Minorcas, yearling hens. Priced right to sell. FRANK'S POULTRY FARM, Tiffin, Ohio.

REAL ESTATE

FOR SALE—A CHANCE OF A LIFETIME. One of Chenango valley's excellent 165-acre dairy farms in high state of cultivation. 25 acres alfalfa, abundant crops of hay, corn, oats, cabbage, etc. 60 heads of pure-bred TB tested Holstein cattle. Spring water in house and barn. Good buildings with large maple lawn, beautifully located at main road, 80 rods from railroad station, school, store, milk station. Splendid opportunity to make money from start. Will sell with or without stock. Bare farm with crops is easily worth \$15,000. For quick sale will take \$12,000. J. M. OLSEN, Sherburne Four Corners, New York.

FOR SALE—Farm, 90 acres; well watered; best state of cultivation, raising best of corn, clover, alfalfa; good location, two miles to town, milk stations, school and State school; good buildings and cattle; maple grove, fine cherry orchard and other fruit; ice pond on farm; running spring water. Owner has run this farm 25 years. Unable to handle it longer. Would like to hear from responsible German people and others who appreciate square and honest dealing. FRANK SMITH, Hamilton, New York.

FOR SALE—186-acre Central New York valley, hay, grain, vegetable, and poultry farm. Very productive, fine state of cultivation, tractor-worked meadows, 12 excellent buildings, milking machine, electric lights. Sold with tuberculin-tested herd and complete equipment if desired. Keeps 50 head of stock and 400 hens. ELIZA DUROE, South New Berlin, New York.

FARM WANTED—Wanted to hear from owner of improved farm or good land for sale; priced reasonable. L. JONES, Box 646, Olney, Illinois.

The Service Bureau

And Questions and Answers About Investments

THE Standard Food & Fur Association of New York, is one which has for some time kept the Service Bureau busy. This firm sells rabbits for breeding purposes and assures the buyer that it will buy back rabbits which come up to certain specifications.

It seems very difficult, however, to meet these apparently simply requirements. Rabbits which the breeder is sure weighed the proper amount and more when shipped, are reported as underweight by the firm. One guarantee sent out by the company makes no mention of a definite weight, but simply says "in good condition." Yet repeated shipments are refused.

This is a particularly annoying type of sharp practice, because the buyer not only invests his original capital, but his time while caring for the stock, only to be disappointed months later when the firm refuses his shipment. There is money in rabbit-raising, properly conducted, but it does not come from dealing with the Standard Food & Fur Association.

THE MONEY FINALLY GOT THERE

Another case about which so many letters have been written that we have lost count of their number, concerned two checks, one for \$3.73 and the other for \$30.98. A New York commission merchant claimed that the customer had received his money, but Mr. H. G. S., of New York, the subscriber, was certain he had not.

In the end, duplicate checks were sent, the claim was settled and both the subscriber and the firm thanked the American Agriculturist for its services in the matter.

BUTTER AND EGGS PAID FOR

A check for \$17.06 which was to have reached our subscriber, Mr. P. R. S. some time last spring, has recently been received. The case was taken in hand by the Service Bureau, which persuaded the butter and egg company to trace the matter and to issue a duplicate check.

HALF A LOAF

Although by no means satisfied that she had received what was due her, Mrs. W. J. S. of New York was glad to get a \$5 check which the Service Bureau forwarded to her recently.

She had had a claim against a commission house which refused to pay for fowl she shipped them. We succeeded in getting the firm to offer a compromise settlement which Mrs. S. accepted. Another time, we will hope to obtain all she believes is coming to her.

QUESTIONS AND ANSWERS ABOUT INVESTMENTS

Financial Department:—Kindly advise me regarding an altogether safe investment for \$1,000 yielding about 7 per cent. Would you consider Hershey Brothers Chocolate Company of Harrisburg, Pa. a safe investment? The preferred stock sells at 100 and yields 7 per cent. This is not the original Hershey Chocolate Company of Hershey.—A. G., Pennsylvania.

We have been unable to get any information about Hershey Brothers' Chocolate Company preferred stock. The Hershey Chocolate 6 per cent bonds, the original Hershey Company, are, we think, very desirable investments. The yield is about 6.15 per cent. You must understand that 7 per cent is a high return to ask in conservative securities. If you divide your \$1,000 between Mack Trucks first preferred, selling about 96, and General Motors 7 per cent debentures, selling about 102, you will get a return of 7 per cent with reasonable security.

* * *

Financial Department:—Will you advise if the following bonds are safe: Chicago Railway 5s, Middle States Oil Co., (United Tractors Corporation) Frankfort, N. Y.?—C. C. C., New York.

We have no information about the United Tractors Corporation. None of the securities of the Chicago Railways or the Middle States Oil is suitable for conservative investment. Chicago Railways first 5s sell to give a maturity

yield of over 10 per cent, which indicates grave doubts in the minds of investors. As to the Middle States Oil we urge all our readers to avoid securities founded in part or in whole on oil unless it be the preferred stock or the bonds of one of the Standard Oil Companies.

* * *

Financial Department:—Kindly advise me what you know about the North American Mortgage & Building Corporation represented by Maxwell C. Franklin of 31 Union Square? I would like to know whether they are reliable or not?—A. D., New Jersey.

We do not recommend stock in a mortgage company as a suitable investment for one unable to keep in close personal touch with the affairs of the company. This is not to say that the concern may not be perfectly reliable. Its stock, however, represents a business risk not to be undertaken by those unable to lose.

Don't Speculate

Financial Department:—I am interested in the Commonwealth Hotel Construction and have agreed to take one share of stock at \$125 and have paid \$25 last November 25. Could you give me any advice, and shall I pay the balance?—J. B. S., New York.

We hardly know what advice to give you in regard to the Commonwealth Hotel stock. Until this hotel is built and in operation and has demonstrated its earning capacity its stock is entirely speculative. No one can foresee whether or not the speculation will be profitable. Unless you are in a position to speculate, the conservative course would be to charge the \$25 you have already paid to experience.

Strong Corporations

Financial Department:—Do you consider Fleischmann Yeast and National Biscuit Co. desirable for investment?—J. M., New York.

Both Fleischmann Yeast and National Biscuit are strong and prosperous corporations. Their common stock, however, is not a conservative investment. A stockholder gets profits when there are profits, and when there are none he goes without. He must also bear in mind that if he wants to realize on his investment he has to take the market price of the stock at the time he wants to sell, and that may be lower or it may be higher than the price he paid. If you are able to assume this business risk, probably these are good companies, but you are speculating.

Companies Vary in Strength

Financial Department:—Will you kindly advise on the following investments: Standard Tank Car Co. of Sharon, Pa., Shafer Oil and Refining Co., H. A. Stone & Co. of Philadelphia, Eastern Shore Gas & Electric Co., the Square Deal Land and Developing Co. of Belfast, Me.?—J. S. Masten, Harrington, Del.

The companies you list vary greatly in strength. We think the Standard Tank Car to be the best. However, if security is of prime importance, we advise you to buy only seasoned bonds. It is better to take a small return and be safe. Why not buy one or more shares of the preferred stocks of the United States Steel Corporation? It has never failed to pay dividends through good times and bad, and is the strongest corporation in America. It will give you a yield at market prices of almost 6 per cent. You can buy one or more shares at a time and the stock is always instantly salable.

Be Specific

Financial Department:—Will you advise me about the following concerns: Steuben Trust Company of Hornell, N. Y.; and The Empire State Abstract Corporation, Bath, N. Y.; S. W. Straus & Co.; Ice Service Co., Inc., New York City?—W. M. G., New York.

You will have to be a little more specific and let us know just what it is you want to know about each of the corporations you name. S. W. Straus sell mortgage-secured bonds which vary in merit according to the property on which they are a lien. Mostly they are, in our opinion, very good. We do not recommend stock in the Ice Service Corporation for investment. The other two financial institutions you name, as we understand it, issue notes based on first mortgage collateral. The loans are said to be placed all in the City of Binghamton, N. Y. Ordinarily this is good security. It all depends on the management, and as to this we have no specific information.

The Brown Mouse—By Herbert Quick

"DAT sounds good," cried Haakon Peterson. "We'll do dat!"

"Then I want you to work out a building scheme for the school," Jim went on. "We want a place where the girls can learn to cook, keep house, take care of babies, sew and learn to be wives and mothers. We want a place in which Mrs. Hansen can come to show them how to cure meat—she's the best hand at that in the county—where Mrs. Bonner can teach them to make bread and pastry—she ought to be given a doctor's degree for that—where Mrs. Woodruff can teach them the cooking of turkeys, Mrs. Peterson the way to give the family a balanced ration, and Mrs. Simms induct them into the mysteries of weaving rag rugs and, making jellies and preserves—you can all learn these things from her. There's somebody right in this neighborhood able to teach anything the young people want to learn."

"And I want a physician here once in a while to examine the children as to their health, and a dentist to look after their teeth and teach them how to care for them. Also an oculist to examine their eyes. And when Bettina Hansen comes home from the hospital a trained nurse, I want her to have a job as visiting nurse right here in the Woodruff District."

"I want a counting-room for the keeping of the farm accounts and the record of our observation in farming. I want cooperation in letting us have these accounts."

"I want some manual training equipment for wood-working and metal working, and a blacksmith and wagon shop, in which the boys may learn to shoe horses, repair tools, design buildings, and practice the best agricultural engineering. I want some land for actual farming, and I want your cooperation in a poultry plant somewhere in the district. I want a laboratory in which we can work on seeds, pests, soils, feeds and the like."

"I want these things because they are necessary if we are to get the culture out of life we should get—and nobody gets culture out of any sort of school—they get it out of life, or they don't get it at all."

"The school I ask for will make each of you more money than the taxes it will require would make if invested in your farm equipment. If you are not convinced of this, don't bother with me any longer."

"I WANT all these things, and more. But I don't expect them all at once. I know that this district is too small to do all of them, and therefore, I am going to tell you of another want which will tempt you to think that I am crazy. I want a bigger district—one that will give us the financial strength to carry out the program I have sketched. This may be a presumptuous thing for me to propose; but the whole situation here to-night is presumptuous on my part, I fear. If you think so, let me go; but if you don't, please keep this meeting together in a permanent organization of grown-up members of the Woodruff school, and by pulling together, you can do these things—all of them—and many more—and you'll make the Woodruff District a good place to live in and die in—and I shall be proud to live and die in it at your service, as the neighborhood's hired man!"

As Jim sat down there was a hush in the crowded room, as if the people were dazed at his assurance. There was no applause, until Jennie Woodruff, now seen by Jim for the first time over next the blackboard, clapped her gloved hands together and started it; then it swept out through the windows in a storm. The dust rose from stamping feet until the kerosene lamps were dimmed by it. And as the noise subsided, Jim saw standing out in front the stooped form of B. B. Hamm, one of the most prosperous men in the district.

"Mr. Chairman—Ezra Bronson," he roared, "this feller's crazy, an' from the sound of things, you're all as crazy as he is. If this fool scheme of his goes through, my farm's for sale! I'll quit before I'm sold out for taxes!"

"Just a minute, B. B.!" interposed Colonel Woodruff. "This ain't as dangerous as you think. You don't want us to do all this in fifteen minutes, do you, Jim?"

"Oh, as to that," replied Jim, "I just wanted you to have in your minds what I have in my mind—and unless we can agree to work toward these things there's no use in my staying. But time—that's another matter. Believe with me, and I'll work with you."

"Get out of here!" said the colonel to Jim in an undertone, "and leave the rest to your friends."

Jim walked out of the room and took the way toward his home. A horse tied to the hitching-pole had his blanket under foot, and Jim replaced it on his

back, patting him kindly and talking horse language to him. Then he went up and down the line of teams, readjusting blankets, tying loosened knots, and assuring himself that his neighbors' horses were securely tied and comfortable. He knew horses better than he knew people, he thought.

Two figures emerged from the schoolhouse door, and as he turned toward his home after his pastoral calls on the horses, they overtook him. They were the figures of Newton Bronson and the county superintendent of schools.

"We were coming after you," said Jennie.

"Dad wants you back there again," said Newton.

"What for?" inquired Jim.

"You silly boy," said Jennie, "you talked about the good of the schools all of the time, and never said a word about your own salary! What do you want? They want to know?"

"Oh!" exclaimed Jim in the manner of one who suddenly remembers that he has forgotten his umbrella or his pocket-knife. "I haven't thought about that at all, Jennie!"

"Jim," said she, "you need a guardian!"

"I know it, Jennie," said he, "and I know who I want. I want—"

"Please come back," said Jennie, "and tell papa how much you're going to hold the district up for."

"You run back," said Jim to Newton, "and tell your father that whatever is right in the way of salary will be satisfactory to me. I leave that to the people."

Newton darted off, leaving the schoolmaster standing in the road with the county superintendent.

"I can't go back there!" said Jim.

"I'm proud of you, Jim," said Jennie. "This community has found its master. They can't do all you ask now, nor very soon; but finally they'll do just as you want them to do. And, Jim, I want to say that I've been the biggest little fool in the county!"

CHAPTER XXII

AN EMBASSY FROM DIXIE

SUPERINTENDENT JENNIE sat at her desk in no very satisfactory frame of mind. In the first place court was to convene on the following Monday, and both grand jury and petit juries would be in session, so that her one-room office was not to be hers for a few days. Her desk was even now ready to be moved into the hall by the janitor. To Wilbur Smythe, who did her the honor of calling occasionally, she remarked that if they didn't soon build the new court-house so as to give her such accommodations as her office really needed, "they might take their old office—so there!"

"Fair woman," said Wilbur, as he creased his Prince Albert in a parting bow, "should adorn the home!"

"Bosh!" sneered Jennie, rather pleased, all the same, "suppose she isn't fair, and hasn't any home!"

This question of adorning a home was no nearer settlement with Jennie than it had ever been, though increasingly a matter of speculation.

There were two or three men—rather good catches, too—who, if they were encouraged—but what was there to any of them? Take Wilbur Smythe, now; he would by sheer force of persistent assurance and fair abilities eventually get a good practice for a country lawyer—three or four thousand a year—serve in the Legislature or the State Senate, and finally be-

come a bank director with a goodly standing as a safe business man; but what was there to him? This is what Jennie asked her paper-weight as she placed it on a pile of unfinished examination papers. And the paper-weight echoed, "Not a thing out of the ordinary!" And then, said Jennie, "Well, you little simpleton, who and what are you so out of the ordinary that you should sneer at Wilbur Smythe and Beckman Fifield and such men?" And echo answered, "What?"—and then the mail-carrier came in.

Down near the bottom of the pile she found this letter, signed by a southern State superintendent of schools, but dated at Kirksville, Missouri:

"I am a member of a party of southern educators—State superintendents in the main," the letter ran, "*en tour* of the country to see what we can find of an instructive nature in rural school work. I assure you that we are being richly repaid for the time and expense. There are things going on in the schools here in northeastern Missouri, for instance, which merit much study. We have met Professor Withers, of Ames, who suggests that we visit your schools, and especially the rural school taught by a young man named Irwin, and I wonder if you will be free on next Monday morning, if we come to your office, to direct us to the place? If you could accompany us on the trip, and perhaps show us some of your other excellent schools, we should be honored and pleased."

THERE was more of this courteous and deferential letter, all giving Jennie a sense of being saluted by a fine gentleman in satin and ruffles, and with a plume on his hat. And then came the shock—a party of State officials were coming into the county to study Jim Irwin's school! They would never come to study Wilbur Smythe's law practice—or her work as county superintendent—never!—and Jim was getting seventy-five dollars a month, and had a mother to support. Moreover, he was getting more than he had asked when the colonel had told him to "hold the district up!" But there could be no doubt that there was something to Jim—the man was out of the ordinary.

Jennie wired to her southerner for the number of his party, and secured automobiles for the trip. She sent a note to Jim Irwin telling of the prospective visitation.

She was glad of the automobiles the next Monday morning, when at nine-thirty the train discharged upon her a dozen very alert, very up-to-date, very inquisitive southerners, male and female, most of whom seemed to have left their "r's" in the gulf region. It was eleven when the party parked their machines before the schoolhouse door.

"There are visitors here before us," said Jennie.

"Seems rather like an educational shrine," said Doctor Brathwayt, of Mississippi. "How does he accommodate so many visitors in that small edifice?"

Once inside, Jennie felt a queer return of her old aversion to Jim's methods. It was so utterly unlike a school as Jennie understood the word, that she glanced back at the group of educators with a little blush. The school was in a sort of uproar. Not that uproar of boredom and mischief of which most of us have familiar memories, but a sort of eager uproar, in which every child was intensely interested in the same thing; and did little rustling things because of this interest; something like the hum at a football game or a dog-fight.

On one side of the desk stood Jim Irwin, and facing him was a smooth stranger of the old-fashioned lightning-rod-agent type—the shallower and laxer sort of salesman of the kind whose sole business is to get signatures on the dotted line, and let some one else do the rest.

Standing back of him in evident distress was Mr. Cornelius Bonner, and grouped about were Columbus Brown, B. B. Hamm, Ezra Bronson, A. B. Tal-

(Continued on page 148)

Give a thought to Advertising

WHY is a man who travels only at night like an unadvertised product?

Sounds like a sticker but its not half as hard to answer as you might think.

The man who travels only at night doesn't dare show his face in the light of day, and an unadvertised product doesn't dare show itself in the light of publicity.

They are both things to be avoided.

You certainly wouldn't trust the night prowler in your house—but how about the unadvertised product, the product that doest dare show its face in print?

When you get right down to brass tacks there isn't much difference.

A good product always increases its sales by good advertising, but a poor one inevitably fails if it advertises.

There's a sound reason for this: No matter how extensive or good the advertising of a product may be, still if the product itself isn't exceptionally good people won't buy it a second time; no more than they would trust a man the second time after they caught him lying once.

To sell a product in advertising, you have to give it a pretty good reputation; you have to say mighty nice things about it and claim all kinds of superior qualities for it. Then when people try it and it doesn't live up to its claims, naturally they won't buy it a second time.

Manufacturers know this—or they ought to by now. So when they have a mighty good product to sell they're not afraid to advertise it, because they know that publicity will increase its sales. All they have to do is to introduce it to people and they'll buy it again and again.

But, if their product isn't the best, and wouldn't live up to the good things they would have to say about it in an advertisement, they know that they would only lose money by advertising, for once tried, no one would buy the thing again. And if people only buy a product once the best advertising in the world won't pay.

The answer is simple. In the long run you protect yourself by buying advertised products. Maybe you'll get stung once or even twice, but not nearly as often as if you bought just any old thing that came your way.

Does it pay to give a thought to advertising? Just try and see. Then we'll bet that you'll agree, it pays many times over in just saving you from buying poor worthless stuff—for you'll find that advertising acts as a guide to the good things in life

NEW LAMP BURNS 94% AIR

Beats Electric or Gas

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal oil).

The inventor, R. M. Johnson, 642 N. Broad St., Philadelphia, is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him to-day for full particulars. Also ask him to explain how you can get the agency, and without experience or money make \$250 to \$500 per month.

Some Step-Saving Suggestions

Josephine E. Toal Praises the Pencil—Hints For Mothers

I HAVE turned over a new leaf in the timesaving primer. It is very simple. I have a pencil within easy reach wherever I am. From attic to basement I can always pounce upon one at a second's notice.

Of course, everyone expects to find pencils in the writing desk and on the telephone table. But it is a different thing when one has to run up or down a flight of stairs and back again for that little necessity which will never come when you whistle. Spill a few pencil stubs about the house in handy places and see how it works. You will want one on the kitchen mantle (if you have one), to write the grocery orders, figure household expenses, etc. Another in the kitchen cabinet or pantry will come in handy for making memoranda, writing recipes and labels.

All those bags, boxes and papers in the attic should be labeled. At house-cleaning time, just take a pencil and pad along up there with your broom and dustpan. You'll have plenty of of chances to use them. Leave them in the attic in a convenient place.

Did you get your bulbs mixed up last year because when you put them in the basement you made only a men-

tal memoranda that went back on you? Maybe it wasn't bulbs; perhaps it was seed potatoes, or you forgot how many dozens of eggs you laid down and when.

The summer kitchen? the woodshed? Sure! All the garden seeds garnered, the corn and herbs traced up, the left-over paints and varnishes—a multitude of things to be tagged.

Don't omit pencil and paper in the guest room. Your friend may have forgotten her fountain pen.

The pencil in my workbasket often jots down measurements. One in my machine drawer, along with a piece of crayon, is no less a timesaver.

You will want a pencil on the porch reading table for notes, and of course, plenty of nice long sharp ones in the library.

Snatch down a pencil from the rafter in the henhouse to mark eggs and make poultry tallies.

I always carry a stub or two in my shopping bag, and one in my pocket when I go to church (have you ever noticed the pencil shortage in church?), and tuck one in with a writing pad when I pack my suitcase for a trip.

Other Small Timesavers

Pins, buttons, needles, and thread—a supply on each floor in the house will save much time and vexation. The safety pin, convenient makeshift for the missing button or string, is ever a friend in need and should have an honored place in every bedroom and bathroom, as well as in handy baskets and drawers here and there about the house.

The ready string is as much a timesaver as the ready pencil. A ball of twine in the kitchen, the attic, and the basement saves many steps. A few sheets of heavy wrapping paper and a quantity of stout cord laid up in a convenient place, help out wonderfully in the hurried moment when a package is to be wrapped on short notice.

Save the heavy cord with which your flour sacks come closed, the bits of tow and rope tied about the burlap in which your new rugs and furniture were delivered. You will find them timely aids next summer for trying up shrubs and plants in the garden.

DONT'S FOR YOUNG MOTHERS

1. Don't let the baby eat between meals—not even bread or crackers. Have the mealtimes regular.
2. Don't forget to give water between meals.
3. Don't give over-ripe or under-ripe fruit.
4. Don't give the baby "tastes" of the adult's food. It doesn't pay!

READY SEPTEMBER 1

This is the cover of our fall and winter Fashion Magazine. Inside you will find page after page of smart new designs, for children, young people and

older women, and suggestions for Christmas gifts to be made at home as well.

There are also illustrated lessons in stitches you should know and in difficult parts of home dressmaking. All in all, it is a book you cannot afford

to be without, were the cost ten times its present low rate. Send 10c in stamps or coin (wrap coin carefully: stamps are safer) to our Pattern Department for your copy.

THE HANDIEST BABY-TENDER

The first requisite for a home-made "baby tender" is an old baby buggy, the sole qualifications of which are, that the wheels and springs are intact. Then you add a clothes basket and a can of pretty paint.

Remove the old body from the frame and fasten above the springs a light, solid platform. Paint it all neatly and if desired, paint the basket to match. Fix the basket so that it ties or hooks securely to the platform, yet may quickly and easily be removed. And keep all within proportions that will readily pass through a doorway. If the original handle is shortened and fastened to the platform, it will suffice to push the tender about the house.

Baby in this bassinette can easily be pushed from room to room without in the least disturbing him. When bath-time comes, push the tender to the desired spot, remove the basket, spread a warm blanket over the platform and it is the handiest place imaginable to bathe and dress the little one.

Best of all, when baby outgrows it—as babies have a disconcerting way of doing—the basket is always a convenience. And even the discarded platform on wheels will be found convenient in the laundry or to use on the porch.—ALICE MARGARET ASHTON.

The Brown Mouse

(Continued from page 147)

cott and two or three others from outside the Woodruff District. With envelopes in their hands and the light of battle in their eyes stood Newton Bronson, Raymond Simms, Bettina Hansen, Mary Smith and Angie Talcott, the boys filled with delight, the girls rather frightened at being engaged in something like a debate with the salesman.

Fair rates and good service

This country has enjoyed railroad transportation on practically a cheaper basis than any other civilized country.—Report of the Congressional Joint Commission on Agriculture.

Shippers of farm products on the New York Central Lines know from experience that the quality of railroad service is of greater importance than the price.

Inadequate, inefficient freight service is dear at any price. Rates that leave no margin of earnings on railroad investment dry up the sources of new capital, without which the carriers cannot provide the new equipment and facilities their shippers must have.

This necessary margin of receipts above expenditures, so vital to the life of the railroads, is a small fraction of railroad rates. In 1922 the railroads earned the largest net income in five years, a return of 4.14% on their property investment. But a reduction of 16% in the rates charged in 1922 would have taken all this net.

The Congressional Joint Commission of Agricultural Inquiry estimated that the average proportion of freight rates to the value of goods carried was 6%. If this were reduced to 5%, a reduction so small that the consuming public would detect no difference in living costs, most of our railroads would starve.

Living rates for the railroads—insuring healthy growth of railroad facilities—are vital to agricultural prosperity.

The New President's Wife

Mrs. Coolidge as Her Neighbors Know Her

HER neighbors run to her to be shown a new fancy work stitch.

She made a playhouse in the back yard for her young sons, from a piano box.

She likes picture puzzles and enjoys working them out of an evening with the boys.

She's a great knitter and hopes to win a prize for her original afghan, submitted in a recent contest.

She's called by the people in the village "an ideal backdoor neighbor."

Who's this? Some up-State Farm Bureau member or club leader?

Not at all. She's Mrs. Calvin Coolidge, wife of the new President, who has therefore succeeded to the highest title an American woman can claim—the simple one of "First Lady of the Land."

It is a hackneyed saying that any boy born in the United States may some day be President; we don't so often think that any American girl may be mistress of the White House. Surely the young Vermont teacher who visited the President's home with a party of tourists some years ago had no idea that she might preside there herself one day. And it's quite certain that the gruff old guard who warned her off when she rather enviously touched the famous gold piano (Mrs. Coolidge is a musician, too) had no idea that he had scolded a future President's future wife! Mrs. Coolidge can play on that

gold piano as often as she wants now, without fear of reproof.

Her story is just such a one as democratic, but romance-loving Americans like to think typical of this "land of the free," where almost anything may happen to almost anybody. She met her husband when she was teaching in a Northampton school for the deaf and he was a young law student. The rent of their first house was \$32 a month and they complained about the way the paint had peeled off the front porch.

Mrs. Coolidge is that rare woman who combines strong domestic tastes with real social ability. One neighbor will tell you she has helped her husband most by the way she has kept his home and brought up his boys, and another will say she's done most for him by her social charm and brilliance as a hostess and in public affairs.

Washington society has already had a chance to get acquainted with Mrs. Coolidge and found her a woman of delightful personality. But "the folks back home" are not a bit impressed by Washington's discovery—they've known Grace Coolidge all these years, and wherever she is, she's "the life of the party" and "just about right." And somehow one thinks that the verdict of her back-yard and front-porch neighbors means more to Mrs. Coolidge than all the "high society" in the world.

FIVE FALL PATTERNS FOR THE UP-TO-DATE WOMAN

No. 1823. Here is the dressy little frock for Sundays or evening wear. A comfortable style too, and the diagram shows how simple it is to make. It comes in sizes 16 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 2½ yards 36, 40, or 54-inch material with 3¾ yards of 6-inch ribbon for sash. **Price 12c.**

No. 1233 is a combination step-in and camisole, which is practical as well as dainty. It comes in sizes, 16 years, 36, 40, and 44 inches bust measure. Size 36 requires 1¾ yards 30, 36, or 40-inch material; 3¾ yards lace and 2 yards ribbon. **Price 12c.**

No. 1634 is the house-dress, necessary all-year-round. This is a trim little model, not hard to make. It comes in sizes 34, 36, 38, 40, 42 and 44 inches bust measure. Size 36 requires 3¾ yards 36-inch material with ½ yard contrasting. **Price 12c.**

No. 1304 is the "make-over" style for last year's silk or cloth, but is pretty in new materials too and has a wide range of sizes. Sleeves may be short or long. It comes in sizes 36, 38, 40, 42, 44 and 46 inches bust measure. Size 36 requires 1¾ yards 40-inch material with 1¾ yards 40-inch contrasting. **Price 12c.**

No. 1742, for the stout woman, has many possibilities. The original was in brown crepe-back satin with a colorful print vest. It has ideal lines for the full figure. **No. 1742** comes in sizes 36, 38, 40, 42, 44, 46 and 48 inches bust measure. Size 36 requires 4½ yards 40-inch material with ¾ yard 10-inch contrasting. **Price 12c.**

To Order: Be sure your name, address, pattern numbers and sizes are clearly written; add 10c if you want the new fall catalogue; put 12c for each pattern and send to Pattern Department, American Agriculturist, 461 Fourth Avenue, New York City.

You may as well Profit by the Saving this Book offers You

This Catalogue is free to you. You need merely fill in the coupon below. You, too, may just as well profit by the saving this book offers.

Over Fifty Years' experience in buying and manufacturing has gone into this book—to secure for you and your family the lowest prices and the biggest savings.

Over Forty Million Dollars' worth of merchandise has been bought when prices were lowest, and manufactured especially for this Catalogue.

Our World-wide Search for Bargains

Actually, our buyers have searched every important market of the world to secure for you these bargains. Nothing has been left undone to secure the lowest prices. And in all this work we have never lost sight of quality.

To offer only the kind of goods that is best for you to buy, that will give the longest service, that is our policy. We never sacrifice quality to make a seemingly low price.

"Ward Quality" Means Reliable Goods

When you buy from Montgomery Ward & Co., you get only goods that will stand inspection and use.

That has been our principle for over Fifty Years. To sell only Dependable, Serviceable Goods at the lowest prices possible—and always your money back if you are not satisfied.

Everything for the Home, the Farm and the Family

FOR WOMEN: Our own Fashion Experts, living in New York, have selected for you the best New York Styles, only the best. And we offer these for every member of the family, without the usual "fashion profits." You will be delighted with the big Woman's Section of this new Fall & Winter Catalogue.

FOR THE HOME: Experts in interior decoration have provided a treat for all women interested in beautifying their homes. Everything new in furniture, carpets, and decorations—everything practical and new in household devices, everything needed for the home this book offers at a big saving.

FOR THE FARM: For over Fifty Years, the American Farmer and Montgomery Ward & Co. have helped each other. We have helped and are continuing to help by offering everything for the farm at the lowest prices: Tools, hardware, tires, harness, everything a farmer uses is offered at a saving.

FOR THE MEN: Everything for the man's and boy's personal use. Our bargains in clothing alone make this book invaluable to every man. There is a saving on everything a man uses or wears.

And so we say to you—don't you, at least, miss the advantage this book offers you. You and your family may just as well profit by its saving.

The coupon below brings you this big, complete Fall & Winter Catalogue free.

Reviewing the Latest Eastern Markets and Prices

PREMIUM PRICES FOR LIVE POULTRY

HERSCHEL H. JONES

IN the New York wholesale live poultry market at this time of year it is customary for dealers to attempt to get premiums of 1c per pound or more above published quotations for heavy fowls. From early August on until after the Hebrew holidays in September and October the demand for heavy fowls is strong. At certain holiday periods the orthodox Jewish housewife uses only the fat from fowls for cooking, so that fat fowls are wanted in great quantities. This custom of charging buyers premiums for them has become so fixed that whatever quotations are given in the recognized trade market report, the dealers ask that much more. The buyers are quite stirred up over it. They claim that the wholesalers are demanding premiums for average heavy fowls, not only for fancy selected stock. The difficulty comes from the fact that a large portion of New York's weekly supply of live poultry is bought on the basis of quotations published a day or more after the sale. The buyers are very thoroughly organized, whereas the wholesale dealers are not, and in the last year the buyers have had dominant control.

This controversy relates primarily, of course, to the larger supplies of poultry that come to New York by freight from the middle west. It is of interest to the nearby express shippers, too, however. The live poultry business at New York has grown to huge proportions in recent years, a very large part of the poultry going to the special poultry slaughter houses for the Jewish trade. The Italians also consume a considerable quantity of fresh-killed poultry, but they have been more or less driven out of certain channels of the business by the well-organized Jewish dealers. The Health Department has made an effort to stop street peddling of live poultry, which was popular with the Italians, and has shut down on killing of poultry in other than licensed slaughter houses.

The total value of New York's weekly supply of live poultry is estimated at around \$1,500,000.

The accompanying table of wholesale prices of express fowls and broilers in 1922 and this year may be of value in gauging the possible trend of prices in the next few weeks. (Prices taken from Department of Farms and Markets reports.)

Express receipts of live poultry sold well last week when of good quality, but there was a large proportion of poor stock which was offered at inside prices. Wholesale prices August 23 as follows: Fowls, 25 @ 29c; Broilers, colored, 30 @ 31c; Leghorn, large, 29 @ 30c; average, 27 @ 28c; small, 23 @ 26c.

FEW FANCY NEARBY EGGS

The market held steady last week for fancy and extra fancy nearby white eggs and the top quotation on New Jersey hennerly whites, closely selected, extras, was advanced to 57c. The bulk of the receipts from nearby sections, however, were of medium quality, and sold within a range of 39 @ 48c, with undergrades down as low as 32c. Buyers became very critical and were willing to pay highest prices for only very fancy eggs. The medium and lower qualities moved slowly. The bulk of the supply of Pacific Coast eggs toward the end of last week was offered at 43 @ 46c. There was a tendency, however, for buyers to turn from Pacific Coast to nearby eggs of fuller and better quality. Cold storage eggs moved out of storage at New York last week at the rate of from 3,000 to 6,000 cases per day, whereas the movement into storage averaged less than 2,000 cases per day. The best qualities of storage eggs undoubtedly tend to hold down the market of fresh receipts.

The final Government report of cold storage egg stocks in the United States shows 10,503,000 cases, or 113,000 cases more than indicated by the preliminary report. This is in excess over last year of 342,000 cases, or a little less than 3.4 per cent. There was also an excess of frozen eggs in storage of

8,348,000 pounds, equivalent to about 260,000 cases of eggs in the shell.

In the four large markets a total of 5,935,746 cases of eggs have been received January 1, which is about 100,000 cases more than the same period in 1922. Wholesale dealers were complaining last week over the irregularity in the volume of Pacific Coast egg receipts, due to the occasional shipments

to feel that a peak had been reached temporarily, at least, and declined to buy further except for immediate needs. Toward the end of the week creamery extras (92 score) dropped from 44½ @ 45c per lb. down to 44c. There was some uncertainty as to further changes, but it is unlikely that this weakness will continue. The reports are, however, that the extreme of

WHOLESALE PRICES OF EXPRESS FOWLS AND BROILERS

Aug. 23.....	28 @ 30c	20 @ 24c	28 @ 30c	29c	27 @ 29c

of large quantities by steamer. These heavy irregular shipments tend to depress the market not only for Pacific Coast eggs but for all other classes.

THE HONEY MARKET

Activity is increasing in the honey market. The demand for buckwheat extracted for delivery around September 1 is good. Country buyers, however, are offering only 8 and 9c a pound. There is no stability to the market at New York City, prices quoted by dealers ranging from 7 @ 11c f.o.b. New York. The New York Journal of Commerce August 24 quoted honey as follows: Clover, comb case, \$3.50 @ 4, extracted per lb. 9 @ 11c; Buckwheat, comb crate, \$3 @ 3.50, extracted per lb. 7 @ 9c.

CHEESE ADVANCE

Because of larger speculative demand, and less favorable reports as to producing conditions, the cheese market advanced last week. On August 23, State whole milk flats, fresh, average run, were quoted at 25½ @ 25¾c lb., an increase of ¼c over the previous week. Some dealers were asking 26c. The following is the final August 1 Federal cold storage report on American cheese holdings:

U. S. COLD STORAGE HOLDINGS			
	Aug. 1 5-Yr. Av.	Aug. 1 1922	Aug. 1 1923
Cheese, American..	50,165	46,580	55,768

BUTTER REACTS SLIGHTLY

After climbing up rather steadily for some time, butter prices came to a standstill last week. Buyers seemed

low production has been passed. Many sections that suffered from drouth have recently had sufficient showers to bring them back into condition.

The demand for unsalted creamery is usually dull at this time of year and supplies are liberal. Creamery unsalted extras were quoted August 23 at 45 @ 45½c.

POTATO MARKET FIRM

Prices in the potato growing sections last week were firm, due largely to a good demand on Long Island for "shippers," field run, for export and for table stock outside of New York City. A few cars from the Island moved as far west as Pittsburgh, Pa. Shippers were loaded for \$1.46 per bu. in bulk; U. S. No. 1 stock for \$1.56 per bu.; sacked ones sold for \$4.50 per 150-lb. bag, f.o.b. loading station.

South Jersey quotations touched \$4.50 per 150-lb sack f.o.b.; Robbinsville section quoted 150-lb sack from \$4.35 @ 4.50 f.o.b.

Jersey U. S. No. 2 machine graded dragged at quotation from \$1.35 per 150-lb sack to \$1.50 f.o.b. loading point.

APPLE DEMAND LIMITED

Supplies of barreled and basket apples were light from Hudson River Valley sections last week, but heavy from New Jersey and Delaware. The demand was limited and market inactive, with highest prices realized on comparatively few sales. Large size, uniform fruit, of course, sold much more readily and bushel baskets were preferred to barrels. Following were

wholesale prices August 23 on Hudson Valley apples in bushel baskets: DUCHESS, 75c @ \$1.50; WEALTHY, 75c @ \$2; WILLIAMS, \$2 @ 2.75; MAIDEN BLUSH, \$1 @ 1.25; GRAVENSTEIN, \$1.25 @ 1.75; WOLF RIVER and ALEXANDER, \$1.50 @ 2; TRANSPARENT, 75 @ 1.50. DUCHESS, in barrels, best, brought \$4.50 @ 5; WEALTHY, best, \$4 @ 4.50.

Crab apples are coming in from Hudson Valley sections, but there is very little demand for them now. Some receivers are putting them into storage until after Labor Day, when people will have returned from summer vacations and take more interest in jelly-making and canning. It is a mistake to ship crab apples in barrels. They should be packed in bushel baskets, or 12 and 14 qt. baskets. Wholesale prices on crab apples August 23 follows: Per bu. basket, different varieties, best, small, \$3 @ 3.50; large, \$2 @ 2.50; poor to ordinary, \$1 @ 1.50; per 12 and 14 qt. basket, 50 @ 75c.

California shipped over 2,000 carloads of apples from the middle of June to August 18 this season, out of a total of only 5,148 for the whole country. This compares with 55 cars from New York State in the same period. It is no wonder California Gravensteins have been flooding our New York market.

DULL MARKET FOR PEARS

California has taken all the edge off the pear market for eastern growers lately. Out of total of 233 carloads of pears received at New York in the week ending August 18, 199 came from California and only 32 from New York State. The California boxed Bartletts have absorbed most of the fruit stand demand.

Clapp's Favorites, Bartletts, and Flemish Beauty are the varieties now in the market from New York State sections. Some Seckels from New Jersey and other sections. Clapp Favorites sold August 23, per bu. basket at \$2 @ 3.25, with the best mostly at \$2.50 @ 2.75. Bartletts \$1.75 @ 3, with best ranging from \$2.50 @ 2.75.

GOOD HAY IN DEMAND

Good hay was in active demand last week and the available supplies cleaned up fairly well. The prevailing price for No. 2 Timothy toward end of week was \$29 per ton. Some No. 1 Timothy reached \$32 per ton. Brooklyn was somewhat firmer than Manhattan.

CORRECTION OF ERROR

Owing to haste in getting last-minute data on crop estimates into our Market Page last week, two stenographic errors escaped attention. The total commercial apple crop for the entire country should have read 32,877,000 barrels, not bushels, and the apparent decrease in the New York State crop this year compared with last should have read 800,000 barrels and not 8,000,000 barrels.—EDITOR OF MARKET PAGE.

Quotations From Eastern Markets

The following are the prices at which farm products of special interest to eastern farmers sold on August 24:

Eggs, Nearbys (cents per dozen)			
New Jersey hennerly whites uncandled, extras...	55 @ 57
Other hennerly whites, extras.....	52 @ 55
Extra firsts.....	44 @ 48	42 @ 44	33
Firsts.....	39 @ 43	29½
Gathered, whites, first to extra firsts.....	39 @ 47
Lower grades.....	32 @ 38
Hennerly browns, extras.....	38 @ 46
Gathered browns and mixed colors, extras.....	37 @ 39	38 @ 40
Pullets No. 1.....	35 @ 38
Butter (cents per pound)			
Creamery (salted) high score.....	44½ @ 45	48 @ 49
Extra (92 score).....	44	46 @ 47	46
State dairy (salted), finest.....	43 @ 43½	44 @ 43
Good to prime.....	40½ @ 42½	36 @ 42
Hay and Straw, Large Bales (per ton)			
Timothy No. 2.....	\$27 @ 29	\$17 @ 18	\$26 @ 27
Timothy No. 3.....	23 @ 25	22 @ 23
Timothy Sample.....	16 @ 19

September League Prices

\$2.98 For Class 1—Milk Market Active

The Dairymen's League Cooperative Association, Inc., announces that the following prices have been voted for the month of September, quotations being given for milk produced in the basic zone of 201-210 mile zone from New York City for 3 per cent milk:

Class 1—For milk that goes into fluid consumption, \$2.98.

Class 2a—For milk going into the manufacture of cream, \$2.05 per 100 pounds. There will be differentials of from 20c to 35c per hundred added to the price, depending upon the disposal of the skim milk. These differentials hold throughout where the disposal of by-products are concerned.

Class 2b—For milk going into the manufacture of plain condensed milk, ice cream and cheeses other than mentioned in Class 2c and 4b, \$2.40 per 100 pounds.

Class 2c—For milk going into the manufacture of soft cheeses, \$2.35 per 100 pounds.

Class 3—For milk going into the manufacture of powdered, condensed and evaporated milk and hard cheeses, \$2.25 per 100 pounds.

Class 4a—For milk going into the manufacture of butter, the price will be determined by average New York quotations of that commodity of 92 score.

Class 4b—For milk going into the manufacture of American cheese, the price will be determined by average New York market quotations.

The price of \$2.98 for class one milk is the highest September price with the exception of 1919 and 1920. It does not equal cost of production, but comes nearer to it than the general price level of the past. Present conditions in the field have made the increase necessary.

The League reports that present indications are that the New York City fluid milk market will be active.

DIRECTOR OF LONG ISLAND FARM SCHOOL RESIGNS

G. A. Bricker, recently appointed acting director of the New York State Institute of Applied Agriculture at Farmingdale, Long Island, has submitted his resignation, which the Board of Trustees immediately accepted. Mr. Bricker apparently was not extremely popular with the farmers of Long Island or the Board. At least this is indicated in a statement of one of the Board members, E. R. Lupton, who is a prominent Suffolk County farmer and president of the Farm Bureau. Mr. Lupton said that the acceptance of the resignation represented the general sentiment of the Board.

Mr. Bricker was appointed in April to succeed A. A. Johnson, who resigned as a culmination of many attacks on his administration, ending in a strike of the student body. It is said that it seemed to be the faculty of both Mr. Johnson and Mr. Bricker, as well, to go out of their way to antagonize the farmers of the Island.

LONG NEWS IN SHORT PARAGRAPHS

At this writing the coal miners and operators have just broken off the conference which they have been holding at Atlantic City, N. J., in an endeavor to reach an agreement on which to continue on September 1. Neither side seems willing to give an inch, with the result that there is a big chance of another coal strike. American Agriculturist has constantly advised its people to lay in their winter supply of coal. Now there is more reason for that advice than ever.

* * *

Plans are now under way to conduct a State-wide poultry marketing survey in New York State. The New York State College of Agriculture, Ithaca, and the State Farm Bureau Federation are cooperating in the study which is expected to reveal many facts of vital interest and importance to poultrymen of the State. The survey has already been started in Suffolk County, under the supervision of the county agricul-

tural agent. A list of all poultrymen in the county having flocks of 75 birds or more, has been compiled, and questionnaires are being sent to each name appearing on the list. Summarization of the questionnaires revealing specific marketing information will be made by the poultry department of the State College of Agriculture. Based on the information received, it is expected that an adequate poultry marketing program for the State can be prepared.

* * *

The Government's crop reports now estimate that the Nation's potato crop will be 379,558,000 bushels. The earlier estimates were larger. In the last few weeks potatoes in several of the States have not done so well and some shrinkage is indicated in the States of Minnesota, New York, Pennsylvania, Colorado and Utah. Last year's crop was 451,185,000 bushels.

* * *

Overproduction is the seat of our troubles. One way to cut down production profitably is to pasture more of the poorer meadows.

* * *

Over two million farms in the South are devoted chiefly to the production of cotton. On the average, there are thirteen million bales of cotton produced yearly between Albermarle Sound and the Rio Grande River. This is double the amount grown in all the rest of the world, and is the basis for the old slogan that "Cotton Is King." Despite this fact, the cotton farmers are nearly always distressingly poor. The American Farm Bureau Federation is authority for the statement that every year a million children are robbed of their birthright of school and opportunity because they have to work in the cotton fields to eke out the pitiful subsistence of their people. The standard of living among any class of farmers in the United States. There are two reasons for this; one is the one-crop system, which is the lowest form of farming, being nothing more than a high-class gamble; and the other reason is the lack of any protective selling methods or co-operation among the cotton producers. More diversified farming, coupled with cooperative marketing, is now developing in the South, which will in time surely bring about better days in Dixie.

Ducks By the Acre

(Continued from page 145)

After the ducklings are thoroughly chilled, they are weighed and packed in barrels, placing alternate layers of ducks and cracked ice. On the top of the barrel a good header of cracked ice is heaped and this is held in place by a piece of burlap tacked to the sides. The barrels of dressed ducklings are shipped to New York City either by a night train or by an automobile truck which makes the trip at night.

Long Island duck farmers have not been content to raise ducks efficiently; they have also undertaken to insure their sale to the best advantage. To accomplish this they have formed a co-operative association, which maintains its own place of business in New York City and which receives the dressed ducklings and negotiates their sale. When the receipts are in excess of the market demand at a fair price, the surplus is placed in storage and later drawn upon for use when receipts are light. In this way a continuous supply of Long Island ducklings is assured for the market and at the same time the general level of prices is maintained at a price more favorable to the growers.

Many of these old Long Island duck farmers began business in a small way with little more in the way of assets than a thoroughly practical knowledge of duck raising gained by experience on other duck plants. From these humble beginnings they have built up businesses which represent investments of from \$20,000 to \$50,000 or more. Ducks alone did it.

Hoffman's "Leap's Prolific" Seed Wheat

Here is real Seed-Wheat—the right variety—cleaned the way seed should be—and offered at a price you can pay! In 11 years of actual use in all winter-wheat-sections, "Leap's Prolific" has earned its right to leadership, and today stands as the best-liked, most dependable variety. This seed has meant increased yields of 5 to 15 bushels per acre to hosts of others. Sowing your entire acreage with it this fall, even though wheat-values should remain unsatisfactory, will show you better profits than are possible with any other Seed.

Heavy Yields: This year as high as 44½ bu-per-acre has been gotten. Several had yields of 40 to 42 bu. One grower has averaged 35 bushels for the past eleven years. An Ohio customer had 12-bushels more per acre than from his other wheat—a West Virginia user, twice the bushels made by another variety.

Tall, Stiff Straw: Stands up remarkably—did not lodge when other wheats alongside went down badly.

Large, Hard Grain, Does Not Shatter: Millers prefer this wheat for flour. Longberry type grain, finest quality. Stands rough handling, practically none shells out.

Great Stooler—You Save Seed: This means money to you. Don't sow more than 1½ bu. of this seed per acre—positively. Every grain counts. Sell your other seed-wheat, and it will nearly pay for this new seed. Costs you very little to change to this seed. Its extra stooling ability insures abundant stalks and heaviest yields.

Suited for All Soils: "Leap's Prolific" has been given fair trial for many years on highland, lowland, limestone, gravel, slate and clay soils—rich, medium and thin soils—and has come out well on all of them. "Leap's Prolific" will pay you!

Closely Graded Seed, Clean, Priced Right

This seed produced here in these fertile Lancaster Wheat Valleys. Graded to perfection by our powerful and most modern outfit. Was harvested in good weather—perfectly dry—grain is well filled, bright color, strictly sound germination. It is free from cockle—rye—garlic—cheat—and other weeds. Will pass most critical inspection, and please any wheat grower. Seed is now packed in good cotton bags—ready for immediate shipment. When the "LEAP'S PROLIFIC" you order reaches you—examine it. If it does not suit you, return it. We will refund your money and pay freight for round trip. We could not afford to make this offer if our "Leap's Prolific" was not first class Seed. No paper would print this offer if they did not know we can back it up.

PRICES: 1 to 14 bu. at \$1.95 per bu. 15 to 59 bu. at \$1.90 per bu. 60 bu. and over at \$1.85 per bu. Bags are free. On five or more bushels we pay the freight to any station in Ohio—N. Y.—Pa.—Va.—W. Va.—Md.—N. J.—Del.—Conn.—Mass. Customers not in above freight-paid territory may deduct 18c per bu. from above prices, then we'll ship charges collect. Send payment with order. Your check will do. Order today.

A.H. HOFFMAN, Inc., Box 60, Landisville, Lancaster Co., Pa.

Give Her a Chance

Nowadays it isn't necessary for the housewife to spend a lot of time cleaning up coal dust and ashes in the sitting room around the stove. With a Moncrief Pipeless Furnace in the basement, along with the coal and ashes, she has a chance to enjoy herself.

The whole family will enjoy the uniform, humidified heat that circulates throughout the home. No cold, drafty floors in cold, windy weather with a Moncrief Pipeless Furnace.

Moncrief Pipeless Furnaces are reasonable in cost and save fuel. *Write today for catalog.*

What's the Farmer's Test of a Tire

Simply this: Tires that do a farmer's work at the least ultimate cost; tires that meet the road conditions he must meet; tires that will take him back and forth between his farm and town.

Silvertowns meet his test.

Stop, and think it over. The first tire had to meet road conditions now found in the country. Goodrich, the pioneer tire maker, couldn't choose the roads for its tires any more than a farmer can choose his. So Goodrich built tires to meet them.

Your dealer sells Silvertowns, Goodrich "55" Clincher Fabrics, and Goodrich inner tubes.

A Tribute to the "National"

"A TRIBUTE to the genius of man" is how the National Dairy Exposition, which will be held this year on the State Fairgrounds at Syracuse, N. Y., from October 5 to October 13, is described by one of New York's farm leaders:

"It's wonderful," he said, "when one stops to think how the work of man has produced such wonderful and inspiring results as are shown at the Exposition every year. You have only to look at the cattle led into the ring; then think back to the cattle our grandfathers, even our fathers, had."

"Then, walk into the buildings which house the great exhibits of dairy machinery and equipment, all the wonderful devices which have made this country one of the greatest dairy nations of the present day, because it enables us to get milk and dairy products to consumers most efficiently."

"That machinery is actually awe-inspiring when you consider the 'hand dipping' methods of only a few years ago. Think of the lives saved by pasteurizing equipment, by cleaning and cooling devices; think of the promotion of better health and greater strength which improved methods has brought about, making ice cream, butter, cheese, and other dairy products more easily available to the consumer."

"Have you ever thought that the National Dairy Exposition plays a great and significant part in this work by bringing together, once a year, all the finest types of pure bred and grade dairy cattle; by showing farmers how they can improve their herds and increase their prosperity; by making the Exposition a clearing house of ideas in the machinery and equipment field; by bringing to the attention of dairy products' manufacturers the economic value of labor-saving, sanitary, efficient machinery? The National Dairy Exposition is a fine and needed institution, and I hope everyone who can—dairy farmer, manufacturer, dairy products' executive, and consumer—will take several days to visit the show and learn the real scope of a tremendous and vital industry."

CITY OF SYRACUSE READY FOR THE "SHOW"

Syracuse is taking the National Dairy Exposition seriously, and through its Chamber of Commerce and other civic bodies has resolved to maintain its reputation as the "City of Unbounded Hospitality." No detail of the matter of hotel accommodations for guests is being overlooked by those responsible for the physical needs of visitors. The Rooming Committee, which has charge of this work, is cooperating with the local Chamber of Commerce in the arrangements for handling a record attendance and special efforts to care for the comforts of the thousands of visitors are being made by men and women experienced in this sort of thing.

The wise ones are arranging for accommodations now. October 5 is not far away, and the slogan, "On to Syracuse," will soon be a reality. If your heart is in dairy business, you will not fail to attend the greatest dairy exposition ever held, but the earlier you make your hotel reservations the better will the Rooming Committee be able to care for your personal comforts.

WORK ON COLISEUM PROGRESSING RAPIDLY

The great Coliseum, now under construction on the State Fair grounds at Syracuse, N. Y., at a cost of \$500,000, will be the center of a great exposition of the dairy industry when the National Dairy Show is held on the fair grounds October 5-13. It is to be, without doubt, one of the finest buildings among the fine ones already known to farmers.

Work on the mammoth building is now progressing rapidly. Steel framework is being erected under pressure and the contractor has promised W. E. Skinner, general manager of the national show, that everything will be in readiness on October 5, when the doors will be thrown open. It is of gray brick, uniform with the other buildings, and makes a splendid addition to the grounds.

continuous service since 1917 and not one cent for repairs 'Z' engine

Says R. Stanley Dutrow, Walnut Grove Stock Farm, Charlestown, W. Va. "That 1½ horse Fairbanks-Morse Engine that I got of you is certainly some horse for work. The only REAL engine I ever owned." Says Silas A. Smith, Oakboro, N. C. "The engine I purchased from you in 1917 has been in continuous service ever since and has not cost one cent for repairs."

Over 350,000 users have approved the "Z" Engine. No matter what your power requirements, there is a "Z" Engine to exactly suit your needs. Over 5,000 dealers carry these engines in stock and will save you money on freight.

Did You Ever See a Plowing Contest?

Old Volumes Say It Was Once a Leading Attraction at the State Fair

THE 83rd annual New York State Fair will be held at Syracuse, next week. Hundreds of thousands of people will visit that great exhibit of the agricultural wealth of New York, a mammoth display of the great diversity of agricultural products of the Empire State—

By FRED. W. OHM

one instance, mention is made of the poultry exhibit, which consisted of two geese.

Some years ago George B. Howe prepared a short, but very interesting history of the State Fair, taking the facts from the reports of the old New York Agricultural Society. "On a distant day in April, 1841," he writes, "a small committee met in the city of Albany, and called into existence the progenitor of our modern State Fair by adopting the following resolution:

Resolved, that the New York State Agricultural Society will hold its annual Fair in the village of Syracuse, on Wednesday and Thursday, September 29 and 30, next.

"More than nine years before, in February, 1832, a few zealous and enlightened friends

of agriculture," as the records tell us, assembled in Albany and decided to form a State association. They selected as President James Le Ray De Chaumont, a famous French refugee and land owner, whose family name a town and village of Jefferson County now bear. The declared object of the society was "to promote the organization of county or local societies of agriculture and horticulture, as a means of exciting laudable emulation and promoting habits of industry, economy of labor and improvement in the moral and social condition of society." More specifically, it aimed "to establish agricultural schools and to hold annual fairs." The agricultural fair was even then an ancient institution; but this mention of agricultural schools as a need of the time, is a reminder

that the farming industry of New York State had clear-headed and far-seeing leaders eighty-five years ago, long before most of the mighty prairies of the West knew the touch of a plow or a harvester.

By a strange coincidence the first State Fair was held within an hour's walk of the present permanent site. It visited several cities before it came again to the "Salt City." Regarding its movements, Howe says: "It traveled from city to city like a monster caravan. In the course of its rounds, covering a period of nearly half a century, no less than eleven communities were visited by the Fair, some of them repeatedly. As a result of this polite distribution of favors, the matter of geographical convenience was subordinated. So long as the Fair was "passed around," even the cities at the extremes of the State insisted upon having their share. But the movable Fair was unsatisfactory for many reasons and more than a quarter of a century ago it cast anchor in Syracuse."

Following is the list of the various locations of the Fair in its fifty years of migration:

Albany, 1842, 1850, 1859, 1871, 1873, 1876, 1880, 1885, 1889.
Rochester, 1843, 1851, 1862, 1864, 1868, 1874, 1877, 1883, 1887.
Elmira, 1855, 1860, 1869, 1872, 1875, 1878, 1881, 1884, 1888.
Utica, 1845, 1852, 1863, 1865, 1870, 1879, 1882, 1886.
Syracuse, 1841, 1849, 1853.
Buffalo, 1848, 1857, 1867.
Saratoga, 1847, 1853, 1866.
Watertown, 1856, 1861.
New York City, 1854.
Poughkeepsie, 1844.
Auburn, 1846.

"From all accounts," writes Howe, "the people of Syracuse village took a loyal interest in the infant enterprise. The old Syracuse Courthouse, destroyed by fire in 1856, and a fine grove then stood to the northeast of it, were the main features of the first State Fair site. The pens for the animal exhibits were erected in the grove, while the

courthouse was thrown open for the array of farm products, implements and specimens of domestic manufacture. But the variety of exhibits overtaxed the capacity of the structure, and we can readily understand the complaints of overcrowding when it is stated that between ten and fifteen thousand persons visited the Fair. The amusements of the Fair seem to have been chiefly furnished by the village, but a special event in that line was a plowing contest on a farm in the Onondaga Valley. Nor was good cheer of a substantial kind lacking, for we are told that the proprietor of

(Continued on page 161)

The old Syracuse Courthouse, the birthplace of the State Fair in Syracuse village in 1841

grains, grasses, fruit, vegetables, flowers, cattle, horses, swine, sheep and poultry. Added to these are the extensive exhibits of the various State departments and institutions, manufacturers of farm machinery and automobiles and household conveniences. It will be the Mecca of agricultural New York to say nothing of the thousands of city folks who will flock there.

In that great throng of visitors there will be some who can remember the Fair before it came to Syracuse permanently. There will be those who will recall the Fair in its migratory career when it was held at Albany, Rochester, Elmira, Utica, Saratoga, when it went as far North as Watertown, and far West as Buffalo. There may be a few folks who recall that far day when it was held in New York City in 1854. The man or woman bowed with age must have a splendid memory indeed whose mind brings back the gatherings at Poughkeepsie in 1844 or at Auburn two years later.

History is always interesting, local history especially, which deals with places and things we know about. That is what makes the history of the State Fair so interesting. It is most interesting to look over old volumes of American Agriculturist and read the articles and comments on the State Fair exhibits back in 1843 and 1844. Evidently the exhibits were not very extensive at times, for in

Part of the present Fair grounds, with the Dairy and State Institutions Building on the right. The latest addition to the several beautiful gray brick, permanent structures is the Coliseum which will be completed in time for the National Dairy Show which will be held October 5-13

A Farmers' World's Fair

THE chief reason for a Fair or Exposition is to give folks a good time, and farm people as a rule have too few changes to get away from the daily grind of farm work.

But the fairs also have another good excuse for their existence and that is in their educational value. One of the greatest main-springs of human action is emulation which is but another word for competition. "Keeping up with the Jones's" is all right as long as the Jones's set a good example, and the Jones's who strive with one another to put on exhibits at fairs of products that excel, do much to give those who visit their exhibits, ideals and examples that they can very profitably emulate. When you see a large pumpkin, a plate of nice apples, a beautifully baked loaf of bread on exhibit, you think to yourself, "I'll bring one next year that'll knock the spots right off'n that un."

Back in the days before the printing press and rapid communication and transportation, the great fairs in England and on the continent of Europe did more than any other single factor to educate the people of one part of the country as to the best practices and customs in the other parts. The same is true to a somewhat less extent with our own World Fairs held in Philadelphia, Chicago, St. Louis and Buffalo.

And now we are to have a World's Fair in the dairy industry. In the meeting of the World's Dairy Congress and the National Dairy Show to be held in Syracuse, October 5 to 13, we are to see the greatest coming together of dairymen and milkmen with all the paraphernalia of the trade that the world has ever seen. Delegates to the show are now arriving almost every day from nearly every country in the world. These men will bring the last word of dairy progress in their own countries. The Swiss will be here to tell how dairying is done and dairy products manufactured in the Alpine country, and there will be delegates from the original home of the Holstein-Friesian cow as well from the Isles of Guernsey and Jersey, and from Scotland's mountain vastnesses from whence originally came the Ayrshire.

There will be individual entries of all dairy products, and farmers of the East are interested in the fact that their exhibits will be shown alongside of those of farmers of the West, thus giving striking and valuable demonstrations of different methods used in various countries of the world and various sections of the country. Best of all this is a show for the average dairymen from back in the hills. Thousands of grade cattle will be on exhibit and the needs and interests of the small farmer will be especially looked after.

Because the exposition is the greatest thing of its kind that has ever been planned, having a vital and practical message to both farmers and city people, and because it is being held in Syracuse in the center of the East, easily accessible from any section of the country, it is expected that from two to three hundred thousand people will attend. We hope that you will be among the number, because we are sure you will have a good time and that it will renew the interest in your business. Hotel and rooming reservations should be made immediately.

"Fifteen Die — Scores Hurt"

ONE cannot pick up a newspaper without reading headlines like the above about automobile accidents. Hundreds of people are horribly mangled and killed every day by automobile accidents. What is the answer to the ever-increasing number of cars and poor drivers?

Every road is full of them even in remote places. The speed and driving is more often than not, reckless and dangerous and no matter how carefully you may drive yourself, the chances are that sooner or later you will figure in an automobile accident through no fault of your own.

We had this brought emphatically to our minds some two weeks ago. We were driving at a moderate speed not exceeding twenty-three or twenty-four miles an hour. An old man who was deaf and who never should have been allowed to touch an automobile wheel came at a speed of at least twenty miles an hour out of a lane completely shaded by trees. He was going so fast that the tracks of his automobile showed later that it had been necessary for him to cover the whole of the main road when he turned into it from his lane.

When we saw him, we blew the horn and put on all the brakes. But he was deaf and could not hear the horn and his manner of coming into the road left no opportunity whatever of escaping from going into him which we proceeded to do, badly smashing both cars.

Sooner or later drastic action must be taken to prevent the great toll of human life that the automobiles are taking. Perhaps the solution will come through the air. The time is not far distant when there will be many who will travel the "air lines" in cheap and comparatively safe aeroplane "flivvers," thus relieving earth's crowded highways.

They Made Their Own Market

MUCH has been said about the success of the cooperative fruit organizations of the Pacific Coast, and particularly of their ability to sell their products to such good advantage in the eastern markets. What the western grower has done in marketing his products is one of the most interesting trade achievements of modern times, because of the obstacles which had to be overcome. Success was due to cooperation and to advertising which was followed up by splendid sales methods. A friend who has just returned from a trip to the Pacific Coast has brought to our attention some of the pamphlets which these western organizations use to convince the proprietors of the retail fruit

stores, and sales-stands of New York and other eastern cities how they could make money handling western fruit.

One excellently written pamphlet is entitled "How to Retail Fruit Efficiently." This book, written in a language and with illustrations that a child could understand, shows the retailer to the last detail just how he should handle the western fruit, just how to sell it, and the percentage of profit that he should charge. The pamphlets are written entirely from the retailer's standpoint. Simple explanations are given showing such details as how the number of apples in a box differs as the size of the apples differs, and how to figure the selling price and retailer's profit on each size and grade.

The booklets contain little hints to the retailers, such as "be fussy about the apples you sell," "the value of knowing the season for each apple," and "sell the right apple at the right time." Only a few leading varieties are suggested under this last title. One of the mistakes that eastern growers make is producing and attempting to market too many different varieties.

Fruit men throughout the east are looking forward with a great deal of interest to the coming Apple and Fruit Exposition in the Grand Central Palace, New York City, in November because it marks one of the first efforts on the part of eastern growers to follow the westerners' example by paying more attention to the actual merchandising of their product. This means not only the production of high quality fruit, but also properly grading and packing that fruit and then, most important of all, following it through to the consumer by cooperating with every agent who handles the product.

Still They Come

ON the opposite page we are giving the first count of the prohibition votes received up to and including August 25. This is just to give you an indication of how the vote is running. They are still coming in at the rate of several hundred a day and we expect that they will continue until well in the fall. If you have not voted, or if the subject has not been discussed in your church, local farm organization or other body, won't you send to us for some ballots and help us to register as large a rural vote on this important question as possible?

A Usual Transaction

A FRIEND of ours recently told us this little story which we believe worthy of passing on to you. It seems that this friend was partaking of some ice cream in a Greek fruit store in a small town. While he was there a farmer came in with some strawberries and asked the proprietor to buy them. The Greek looked them over, said that they were poor—anyway he didn't want them.

The farmer had the usual mental attitude of wanting to "get rid of his product" instead of selling it as a good salesman would, so he let the Greek know that he was very anxious to dispose of his berries. After some more talk, in which the proprietor kept belittling the farmer's product and telling him that he really didn't care for any berries, he finally bought them for something like 8 cents a quart.

Five minutes after the farmer had gone out, a lady came in and asked the Greek if he had any strawberries for sale. "Yes," he said, "we have some of the finest I have seen this season, just off the vines." The lady asked the price and was informed that they were 20 cents a quart. She bought some and departed.

In that little transaction is the answer to about nine-tenths of the hard times of farmers, and in reaching your conclusion don't by any chance blame the Greek.

The Plain Case of the Dairy Farmer

A. A. Radio Talk Broadcast from WEAFF, September 5, at 6:50, Standard Time

By GEORGE W. SLOCUM

President of the Dairymen's League Cooperative Association, Inc.

I AM indeed glad of this opportunity to talk to you on a subject about which we have heard a great deal of late. From pulpit and platform, in the press and over the radio, everybody is discussing the farmer and his peculiar problem of existence, and everybody has a quick and sure remedy of his own to offer. One more voice remains to be heard that should be at least as well qualified as any other to enter the lists. I refer to the farmer himself, and I should like to show you a different slant of the question from his point of view.

It is strange that this industry, perhaps the most human, certainly the most necessary in the whole line of men's work, if men are to continue to work at all, should be the least understood. We all agree that the nation must be fed if it is to exist. So much is simple. But what about the men who are feeding the nation?

We know about improved working conditions in the manufacturing and industrial world; what the unions have accomplished as to hours, health regulations, workmen's compensation acts, and innumerable other things all calculated to make life more livable for the great body of industrial producers upon whom depends the world's commerce. We know how they have fought and won their right to contract, individually or collectively, when and where and how they shall give their labors. We know that their employers have so arranged the wage scale and overhead expense, as to leave a comfortable margin for cost of production and more or less reasonable profit to themselves. We know that in the last few years the cost of those products to the consumer has risen over 60 per cent, and nobody grumbles about it particularly.

But do you realize that farmers have no union? They work long and late. If drought or excessive rains, or cold or withering heat destroy their crops, and with those crops, the work and expense and hope for profit, of an entire season, nobody compensates them. It is just dead loss. Another absolute fact upon which I feel I cannot lay enough stress, is that except in a few rare instances dairy farmers do not receive as much for their milk as it costs them to produce it. Do you see what that means? That at the end of the year, when they should get back all the money they expended in necessary expenses, plus a legitimate reward for their labor, they have been facing a deficit instead.

What do we, the dairy farmers, propose to do about it? Do we want Government assistance? Do we want Government purchase of surplus stocks, or price fixing by the Government, which is only another name for piling additional taxes upon an already overburdened public? We do not.

We neither ask nor desire any special privileges. We will never solicit a legislation benevolent to us, that must be paid for by all the rest of the people. On the contrary, instead of indirectly increasing the price of milk to

the consumer, because of course, all Government appropriations must ultimately come out of the pocket of the public, it is an integral part of our program to lower the price of milk.

We feel that we can work out this problem

our cooperative undertaking. But we want something more than that; something even higher. We want the moral support of the public—of the whole public. We are bending every ounce of intelligence and energy on the problem of eliminating every unnecessary factor, of rendering more simple and direct the machinery of distribution, now altogether too cumbersome and complex.

We, of course, haven't the means or the influence to bring down the high cost of other products, and must manage as best we can with the absolute necessities, cutting out all thought of luxury. But we can and will lower the cost of milk to you, the consumer, and at the same time do justice to the dairy farmer.

It is entirely possible, and it is the aim and pledge of the Dairymen's League Cooperative Association to put the dairy industry on a safe and sane and permanent economic basis, and to give the consumer the benefits that must accrue from a combined policy of intelligent and orderly cooperation, together with an entirely revised and improved distribution service. To give justice to the dairy farmer, to eliminate every unnecessary cost between cow and milk drinker, to sell milk of a higher quality at lower prices, is our slogan.

It is true we now have legal sanction in

ourselves. Work it out, that is, with your help and understanding and encouragement. We ask no greater right than we are willing to concede to our fellow workers in other fields. We who feed you, want the same privileges that you grant to the men who clothe you. We want without question to cooperate, to sell our milk collectively, to get for it at least as much as it costs us to produce, with just enough more to feed and house our wives and children decently, to educate them to the task and duty of good citizenship.

It is true we now have legal sanction in

A Good Time to Buy a Farm

THERE is no denying it, farmers are badly off this year, although they are saying less about it than would be expected. When it comes to standing up against a difficult or discouraging situation, farmers maintain their position longer and say less than anybody else. They face discouragements with the utmost fortitude.

That is partly the reason for thinking that farming is coming back to its own. It is a good time now to buy a farm if you want one. Farm lands have not fluctuated in New York State as they have in some sections of the country, but they average much lower than they did two to five years ago.

The question immediately comes up: "Why buy a farm if farmers are making no money?" The next question is: "Will there be a chance to make any money later on?" The answer to the second question may answer the first. In going about the State a little in the past few months I have seen so many evidences that some farmers will work in town next year that I think production may be lowered a little even with the same weather conditions. Other farmers are considering reducing. Both of these are desirable and they point the way for some man to buy a farm. Wages for labor are high in comparison with returns from farms, but that of itself may aid in establishing our prices a little. Everybody works who wants to. We have had one of the most disastrous years for the eastern farmer that has been known in 25 years. My idea is that next year will be a little better than the present.—H. H. L.

The Prohibition Vote

THE following is the result of the American Agriculturist rural Prohibition vote up to and including August 25. The ballots are still coming in—several hundred every day. Have you voted? If not, send in your ballot and get your Grange or other farm organization to take a vote. Ballots will be furnished free of charge upon request.

For the Eighteenth Amendment as it now stands.....	6,612
For Modification of the Eighteenth Amendment.....	811
In favor of Prohibition.....	88%
Grand total of ballots received.....	7,423

PROHIBITION BALLOT

OF THE

AMERICAN AGRICULTURIST

Are You for the Strict Enforcement of the 18th Amendment as It Now Stands? ☐ YES ☐ NO

Are You for a Modification of the 18th Amendment to Permit Light Wines and Beer? ☐ YES ☐ NO

Designate your opinion by placing an X in the square opposite Yes or No on each question. Sign your name and address. Your name will be kept *strictly confidential*.

Why You Should Vote

Do the American people want prohibition? The Wets emphatically say "No" and the Drys are even more emphatically for it. Both sides claim a majority. Which is right? What do farm people think about it? The opinions of farmers on any problem, if they will express them, go far in determining the outcome of a controversy.

American Agriculturist is taking a vote of farm families on the question of prohibition. It is a vital issue and whether you are for it or against it, be sure to vote in the spaces above. Mail this ballot to the American Agriculturist, 461 Fourth Avenue, New York City.

Get your friends to vote—More ballots furnished on application

Cut Down Acreage

A Time For Sanity and Sane Thinking

EVERY period of economic distress among farmers such as we are just now passing through, brings to the surface a lot of loose thinking, and foolish talk, and impossible demands, and silly economic theories, mainly taking the form of legislative panaceas.

J. VAN WAGENEN, JR.

It was about twenty-seven years ago (I cannot verify the exact date) when Coxey and his grotesque "army" made his famous "march" on Washington. It was a spectacular, half-ridiculous, half-pitiful protest against a long period of agricultural "hard times" which reached their lowest depths about the middle of that bad decade, 1890 to 1900. With all due respect to present troubles, I still insist that any farmer who "came through" that period and lived to tell the tale is entitled to smile an amused, superior sort of smile when our present agricultural depression is referred to. Those years, when all over our State the shipping stations paid 44 cents per forty-quart can of milk (the fat test was not yet generally introduced), and when in butter and cheese it brought even less, established a low quotation which no one ever expects to see again duplicated. Lest I seem to claim glory for myself as having lived through that period, let me hasten to add that it was my good father—not I—who was bearing the burden and doing the worrying. These were the years that begat the "16 to 1" craze and various other economic vagaries.

However, let us grant that the three years past have been bad enough, and much worse in the West than with us. We men of the East are fortunate in that we never really lost our heads over land values during those two or three boom years. As we know, the Corn Belt indulged in a wild spree of buying, and selling, and trading, and marking up the price of lands, and because after it is over, thousands of men find themselves saddled with farms for which they promised to pay fictitious prices, the present depression comes all the harder. By the way, these men are not wholly to blame. Many claiming to be much wiser than they, also had visions, and dreamed dreams. Even before the war, James J. Hill, famous as a railroad present and speechmaker, furnished scare headlines about an impending food shortage in America, a prophecy that seems particularly absurd in the light of subsequent events. Then an almost equally well-known banker-economist electrified his audience by declaring in so many words that within ten years every acre of good land in America would be worth not less than \$500. I judge we must have all been more or less bitten by the same bug, for I do not remember that when I read this statement I recognized its folly.

In any case, events have demonstrated that our hindsight is much better than our foresight. And here am I, adding yet more words to the millions that have been written concerning our agricultural readjustment.

Just now there is a topic that has broken into all ranks of society and is learnedly discussed by all sorts of peo-

ple, some of whom would not know a wheatfield from an onion patch—viz. the price of wheat. Wheat is conspicuously the sick man of our agriculture. It surely behaves badly enough. Recently it has fallen not only to pre-war prices but worse than that. One must go back nearly fifteen years to find the parallel. Then, at Kansas City recently wheat and corn sold at the same price. So wheat has succeeded in getting on the front page of the daily papers, and such leading magazines as the "Outlook" give it the place of honor on the editorial page.

Now, so far as the East is concerned, this disaster to wheat is not directly a very important matter. Only about a half dozen New York counties grow wheat enough to cut any real figure in their agriculture. The State, as a whole, is most interested in having cheap wheat for chickens and the by-products for the cows.

More than other grains, wheat tends to be grown in the remote corners of the world and by the States on our agricultural frontier. There is a far larger portion of the world where wheat is successfully grown than corn, and the really high-priced land in the United States is the corn, rather than the wheat belt. The fact that wheat has such a wide range of adaptability, both as to temperature and rainfall, is one of the reasons why it has

chronically hard going in the world. Wheat constitutes less than 7 per cent of our total agricultural production and, as a whole, a depression in wheat prices is much less serious than with corn. Still, to the popular non-agricultural mind, there is something extraordinary in the over-production of the grain, which by common consent is the bread grain of all peoples just as soon as their

economic condition will permit them to use it in place of the cheaper cereals.

Now, it needs no international congress of learned doctors of either economics or agriculture to determine just what is the matter with wheat. Facts are that under the stimulus of high prices, together with a good deal of "grow more wheat" propaganda, the larger part of the wheat-growing world speeded up production and had not yet slackened up fast enough to accommodate itself to post-war conditions. Always in America we grow more wheat than we can use for bread, and, broadly speaking, the price at which the surplus can be sold determines the price for the entire crop. This year it is said that there is from 160,000,000 to 250,000,000 bushels (I take the minimum and maximum estimates) that must be sold abroad, and when it gets there, it must be sold to the highest bidder in competition with the wheat from Argentina, and Australia, and Canada, and India, and the Balkan States.

Some statisticians say that even Russia, generally supposed to be out of the game for some years to come, will be found adding her quota to an already overstocked market.

What are we going to do about this situation? Well, for one thing, we are already planning a fairly radical reduction in our acreage. The preliminary reports to the United States Department of Agriculture indicate a reduction of the winter wheat acreage of more than 15 per cent. This comes about not as the result of any studied propaganda, but simply because farmers do rather rapidly adapt themselves to changing market conditions. This is sound economics and as it should be. Then we ought to recognize that there is nothing sacred about wheat

SKINNER APPLE AND PEACH SIZER

Does Work of Five Machines. Compact, convenient and less expensive to install and operate.

Combines self-feeding hopper, roller grading belt, cull belt, sizer, distributing system. Dependable; thorough, widely used by experienced packers.

SKINNER MACHINERY CO., Fourth St., DUNEDIN, FLORIDA

SILOS I have a chance to sell by mail at my usual LOW PRICES the output of a well-known silo concern. Silos absolutely first-class, made of genuine CLEAR FIR. This lumber is high-priced and hard to get this year but YOU KNOW it is the ONLY SAFE wood for silos. If you buy through me DIRECT FROM THE FACTORY you can BUY THE BEST and PAY LESS. Your neighbor probably bought at my sale last year. Ask him how much he saved. This sale lasts 30 days. M. L. SMITH, 112 Flood Bldg., MEADVILLE, PA.

and we ought to use more of it for chicken feed and other animal nutrition. I judge we could use a big part of our exportable surplus in this way and our hen population be the happier and better for it. So, too, wheat replaces corn very satisfactorily as hog feed and a bushel of 60-pound wheat is worth as much or a little more than a bushel of 56-pound corn. Such uses for animal feeding will really accomplish much more than any "eat another slice of bread a day" slogan.

Now I come to what I have been wanting to say. Some pretty prominent men to the contrary, I am absolutely without faith in any such wild scheme as having the Government buy and store, say 200,000,000 bushels of wheat, to "stabilize" the market or any effort to fix a minimum price. Price-fixing, if it is ever justified, can be adopted only as a sort of desperate war-time measure. To me all such schemes seem the summit of folly—chimeras to lead men astray. In the long run, all efforts to artificially fix prices are doomed to failure—surely so if the commodity like wheat is successfully grown over a large part of five continents. Of course, the Government can do wonderful things—for just a little while. If our Government should enter the market as a purchaser of wheat in great quantities it would surely boost prices, but we should merely be holding the bag for the other producers of the world for our surplus would still be on our hands, held by the Nation instead of individuals. Of course, it might help the situation if it could be taken out and sunk in the deep blue sea, but I do not know that the most ardent advocate of governmental assistance has urged any measure as heroic as this. Then, too, under this artificial stimulation, our own product would be bound to increase so that the last end of the experiment would be more disastrous than the first.

As I said at the beginning, these are the days which bring to the surface the radicals, the economic quack-doctors, and the men who have axes to grind. There is a type of politician who prospers in times of public distress and turmoil.

By a great popular majority, Magnus Johnson is elected United States Senator from Minnesota. I do not question his sincerity or personal honesty, but some of his outgivings have the marks of economic lunacy. Yesterday I read the speech of a western Congressman. Either the man is a fool or much worse—a demagogue. I say much worse because in a democracy, the demagogue is infinitely more dangerous than the honest radical. I am absolutely unable to follow some of the loose talk we are hearing these days. The course of history is strewn with the wrecks of economic fallacies and he who runs may read. The call of the times is for agricultural reconstruction—yes—for world reconstruction along the plain, familiar trodden paths, up which through the ages the world has slowly climbed to better things. City and farm—Europe and America—we must all strive together by work, and economy, and righteousness to overcome, so far as possible, the catastrophe of the World War.

NEW JERSEY HORTICULTURISTS ANNOUNCE MEETING

According to H. H. Albertson, secretary of the New Jersey State Horticultural Society, the annual meeting and exhibit of the society will be held in the Haddon Hall Hotel, at Atlantic City, on December 4, 5, 6.

The society is taking an active part this year in cooperating with the New Jersey State Bureau of Markets in the campaign to promote greater consumption of peaches in New Jersey and other nearby States.

EASTERN STATES MILK PRODUCERS TO MEET IN SYRACUSE

A conference of the Eastern States Milk Producers, Inc., will be held in Syracuse on September 12 in the plant of the Onondaga Milk Producers' Co-operative Association. This meeting is a conference of the various independent farm-owned local plants in the eastern territory.

for Economical Transportation OF Farm Products

Transportation is the big problem of today in manufacturing, merchandising and farming.

No matter what you make, grow or stock, it brings no profit until moved to the place of sale.

Modern, progressive farmers, being also business men, now depend on fast economical motor transportation to save time, save products and get the money.

Chevrolet Superior Light Delivery, with four post body was built especially for farm needs. Although not a heavy-duty truck, it has the space and power for a big load, which it moves fast at a very low cost per mile. Its engineering features are modern and complete: powerful motor, electric starter, standard transmission—3 speeds forward and one reverse, demountable rims and extra rim, etc.

For heavy work, Chevrolet Utility Express Truck at only \$575, chassis only, offers remarkable value. Fits any standard truck body.

G. L. F.

G. L. F. Rations manufactured at the Peoria Plant of the American Milling Company are all carefully inspected by a force of chemists in this modern laboratory

L. H. BARNUM
G. L. F. Inspector in Charge

Mr. Barnum was formerly connected with the Dairy Division of the Michigan Agricultural College and is an experienced feeder.

You Are Guaranteed Quality Feeds By G. L. F. Inspection Service

A G. L. F. Inspector is continually checking the quality of each ingredient and the mixing of these ingredients so that those who feed G. L. F. Rations are assured that they not only get the ingredients named, but the exact pounds of each as stated on the tag attached to every bag.

This inspection service at the plants where G. L. F. Rations are mixed is one of the many ways your own cooperative association is helping you get a better feed so you will get more milk at less cost and have better cows left.

If you do not have local service, write

"The Truth in Feeds"

Public Formula Feeds

Among the Farmers of New York

IN a release made during the last week in August, L. J. Steele, manager of the Empire State Potato Growers' Cooperative Association, states that the potato crop will be considerably below that of 1922. According to estimates, the crop of New York, Pennsylvania, and New Jersey will only be 83 per cent of last year. The unusually dry weather has had considerable effect in pulling down the production of the crop this year. It was 10 per cent below last year at planting time. "This looks like satisfactory prices," writes Mr. Steele to the members of the association.

Cabbage will also be somewhat less, according to the same release. A survey of the cabbage situation early in the season indicated increased acreage of 31 per cent above last year's plantings. There was considerable publicity about that dangerous situation which was more or less intended to counteract such a big increase. As it now stands, the acreage of cabbage is slightly reduced rather than increased. This should stabilize the cabbage market materially.

In New York State, the condition of the cabbage is much poorer than it was a year ago. Most of the crop went in late, and dry weather resulted in holding the plants back. In fact, many fields will have to have considerable rain between now and harvest to even yield the crop. Rumor has it, according to Mr. Steele, that several sales of early domestic cabbage for shipping have been made at around \$30 per ton, f.o.b. Indications are that fairly satisfactory prices will be paid for cabbage, and it does not look as if any cabbage of fair quality would have to be fed.

The Wisconsin cabbage crop is in good condition, although below last year's crop. Mr. Steele spent a day in the cabbage section of Wisconsin, and states that the crop there is more advanced and promises a better yield of higher quality cabbage than the New York crop.

NEW YORK COUNTY NOTES

Montgomery Co.—The haying season is over. A large acreage has been left standing for want of help to harvest it. On one farm of a hundred acres in this locality not an acre has been mown. The oat crop is being harvested; most all in by now. The yield is very good. There is also a good crop of buckwheat, and thus far there are good prospects for a large crop. Ensilage corn has made a good growth. The yield of potatoes will be below the average owing to the continued dry weather. Plums and apples are very scarce; not enough for home consumption. Eggs are selling for 35c a dozen; fowls, 20c, live weight; broilers, 25c a pound. There are very few turkeys being raised in this locality. Veals are bringing 11c, live weight; milch cows in good demand, \$75 to \$100 each. No hay is being moved to market. Hay pressers will begin as soon as the grain is harvested. Many farms are for sale, but buyers with money to make the first payment are scarce.—G. P. V.

Saratoga Co.—Buckwheat looks fine; indications are that it will make a good average yield. Corn has made excellent growth, but the extremely cold nights have delayed maturing of the crop. Plum trees are heavily laden, but the fruit will be small. They are bringing at present one dollar a peck. Eggs, 35c a dozen, wholesale; butter, 50c a pound. This year the Saratoga County Fair will be the largest and best in many years. It is expected the attendance will be heavy for farmers are over their heavy work.—E. S. R.

Broome Co.—Our County Fair, which was held last week, was the most successful in its history. Never has the attendance been as heavy. Each day was featured with excellent music, balloon ascensions, and parachute jumping. On three nights of the fair there was a special feature in the nature of a historical pageant. We are still suffering from a terrible dry spell. Springs that have never been known to have gone dry are now going dry. Fruit is going to be scarce.—MRS. E. M. C.

Did You Ever See a Plowing Contest?

(Continued from page 155)

the Syracuse House provided 'a farmers' dinner' for no less than twelve hundred people on the first day—a tempting feast, the records say, which was suitably garnished with moving oratory.

"The second State Fair, held in Albany in the following year, was stretched over three days, and this rule prevailed until 1851, when the Fair assumed the dignity of a four-day session, which remained the practice until after the Civil War period. On the third day the most distinguished spectator, as well as the chief orator, was Governor William H. Seward. Some passages from his address have a special historic interest, in view of what scientific education has done for the farmer in our own day. 'It is a fact,' he said, 'which, however mortifying cannot be too freely confessed, or too often published, that an inferior educa-

Among our early State Fairs, this enjoyed a unique distinction. The official chronicler of the event tells us enthusiastically that 'canal boats and railroad trains poured in their thousands daily, and the manner in which the streets of Rochester were blockaded indicated that every wheeled vehicle within fifty miles of Rochester had, by some magician's wand, been at once congregated in the place.'

Famous Men at the Early Fair

"One can readily believe that Rochester in late September, 1843, was a veritable Mecca for western New York farmers, when its list of honor guests and Fair orators is mentioned. In the group of visiting notables was Daniel Webster, and it also included ex-President Martin Van Buren, ex-Governor Seward, and his successor, Governor Bouck. The presence of this remark-

A reproduction of a woodcut showing a panoramic view of the State Fair grounds at Auburn in 1846

tion is deemed sufficient for those who are destined to the occupation of agriculture.' While admitting that agriculture has been benefited by the invention of the cotton gin, the improved plow, the cultivator, the threshing machine, he still contended that 'while other arts are more rapidly improving, this, of human arts the first and last, whose cultivation leads to plenty, and is cheered by health and contentment, remains comparatively unassisted and stationary.' This idea Governor Seward elaborated with force and eloquence, and the full text of his discourse, which is found in the official reports of the second State Fair, is interesting proof that seventy-five years ago one of the greatest statesmen New York ever produced was a pioneer in the cause of agricultural education.

"Rochester was favored as the location for the third Fair, which was in several respects noteworthy. At Syracuse and Albany admission to the ground had been free; but now the State society ventured on the experiment of charging an entrance fee, 'as a reasonable mode'—so ran the announcement—'of defraying the expenses of the society.' The rate of admission was fixed at 12½ cents. With this departure in view, the Rochester committee had enclosed some ten acres of ground with a high board fence.

able galaxy of big men was in itself a speaking tribute to the growing importance of the new-fledged exposition.

"The speeches at the first Rochester Fair call for more than passing reference. It is a grim commentary upon the melancholy decline of sheep husbandry in this State that John P. Beekman of the State society, in his address, lamented the fact that New York had only 5,500,000 sheep to England's 44,000,000. We can only imagine what he would have said, or thought, if he could have foreseen that seventy-five years later the State would not be able to boast more than one-tenth of the number of native sheep it then possessed. Following Mr. Beekman, ex-President Van Buren referred pleasantly and briefly to his experience with a farm of 136 acres at Kinderhook. But the interest of the Fair crowd naturally centered in the appearance and address of Webster, then at the zenith of his fame. The proper relation of government to agriculture was a part of his theme, and he impressively demonstrated the power of eloquence to vivify and adorn an ordinarily dry subject. Now, when the problem of food distribution has become so acute and pressing, Webster's utterances on this very subject so long ago were remarkable for their wisdom and foresight. 'One great object of government,' said he, 'is to see that the prod-

"The official chronicler of the event (the third Fair, at Rochester) tells us that canal boats and railroad trains poured in their thousands. . . ."

A Simple Problem in Arithmetic

According to an investigation by the University of Illinois on 66 dairy farms, it was found that 133.9 hours per year were required to milk a cow by hand. A De Laval Milker will cut this time in two and save at least 62 hours per cow per year over hand milking, and at 15 cents per hour a saving of \$9.30 per cow per year will be effected, which is equal to 6% of \$155 for just one cow, or \$1550 for ten cows, etc.

This is a very conservative way of figuring the value of the time-saving feature of a De Laval Milker. In actual use it may save a man; or if a man is still retained it may mean that more cows can be kept or that he can devote all his time to other work, the owner looking after the milking himself. Or it may mean that a boy or some other person not capable of doing much milking by hand, with the aid of a De Laval

Milker users, and especially those who weigh their milk and know, do say they get more milk, taking the herd as a whole over a period of a year—some as high as 20%; and 10%, based on the results obtained by many users, seems conservative. Ten per cent of 5000 pounds of milk per year—about the average production per cow per year—is 500 pounds, which at \$2.20 per cwt., the average price of fluid milk in the United States delivered at country stations during 1922, would be \$11.00 per cow per year. Then add this to the value of

the time saved, which is \$9.30, and you will have a total gain of \$20.30 per cow per year, due to the use of a De Laval Milker. Multiply this by 10, 20, 30, or the number of cows you are milking by hand, and you get a very conservative idea of what a De Laval Milker really will make you in profit.

In addition, when it is considered that cleaner milk can be produced, that the drudgery and dislike of hand milking are eliminated, and that dairying is made more pleasant for owner, son or hired man, you have the answer why so many people are installing De Laval Milkers—and especially when it is borne in mind that a De Laval Milker can be bought on such liberal terms and such long time that it will actually pay for itself as it is being used. Full information can be obtained from your De Laval Agent, or by writing us at any of the addresses below.

My Engine
Will Do the
Work of

6

"I set out to build a farm engine that would have every feature the farmer wanted and none he didn't want. It has now been on the market six years. Thousands of satisfied users tell me I've succeeded. I'm proud to have this engine bear my name."

—A. Y. EDWARDS

**EDWARDS
FARM
ENGINE**

Try This Remarkable Engine
FREE

There is no other farm engine like it. Simple in construction and easy to operate. It is only one engine, yet it takes the place of six engines. It will give from 1½ to 6 H. P., yet it is so light that two men can carry it easily. Set it anywhere and put it to work.

Change Power as Needed

It is a 6 H. P. when you need 6, or 1½ H. P. when you need only 1½, or any power in between. Fuel consumption in proportion to power used and remarkably low at all times. Adjustment from one power to another is instantaneous.

Burns Kerosene

Operates with kerosene or gasoline. Easy starting, no cranking. The greatest gas engine

value on the market. And you can prove all of these statements to your own satisfaction.

What Users Say

Ivan L. Blake, of Hannibal, New York, says: "Only engine economical for all jobs. I run a 28-inch cord wood saw, a 24-inch rip saw, a washer, a pump, and a grinder, and it sure runs them fine. It has perfect running balance, and it sets quiet anywhere."

Clarence Rutledge, of Manitoulan Island, Ontario, says: "Have given my Edwards four years' steady work and like it fine. It uses very little fuel. I run a 28-inch cord wood saw, also a rip saw, 8-inch grinder, ensilage cutter, line shaft for shop, churn, washer, separator and pump. Have had ten other engines and the Edwards beats them all."

Frank Foell, of Cologne, New Jersey, says: "It's a great pleasure to own an Edwards engine. I run a wood saw, cement mixer,

threshing machine, etc. Do work for my neighbors. Easy to move around and easy to run. I would not have any other."

**When writing advertisers be sure to say
You saw it in the American Agriculturist**

ucts of the farmer may be easily and speedily transported to the place of sale.' Naturally enough, he voiced the country's admiration of New York enterprise as visible in the comparatively recent construction of the Erie Canal. Nor was the future of New York as a leading agricultural State hidden from his prophetic vision. This passage from his address might have been delivered, with far stronger emphasis, seventy years later: 'New York City has been brought very near your doors. The great emporium of this continent lies close before you. You are rich in your home market—a market of purchase and sale. All New York is at your feet. You can deal with her as if you lived in one of her wards—I mean for all the purposes of commerce.'

The Plowing Contest of 1843

"From the list of attractions of the third State Fair, the eagerly looked-for 'plowing match,' must not be omitted. This enlivening trial of skill in one of the most familiar operations of husbandry took place on the last day, on a farm near the eastern limits of the city, and among the thousands of spectators were Webster, Van Buren, and Seward. Eighteen plowmen entered the competition, the full number the field would accommodate. One-quarter of an acre was allowed to each team, and the time limit was an hour and ten minutes. It was a contest between horses and plowholders, no drivers being permitted. The excellence of the work as well as the time required was to be the test for the award. History is silent as to the identity of the real winner, or winners, in this celebrated competition. It must have been a drawn battle, for the State Fair annalist informs us that 'scarcely two of the spectators could agree as to the individuals to whom the premiums should be awarded.'

The prosperity and the popularity of the Fair continued in spite of the distractions of the Civil War. The exhibits at Rochester in 1862, and at Utica in 1863, drew average attendances. It was following the Utica Fair that the society was about to announce an innovation in the form of permanent buildings. It was described in the records of the society as "an advance toward the style of edification in which agriculture will yet display its annual triumphs."

It was about nine years after the Utica Fair that the society took another step toward a permanent location, when it made an agreement with the Chemung County Board of Supervisors to come to Elmira every three years for a twelve-year period. This agreement was carried out, which accounts for the regularity with which the Fair visited Elmira from 1872 to 1884. However, this contract with Chemung County had hardly expired when public-spirited citizens of Syracuse organized a movement that eventually brought the Fair to its permanent home. In 1887, popular subscriptions and municipal appropriations, aided with the offer of one hundred acres of ground within easy access of the city's business center, brought the famous exposition to Syracuse. The State Fair of 1889 had been promised to Albany. But in 1890, the Fair welcomed its friends to its appointed domicile, and its days of wandering were over.

There is only one other chapter to be added to the eventful history of the New York Agricultural Society's control and management of the Fair, and that is the relinquishing of that control to the State. In spite of the fact that the Fair steadily gained in favor in its new home, it was not a financial success. The failure of the society to make both ends meet, and the rapid accumulation of heavy debts, finally compelled it to resort to the State government for financial aid and relief. In 1900 it became a State institution.

To-day, as we walk across the beautiful grounds, and look upon the magnificent buildings, and admire the exhibits of crops, fruits, livestock, poultry, and machinery almost without number, it is truly remarkable the great progress that has been made in the Empire State.

The records of the old New York State Agricultural Society, from its organization to the present, would make a fair basis upon which to build a history of agriculture of eastern United States.

**It's NATURAL

The Brown Mouse—By Herbert Quick

AS the latest-coming visitors moved forward, they heard the schoolmaster finishing his passage at arms with the salesman.

"You should not feel exasperated at us, Mr. Carmichael," said he in tones of the most complete respect, "for what our figures show. You are unfortunate in the business proposition you offer this community. That is all. Even these children have the facts to prove that the creamery outfit you offer is not worth within two thousand dollars of what you ask for it, and that it is very doubtful if it is the sort of outfit we should need."

"I'll bet you a thousand dollars—" began Carmichael hotly, when Jim waved him down.

"Not with me," said Jim. "Your friend, Mr. Bonner, there, knows what chance there is for you to bet even a thousand cents with me. Besides, we know our facts, in this school. We've been working on them for a long time."

"Bet your life we have!" interpolated Newton Bronson.

"Before we finish," said Jim, "I want to thank you gentlemen for bringing in Mr. Carmichael. We have been reading up on the literature of the creamery promoter, and it is a very fine thing to have one in the flesh with whom to—demonstrate, if Mr. Carmichael will allow me to say so."

Carmichael looked at Bonner, made an expressive motion with his head toward the door, and turned as if to leave.

"Well," said he, "I can do plenty of business with men. If you men want to make the deal I offer you, and I can show you from the statistics I've got at the hotel that it's a special deal just to get started in this part of the State, and carries a thousand dollars of cut in price to you. Let's leave these children and this he schoolma'am and get something done."

"I can't allow you to depart," said Jim more gently than before, "without thanking you for the very excellent talk you gave us on the advantage of the cooperative creamery over the centralizer. We in this school believe in the cooperative creamery, and if we can get rid of you, Mr. Carmichael, without buying your equipment, I think your work here may be productive of good."

"He's off three or four points on the average overrun in the Wisconsin co-ops," said Newton.

"And we thought," said Mary Smith, "that we'd need more cows than he said to keep up a creamery of our own."

"Oh," replied Jim, "but we mustn't expect Mr. Carmichael to know the subject as well as we do, children. He makes a practice of talking mostly to people who know nothing about it—and he talks very well. All in favor of thanking Mr. Carmichael please say 'Aye.'"

THERE was a rousing chorus of "Aye!" in which Mr. Carmichael, followed closely by Mr. Bonner, made his exit. B. B. Hamm went forward and shook Jim's hand slowly and contemplatively.

"James E. Irwin," said he, "you've saved us from being skinned by the smoothest grafter that I ever seen."

"Not I," said Jim, "the school."

"He had a smooth partner, too," said Columbus Brown. Jim looked at Bonner's little boy in one of the front seats and shook his head at Columbus warningly.

"If I hadn't herded 'em in here to ask you a few questions about cooperative creameries," said Mr. Talcott, "we'd have been stuck—they pretty near had our names."

"I'd have gone in for two hundred," said B. B. Hamm.

"May I call a little meeting here for a minute, Jim?" asked Ezra Bronson. "Why, where's he gone?"

"They's some other visitors come in," said a little girl, pulling her apron in embarrassment at the teacher's absence.

Jim had, after what seemed to Jennie an interminable while, seen the county superintendent and her distinguished party, and was now engaged in welcoming them and endeavoring to find them seats—quite impossible at that particular moment.

"Don't mind us, Mr. Irwin," said Doctor Brathwayt. "This is the best thing we've seen on our journeyings. Please go on with the proceedings. That gentleman seems to have in mind the perfectin' of some sort of organization. I'm intensely interested."

"I'd like to call a little meetin' here," said Ezra to the teacher. "Seein' we've busted up your program so far, may we take a little while longer?"

"Certainly," said Jim. "The school will please come to order."

The pupils took their seats, straightened their books and papers, and were at attention. Dr. Brathwayt nodded approvingly as if at the answer to some question in his mind.

"Children," said Mr. Irwin, "you may or may not be interested in what these gentlemen are about to do—but I hope

you are. Those who wish may be members of Mr. Bronson's meeting. Those who do not prefer to do so may take up their regular work."

"Gentlemen," said Mr. Bronson to the remains of Mr. Carmichael's creamery party, "we've been cutting bait in this neighborhood long enough. I'm in favor of fishing now. It would have been the biggest disgrace ever put on this district to have been swindled by that sharper, when the man that could have set us right on the subject was right here working for us, and we never let him have a chance. How many here favor building a cooperative creamery if we get the farmers in with cows enough to make it profitable, and the equipment at the right price?"

Each man held up a hand.

"Here's one of our best farmers not voting," said Mr. Bronson, indicating Raymond Simms. How about you, Raymond?"

"Ah reckon paw'll come in," said Raymond, blushing.

"He will if you say so," said Mr. Bronson.

Raymond's hand went up amid a ripple of applause from the pupils, who seemed glad to have a voter in their ranks.

"Unanimous!" said Mr. Bronson. "It is a vote! Now I'd like to hear a motion to perfect a permanent organization to build a creamery."

"I think we ought to have a secretary first," said Mr. Talcott, "and I nominate Mr. James E. Irwin for the post."

"Quite correct," said Mr. Bronson, "thankie, A. B. I was about to forgit the secretary. Any other nominations? No objections, Mr. Irwin will be declared unanimously elected. Mr. Irwin, will you please assume the duties?"

Jim sat down at the desk and began making notes.

"I think we ought to call this the Anti-Carmichael Protective Association," said Columbus Brown, but Mr. Bronson interrupted him, rather frowningly.

"All in good time, Clumb," said he, "but this is serious work." So admonished, the meeting appointed committees, fixed upon a time for a future meeting, threw a collection of half-dollars on the desk to start a petty cash fund, made the usual joke about putting the secretary under bond, adjourned and dispersed.

"T'S a go this time!" said Newton to Jim.

"I think so," said Jim, "with those men interested. Well, our study of creameries has given a great deal of language work, a good deal of arithmetic, some geography, and finally saved the people from a swindle."

"My mother has a delayed luncheon ready for the party," said Jennie to Jim. "Please come with us—please!"

But Jim demurred. Getting off at this time of day was really out of the question if he was to be ready to show the real work of the school in the afternoon session.

"This has been rather extraordinary," said Jim, "but I am very glad you were here. It shows the utility of the right sort of work in letter-writing, language, geography and arithmetic—in learning things about farming."

"It certainly does," said Doctor Brathwayt. "I wouldn't have missed it under any consideration; but I'm certainly sorry for that creamery shark and his accomplice—to be routed by the Fifth Reader grade in farming!"

The luncheon was rather a wonderful affair—and its success was unqualified after everybody discovered that the majority of those in attendance felt much more at home when calling it dinner. Colonel Woodruff had fought against the regiment of the father of Professor Gray, of Georgia, in at least one engagement, and tentative plans were laid for the meeting of the two old veterans "some Winter in the future."

"What d'ye think of our school?" asked the colonel.

"Well," said Professor Gray, "it's not fair to judge, Colonel, on what must have been rather an extraordinary moment in the school's history. I take it that you don't put on a representation of 'The Knave Unmasked' every morning."

"It was more like a caucus than I've ever seen it, daddy," said Jennie, "and less like a school."

"Don't you think," said Doctor Brathwayt, "that it was less like a school because it was more like life? It was life. If I am not mistaken, history for this community was making in that school-room as we entered."

"You're perfectly right, Doctor," said the colonel. "Columbus Brown and about a dozen others living outside the district are calling Wilbur Smythe in counsel to perfect plans for an election to consolidate a few of these little independent districts, for the express purpose of giving Jim Irwin a plant that he can do something with. Jim's got too big for the district, and so we're going to enlarge the district, and the schoolhouse, and the teaching force, and the means of educational grace generally. That's as sure as can be—after what took place this morning."

"HE'S rather a wonderful person, to be found in such a position," said Professor Gray, "or would be in any region I have visited."

"He's a native product," said the colonel, "but a wonder all the same. He's a Brown Mouse, you know."

"A—a—" Doctor Brathwayt was plainly astonished. And so the colonel was allowed to tell again the story of the Darbshire brown mice, and why he called Jim Irwin one. Doctor Brathwayt said it was an interesting Mendelian explanation of the appearance of such a character as Jim. "And if you are right, Colonel, you'll lose him one of these days. You can't expect to retain a Caesar, a Napoleon, or a Lincoln in a rural school, can you?"

"I don't know about that," said the colonel. "The great opportunity for such a Brown Mouse may be in this very school, right now. He'd have as big an army right here as Socrates ever had. The Brown Mouse is the only judge of his own proper place."

"I think," said Mrs. Brathwayt, as they motored back to the school, "that your country schoolmaster is rather terrible. The way he crushed that Mr. Carmichael was positively merciless. Did he know how cruel he was?"

"I think not," said Jennie. "It was the truth that crushed Mr. Carmichael."

"But that vote of thanks," said Mrs. Brathwayt. "Surely that was the bitterest irony."

"I wonder if it was," said Jennie. "No, I am sure it wasn't. He wanted to leave the children thinking as well as possible of their victim, and especially of Mr. Bonner; and there was really something in Mr. Carmichael's talk which could be praised. I have known Jim Irwin since we were both children, and I feel sure that if he had had any idea that his treatment of this man had been unnecessarily cruel, it would have given him a lot of pain."

"My dear," said Mrs. Brathwayt, "I think you are to be congratulated for

A Successful Theater

Suffolk County Introduces One at the Fair

LAST year, for the first time, the Little Theater found its way into the Fairgrounds of Suffolk County. Fostered by a few practical idealists, and with the aid of some young women who had been studying drama, the small tent found a snug place in the midst of the noisy thoroughfare and the crowded booths.

For those who undertook the project, it was an anxious few weeks before fair time. Would the people support it? Did they wish something more than fortune-tellers and fakirs, baseball, horse races and vaudeville? And how could the Little Theater be brought to the notice of the fair crowds, and be made to appeal?

There were no professionals to do the acting, training or planning; just ordinary people who loved the work and applied common sense to the problems that arose. And so well did they succeed that every day saw throngs waiting for the next play to go on—a sufficient evidence that there is a real demand for worth-while entertainment. This year, those of us who are undertaking the work hope for even greater success, since we have some experience to build upon.

Perhaps some American Agriculturist readers are contemplating the opening of a Little Theater and would like to know how a small group should go about it. The ideal arrangement for the County Fair is to have each town present three one-act plays, each play not lasting longer than one hour, including music. Here the plays are advertised to go on at 1:30, 3:00, and 4:30 in the afternoon. The mornings, of course, are spent assembling the various properties and acquainting the players with the facilities, which, in a tent, occasionally call for a little imagination.

This is our ideal, but we do not dictate too strenuously to the various towns, as to the length of their plays. Some groups prefer to give two rather longer plays and some may even have one pretentious one, in which cases we must change the hours of the performances and the admission charged. We do insist that the group shall represent a community, or a society to which all members of a community are eligible, for it is community talent that we are encouraging, not that of any one faction or creed. We try especially to interest young people of high school or college age, and are glad to welcome any club or society engaged in civic work.

The Movement is Destined to Grow

The Little Theater is, of course, not primarily a money-making scheme. It purposes to create interest in artistic expression, to develop poise and self-confidence, to give our young people a practical knowledge and an appreciation of the elements that make up good drama and to raise the standard of amateur plays. When the Little Theater finds a place in the County Fair, there comes immediately the stimulus of competition. Thus far, we have made no comparison of the plays given nor have we awarded prizes. But I believe that if all over the State, neighboring counties could be grouped, the best play from each county repeated in an inter-county contest, and then the winners of the county contests compete at the State Fair, a more organized and uniform development and a more widespread interest would come to the whole Little Theater movement.

Although it was not for money that we undertook the work, our Little Theater did much more than meet expenses the first year, and we feel confident that this year it will really pay well. Our manager, that energetic soul whose business it is to make all arrangements, background, curtains, about tent or building, stage, seating arrangements, general advertising, and all the properties that the different towns require, receives one-fifth of the gross receipts. From these receipts, too, each town is allowed \$10 for music, and if any town wishes extra music, it pays the excess out of its share of the net proceeds. The general expenses involved in carpentering, labor, hiring piano, or for any other necessity that

all use, comes likewise out of the gross receipts. Each town, however, pays for its own dodgers for the day (we find it a good scheme to have the program printed on them), and each one assumes responsibility for drawing attention to its attraction, and does its utmost to make its own day a success. When all the general expenses are paid, the towns taking part (in Suffolk there are five Fair days and so five towns) share the remainder equally, regardless of the amount they took in. This is an equitable division, since some days favor a larger attendance than others.

To the press and officials of the County Fair, we owe much for their unflinching courtesy and cooperation. The county papers have never failed to print everything we have sent them, and have thus freely given us the publicity so essential to success. The Fair authorities have granted us every facility at their command, although we pay no concession. We believe that the papers and the Fair officials of any other county would be just as willing to do all in their power to encourage and foster the talents of their citizens and to add to their enjoyment.—
BELLE C. L. PIKE.

OIL LIGHT BEATS ELECTRIC OR GAS

BURNS 94% AIR

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal oil).

The inventor, R. M. Johnson, 642 N. Broad St., Philadelphia, is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him to-day for full particulars. Also ask him to explain how you can get the agency, and without experience or money make \$250 to \$500 per month.

Keep Your Baby Outdoors

Children, Like Plants, Thrive Best in the Air

"THE children who get the most fresh air," said a well-known child specialist, "are not the children who live on farms, but those who dwell in city apartment houses. Doctors seem to have thoroughly impressed on city mothers the fact that babies, like plants, thrive best outdoors. Perhaps to people who live on a farm, fresh air is so accessible that it is not valued."

Probably it is true that the things we have with us every day are apt to be underappreciated. A farmer's wife may sometimes be "fed-up" on fresh air. She may almost feel that she is cherishing her infant when she wraps him up in a pretty quilt, and allows him to sleep near the big stove in the kitchen instead of putting him out to brave those elements which he will have to meet later in life.

But if a city mother allows her home to remain unswept and undusted while she wheels her child out in the park, should not a country mother utilize the grounds or porch of her home? Should she not let her baby live out-doors, when she can so conveniently do so? Fresh air and sunshine are Nature's sovereign tonics. A child may remain outdoors from about ten in the morning until four or five o'clock during winter months. In the spring and summer, these hours of course may be lengthened, the only care being to see that the child is not exposed under too hot a sun.

Don't Fear Rain or Snow

An infant is not harmed by sleeping in his carriage during rain, provided it does not fall directly upon him. He may also remain outdoors through days of melting snow.

Of course he should be well protected, both by quilts wrapped directly around his little body, and by blankets used as covers. A little coat made of a soft woolen blanket is a practical thing for winter. Do not make a bag, because this deprives baby of the use of his arms. When he wakes up, he will sometimes lie for over an hour, working his little arms around and examining his hands with the utmost interest.

It is not advisable to protect a young child's ears too carefully. The ears through over-tending become tender as hothouse plants and wilt from cold that otherwise would not have harmed them. Remember that a human being, even a young human, is an adaptable animal, and that his body, as well as his mind, rises to reasonable demands made upon its vigor.—MRS. SARA OWEN.

MAKE BOYS' CAPS AT HOME

If there are several small boys in your family it will pay you to make some of their hats and caps. It is really quite easy once you get your pattern, that being the most difficult, but by patiently making one from a used cap or hat you can proceed.

Use the back of a pad for stiffening for visor, and heavy muslin for interlining for brim of the rah-rah or middy hats. As for material, you will surely have some on hand or some garment past usefulness. The wrong side is suitable and your piece box will probably provide lining. I am inclined to think if material had to be bought it would pay. Buy Indian head or duck for the white middy hats and note the saving.—PATSY'S WIFE.

NEW DRESSES AND BLOUSES FOR AUTUMN WEAR

No. 1824 is the slip-over style of blouse, easy to make and smart. It is all in one piece and slashed at the waistline for the snug-fitting hip band. No. 1824 comes in sizes 16 years, 36, 38, 40, 42 and 44 inches bust measure. Size 36 takes 2 1/2 yards material. Price 12c.

UNDER the new dresses, the costume slip is almost imperative. No. 1864 shows the correct new style. It has a camisole top and a long waistline. No. 1864 cuts in sizes 16 years, 36, 38, 40, 42 and 44 inches bust measure. Size 36 takes 2 1/2 yards material. Price 12c. Pattern No. 674 for embroidery, 12c. extra.

No. 1714 is the new jacquette blouse being shown by all the stylish Fifth Avenue shops. The pattern provides for long or short sleeves. No. 1714 comes in sizes 16 years, 36, 38, 40 and 44 inches bust measure. Size 36 takes 2 1/2 yards 36-inch material, 1/2 yard contrasting. Price 12c.

No. 1804, simple beyond words to make, deceives the eye by seaming a very dressy little frock. Made of novelty silk, it suits the young girl or more mature women. No. 1804 comes in sizes 16 years, 36, 38, 40, 42 and 44 inches bust measure. Size 36 takes 2 1/2 yards 36-inch material. Price 12c.

No. 1882 is a slip-on "diagram dress." The short kimono sleeves may be lengthened. Two pleats are laid in on each side of the seams below waistline. No. 1882 cuts in sizes 16 years, 36, 38, 40, 42 and 44 inches bust measure. Size 36 takes 3 1/4 yards 40-inch material. Price 12c.

To Order—Write name, address, pattern numbers, and sizes plainly; enclose 12c for each pattern and send to Fashion Department, American Agriculturist, 461 Fourth Avenue, New York City.

Of course you want our Fall and Winter Fashion Magazine. Add 10c for your copy.

POTATO MARKET WEAK

HERSCHEL H. JONES

FROM the high point, \$4.50 per 150-lb. sack f.o.b. loading station, Long Island potatoes within a few days last week worked down rapidly to \$3.75. The weather, except for a few showers, has been favorable for digging and the growers have been too active for the trade. Furthermore, the stock is green and must be handled quickly from the fields to the consumer. The prices to the grower have dropped from \$1.60 to \$1.30 per bu.

Some large dealers have instructed their agents to refuse to buy until the price goes to \$1.20 bu.

North Jersey round stock dropped to \$3.40 per 150-lb. sack loading point; giants touched \$2.25.

Long Islands in New York City wholesale markets sold around \$5 per 180 lbs. bulk; \$4@4.25 150-lb. sack; Jersey rounds, \$3.50@3.75. Buyers were holding off.

ONION SHIPMENTS INCREASING

The last weekly summary of carlot shipments from the United States Department of Agriculture shows 224 cars of onions shipped from New York State with a total of 411 carloads this season up to August 25. California and Washington are the only States that have exceeded New York in shipments of onions so far this year with Iowa and Massachusetts closely following. Shipments so far from New York State have been nearly double what they were up to the same time last year. The market for onions in New York has been dull and the demand only moderate. Receipts were light, especially from Orange County. The following wholesale prices were quoted on onions August 30: Per 100-lb. sack, Red, best, \$2.25@2.50; Yellow, best, \$2.60@2.65; Yellow, best, \$3@3.25; up-State, Yellow, best, \$3.50@3.60.

CABBAGE SUPPLIES LIMITED

Supplies of cabbage from up-State sections were very limited in the New York market last week and the market was steady for fancy green stock, which sold per ton, bulk, at \$45@50 for best Copenhagen, and \$40 for ordinary stock.

HAY MARKET FIRM

There was an active demand for hay last week and a firm market. Good hay sold very readily. The new hay is of excellent quality and sells at same prices as old. No. 1 Timothy averaged about \$30 per ton with \$31 as top. No. 3 went as high as \$27.

FLOOD OF SOUTHERN APPLES

Liberal receipts of basket apples from Virginia and other States caused a weak market in spite of comparatively small shipments from New York State sections. The demand was very limited except for fancy large size, well-colored stock, particularly Greenings. Wholesale prices August 30 were as follows: Per bushel basket, WEALTHY, best, \$1.25@1.50; ordi-

nary, 75c@\$1. GRAVENSTEIN, best, \$1.25@1.50; ordinary, 75c@\$1. MAIDEN BLUSH, best, \$1.25@1.50; ordinary, 75c@\$1. ALEXANDER and WOLF RIVER, best, \$1.25@1.50; fancy, \$1.75; ordinary, 75c@\$1. DUCHESS, A grade, 2 1/4"-2 1/2", 85c@\$1 in barrels, A grade, 2 1/2", \$2@4. The demand for crab apples was very light and the market steady only for fancy well colored, and small size fruit, of which best sold at \$3@3.50, with a few small sales of extra fancy at \$4. Large crab apples, best, \$1.50@2; ordinary, \$1.

A few peaches from Hudson River Valley sections were offered in the market. There was practically no demand, due to very small size and ordinary quality.

Demand was limited for all varieties of pears except fancy large size, well-colored stock. Most of the shipments from nearby sections were Bartlett's, which sold at \$2.50@2.75 per bu. basket for best, with some sales up as high as \$3.25 for fancy large and as low as \$1.50 for small and ordinary. CLAPP'S FAVORITE, best, \$2.75 bu. basket. FLEMISH BEAUTY, \$1.25@1.50. SECKLE, best, \$2.50@2.75.

DEFECTIVE EGGS MOVE SLOWLY

Nearby eggs of defective quality moved slowly last week. Either browns or whites showing results of heat or of being held before shipment, were hard to move, even at comparatively low prices. Some of these would not bring over 30c dozen, although the general quotation on undergrades was 32@38c.

Fancy nearby whites, however, were in light supply and the market firm. The top quotation on New Jersey henry whites, closely selected extras, continued at 55@57c; other nearby henry whites, average extras, were quoted at 48@51c. Values of nearbys show a wide range. Many dealers are now using high-grade cold storage eggs instead of fresh, and apparently a lot of cold storage eggs are coming into the market as fresh. The receipts of western eggs have been liberal. The movement of eggs to the four large markets of the country was greater in August this year than in 1922. The total stocks of eggs on hand at New York are about 28,947 cases in excess of last year. The average weekly output at New York in August, 1923, was 130,000 cases, compared with 127,500 in August, 1922.

POULTRY MARKET UNSETTLED

Because of the unexpected heavy influx of live poultry, the market became very unsettled toward the latter part of last week. A strike of poultry killers in Harlem and the Bronx, added much in making trading conditions even

worse in these two boroughs, which consume approximately 40 per cent of the supply.

The value of express receipts of live poultry was very uncertain, and, although some sales were made even higher than quotations in the early part of the week, it was difficult to realize top quotations toward the close of last week. Wholesale prices on August 30 were as follows: Fowls, colored 25@30c; Broilers, colored 30@31c; Leghorn, large 29@30c, average 27@28c, small 23@26c.

FANCY DRESSED VEALS SCARCE

Strictly choice veals were very scarce last week and although buyers were not willing to pay high prices at the beginning of the week, they paid from 20@21c per pound for choice veals on August 30. Most of the stock on the market, however, was not good enough to command over 18@19c and lower qualities ranged even lower.

The live calf market remained practically unchanged although receipts were light. The demand was dull and \$15 was the top quotation for the finest veals.

The market for sheep and lambs was firm and steady. On August 30, medium to prime lambs sold at \$14@15 and most of the sheep went at \$4@6. The light receipts of live hogs found a higher and firm market, with medium bringing from \$10@10.20 per cwt.

CHEESE MARKET QUIETER

Trading on cheese has been quieter since the advances reported here last week. Average run New York State flats and Wisconsin daisies moved more slowly and the market tended toward weakness. Distributors felt that prices were too high and many held off buying. Average run whole milk State flats, fresh, were quoted at 25 1/4@25 1/2 a lb. August 30: Fancy fresh flats 26@26 1/2c.

Fancy large eyed domestic Swiss cheese brought 38@41c; Green County block from 31@35c. Imported Swiss was quiet and steady at 47c wholesale.

New York State Limburger cheese is bringing wholesale, 2-lb. size 26c, 1-lb. size 27c. Dealers say prohibition has materially reduced the consumption of Limburger.

Quotations on other kinds of cheese will be furnished on request.

BUTTER MARKET STEADY

Receipts of butter were somewhat heavier last week at New York and the quality much improved. Buying was not very free and some houses had a surplus. The market continued steady, however, and the tendency was toward maintaining the present price level. Creamery extras (92 score) were quoted August 30 at 44 1/2@45c

Quotations From Eastern Markets

The following are the prices at which farm products of special interest to eastern farmers sold on August 31:

Eggs, Nearbys (cents per dozen)	New York	Buffalo	Phila.

Milk to Start the Layers

IF you want to start your pullets to laying, give them plenty of milk. No stock on the farm will pay a better profit for the milk they get than the hens. I have known several instances where flocks have responded promptly to a milk diet.

Milk can be fed sweet or sour. My favorite way is to heat it just enough to separate the whey and then feed the soft curds. There is less waste this way, as they can pick up the curd, even if it is scattered on the grass. Feeding troughs, made by two six-inch boards nailed V-shape, serve better than anything else I have tried. Nail two six-inch boards a foot long on the ends so the top edges are even and the trough will not upset and will be held up a little so it rests firmly on the ends. If you want it higher, you can use wider ends.

I have mixed mashes with milk, too, and if the milk is clabbered, and the mash is mixed so thick it is crumbly, this is an ideal feed, so relished that the hens will eat very liberally. Ground grains of any kind will answer, for the mashes or bran is excellent, but unless milk is fed very freely I would not feed meal or corn in any form except at night. Milk makes whites for the eggs, and more of the corn goes to yolks than any other grain, though all grains furnish more than a proportion of yolks, which explains why milk helps egg laying so much. Any surplus yolk material not used for yolks is stored on the body as fat. If you have pullets too fat, cut down on the grain and increase the milk and they will lay off some of their fat.—L. H. COBB.

SELL CLEAN EGGS

I often wonder if farmers really know what loss they sustain from dirty eggs. From actual records it has been computed that the average loss is four cents per dozen on dirties. This, in a large measure, is due to carelessness on the part of the farmer. Formerly the farmer washed his eggs, but the market has come to discriminate against washed eggs, since their keeping qualities are impaired. The natural bloom which is on the eggs when they are laid is removed by washing and the pores are opened, thus hastening evaporation. Generally, the poultryman markets his dirty eggs now without washing.

Dirty eggs occur in larger volume in the spring and fall when the hens carry in mud to the laying house. These are unavoidable to some extent. However, if plenty of clean nests are provided for the flock, the number of eggs laid on the ground and on the floor of the pen will be reduced. One nest for six hens will be sufficient. Change the nesting material often enough so that it is loose and not matted together with broken eggs and filth.

Keep broody hens confined. They break eggs and disturb the nests. During the spring and early summer the broody hens monopolize the nests. They destroy the eggs laid there and prevent the layers from entering the nests. The number of floor eggs is increased appreciably. Broody hens should be confined and broken up as soon as possible.—A. H. PULVER.

The Brown Mouse

(Continued from page 163)

having known for a long time a genius."

"Thank you," said Jennie. And Mrs. Brathwayt gave her a glance which brought to her cheek another blush; but of a different sort from the one provoked by the uproar in the Woodruff school.

There could be no doubt now that Jim was thoroughly wonderful—nor that she, the county superintendent, was quite as thoroughly a little fool. She to be put in authority over him! It was too absurd for laughter. Fortunately, she hadn't hindered him much—but who was to be thanked for that? Was it owing to any wisdom of hers? Well, she had decided in his favor, in those first proceedings to revoke his certificate. Perhaps that was as good a thing to remember as was to be found in the record.

(Concluded next week)

WOLVERINE

The 1,000-Mile Shoe

Double-Tanned—Double Wear

Nov. 6, 1922
Amity, R. D. 2, Penna.
Michigan Shoemakers:
Dear Sirs—I have been so well pleased with your shoes that I wish you would send me your catalogues. I have secured for you another purchaser in my father. He said that shoes that would stand the rough usage that I give them were well worth your reasonable price. I must say that they are the most comfortable I have ever worn, and stand the wear better than any shoe I ever wore, bar none. You may publish parts or all of this letter.
Yours truly,
WM. HERRMANN
P.S. A neighbor young man is wearing his third pair of shoes since I got my Wolverines and I think his next pair will be Wolverines.

The Plowboy

Get this shoe for fall plowing. It's high enough to keep out dirt. Fits snug and protects the ankles over rough going. And it's low enough for comfort.

Ask for
Plowboy

1,000 Miles of Wear

Always Dries Out Soft

Here's a double-tanned horsehide work shoe that will never get stiff or hard. Many leathers dry out hard after they get wet. But this horsehide, double-tanned by our own private process in our own tanneries, dries out as soft as velvet. You can soak these shoes in mud, water and slush. They will always dry out soft and pliable.

We are work shoe specialists. Our goal is to make the world's strongest shoes. To get the best leather we do our own tanning. We use horsehide exclusively. For it is the toughest leather known. For centuries the fine saddles of the hard-riding Cossacks were horsehide covered. Big league baseballs are covered with it too—because it is the only leather that withstands such hard knocks.

And our special double tanning makes this leather soft and pliable as buckskin. Note its extra thickness. Feel its flexibility. Even after soaking it dries out soft as velvet. You'll

get a new idea of foot comfort from Wolverine horsehide shoes.

You'll also be surprised by their long wear. They usually wear at least 1,000 miles. But customers tell us they wear 3,000 and 4,000 or more. We are frequently told they outwear three ordinary pairs.

If you are naturally hard on shoes, you'll say these are the most economical shoes you ever wore. See how tough and thick this horsehide is—and how soft. Then you'll understand why Wolverines wear like iron and do not tire your feet.

For every job there's a special Wolverine shoe model that fits

your need exactly. For farm, mill or mine, for woods, field and camp we make a shoe that suits the conditions. And all are the same tough, pliable double-tanned horsehide.

If your dealer cannot supply you with Wolverines, we'll see that you are supplied from our nearest dealer. Write for catalog

Wolverine Comfort Shoe

Tender feet welcome these shoes. They're soft and flexible as a moccasin, yet wear like iron. And so light and easy, you'll never know they're on duty. For tender feet, or where you do not encounter wet weather, wear this comfort shoe.

The Modern Woman Writes the Modern Way

MOTHER is just as up-to-date as the rest of her family! When it comes to sending to the city for things her family needs she types her order quickly and clearly on the Underwood Portable, and her goods come through with never a mistake. She's sure of this, because she checks the goods against the carbon copy of her order.

The Underwood Portable saves time and work on all the writing done at home,—business and personal letters, recipes, extracts from

magazines, and orders for supplies from far away.

Young people at school who form the habit of typewriting lessons, essays, etc., are bound to win favorable attention from their instructors. What is more, in acquiring a knowledge of typewriting they have gained something that will be valuable to them for many years to come.

It is easy—in fact it's fun—to write on this compact, sturdy little typewriter. Typewriting is quickly learned on this machine—a few hours will make anyone reasonably proficient.

PUBLISHED WEEKLY

*Wasn't it pleasant, O brother mine,
In those old days of the lost sunshine
Of youth—when the Saturday's chores were through,
And the "Sunday's wood" in the kitchen, too,
And we went visiting, "me and you,"
Out to Old Aunt Mary's?*

*We cross the pasture, and through the wood
Where the old gray snag of the poplar stood,
Where the hammering red-heads hopped awry,
And the buzzard "raised" in the clearing sky,
And lolled and circled as we went by,
Out to Old Aunt Mary's.*

*The jelly—the jam and the marmalade,
And the cherry and the quince "preserves" she made!
And the sweet-sour pickles of peach and pear,
With cinnamon in 'em and all things rare!—
And the more we ate was the more to spare,
Out to Old Aunt Mary's.*

Nature Abhors a Vacancy

Either in the Mind or in the Orchard—Empty Spaces Cost Money

THE other day I was walking through a large bearing-apple orchard roughly appraising it upon the order of an interested third party. The asked price was \$65,000 for the fifty-some acres, which price included the buildings and equipment and some extra land.

And while my appraisal was something under \$40,000 for the whole, I had to acknowledge that there was quite a generous percentage of these apple trees richly worth \$1,000 per acre, being just coming into prime age, and of the best market varieties. The balance of the acreage was younger, by various stages, down to some ten acres, but three or four years set.

But I also had to acknowledge one severely adverse feature—the determining of which cost me two-thirds of my day; the parts worth \$1,000 per acre averaged slightly under twenty-two trees per acre notwithstanding they were laid out thirty-six feet apart each way, or thirty trees per acre (allowing for aisles) this twenty-seven per cent waste space representing vacancies—past which the expensive spraying machinery had to be hauled and over which all tillage tools passed—in vain, a dead loss at exactly the point, where every commercial orchardist looks for his net income plus a bit of velvet on successful years.

Instantly I saw where lay the cause of this orchard being for sale and why its hard-working and otherwise efficient owner had put in half a lifetime without once really getting ahead of the game. All these years he had been putting in good money on those empty spaces—all but the harvesting labor for what, on a baseball score, would be marked by "goose eggs"—no runs! No honest business man can long stand up under 25 per cent annual losses, and mighty few under five per cent!

Still wondering and astonished, further questioning upon the cause brought out the fact that, the first ten to fifteen years, these bearing acres had carried a nearly 100 per cent stand of trees. Then the owner dug out those now gone because they had proved, as they came into bearing, not true to name and generally valueless. He had never become fore-handed enough to afford the five to ten dollars per tree expense of top-working these by regrafting, but instead had solved the problem in this fatal way.

By DAVID STONE KELSEY

If the above were an isolated case or even unusual it would not be so serious: but it is a fact that many farm orchards contain just as many holes—not only twenty-five, but even fifty per cent waste space; and equally often, and worse, waste trees are filling those spaces which should be filled with profitable bearing trees. It is true this man made a mistake in not top-grafting, but his original mistake was in his choice of a nurseryman,

ries and recommends, but upon his methods of preventing mistakes, and above all the sources of his scions and stock buds. Preferably we buy of a nurseryman who is himself an orchardist. A practical, successful fruit grower very rarely sells poor grade nursery stock, and I have never known one to sell spurious stock. They are not only honest, but heroic, consigning many wagon loads of tolerably saleable trees to the brush pile during the spring season of each year.

And second, other things being equal, we buy of the nearest nurseryman—very rarely going out of the county where our trees are to be set. Even a somewhat crafty or unscrupulous nurseryman will hesitate to sell poor or unwarranted trees to an acquaintance or man from a neighboring town. He will not even advise him to set "big" trees just because he himself wishes to sell these.

On the other hand, the honest nurseryman will not be beaten down from his price, and it is only the most foolish or inexperienced planter who will attempt it. He had far better smilingly pay full rates, but maintaining firmly his demand for the very highest quality and guarantees.

Would you feel safe in calling a man thoroughgoing in his business methods who

felt pleased at saving, let us say, fifteen cents on a nursery tree, knowing that tree would in a few years be richly worth forty dollars if good and nothing if bad? Yet such is human nature. The average man seems delighted to save at the spigot and lose at the bung-hole almost any time.

I know of nothing more unsatisfactory than the fruit nursery business as it has been the last eight years. About the only money most nurseryman have made has been in shade trees, shrubs and other plants. Some also have made money with small fruits, but all have lost on tree fruits, even though the price has seemed exorbitant.

In our market-gardening we often pay, let us say for cucumber seed, fifteen dollars a pound, while our competitors are buying for one dollar and ten cents; but in the marketing season that extra ten dollars per acre brings us probably not less than one hundred dollars more than we would have received from the use of the cheaper seed. Similarly, wouldn't it pay to lay out an extra five or ten dollars per acre to buy only

(Continued on page 176)

"Vacancies, past which the expensive spray machinery had to be hauled, and over which tillage tools in vain—a dead loss—." In the orchard here pictured, the grower appreciates "the dead loss of vacancies" and has set a young tree, which in a few years, will fill the void

and this article is intended as a warning on that point, which is especially timely just now. There has been a comparative dearth of new orchards planted during and since the Great War. Prices on good nursery stock are still high, but it is certain that as returning prosperity comes, many of our Eastern States farmers will soon be buying again and planting on a large scale. At this very moment there is a barrel of money being made by the more thorough-going Eastern orchardists. I said thorough-going with greatest reason, for these men began with thoroughness—in the selection of their nursery stock and their nurseryman.

First "Catch Your Rabbit"

There is an old English recipe book which begins its direction for making a rabbit pie with these words: "First catch your rabbit," and similarly the intending orchardist should first visit and get acquainted with his nurseryman. Never buy nursery stock until you have looked its grower in the eye, walked over his plantation, and questioned him carefully, not merely about the varieties he car-

No. 11

The Rural School Bill

BEGINNING with next week's issue, American Agriculturist will run a series of articles and letters about the recommendations of the Committee of Twenty-one, for rural school improvement. It will be remembered that these recommendations were incorporated in the Rural School Bill which was before the New York State Legislature last year. The bill passed the Senate and was laid over in the Assembly.

Not in many years has there been a more important issue before the New York State farmers than the principles in this Rural School Bill, and never in our experience has there been a proposed law vitally affecting the interests of farm people that has been more unfairly attacked, misrepresented, and misinterpreted. It is a very easy thing for selfish demagogues to get temporary popularity, resulting in material gains to themselves and their business, by misrepresentation and abuse of people and principles.

And that is just what has happened to the Committee of Twenty-one and their recommendations for school betterment. Enemies have gone so far as to appear in public print with statements that leave the impression with farm people that the Committee of Twenty-one had \$75,000 which they used to their own advantage! Just where this money came from and how it was spent will be fully explained in later articles. Sufficient to say now that the accounts are open to anybody's inspection, they were audited by a public accountant, and not a cent was spent except under the rules of the State of New York, requiring sworn affidavits. Perhaps it is unnecessary to add that with the exception of two members of the committee—a farmer who left his own work at home and worked a few days to help get people out to meetings, and another member who helped with the survey—no one on the committee received any compensation from this fund. On the other hand, there is not a person on the committee who has not sacrificed much of his own time and work in an effort to do something for country children.

We mention this particular attack upon the motives of the committee as one illustration of the kind of campaign that has been waged. In addition to the few but powerful demagogues making a selfish issue of the bill, there have been many persons who have been perfectly sincere in opposing the bill and its principles as they understood them. About this kind of sincere and honorable opposition, we have nothing to say, for it is a good thing for any proposition to have honest criticism in order to bring out all sides. Much of this criticism has arisen from a misunderstanding of the recommendations in the School Bill and will cease after more study of what is proposed.

When the farm people of New York State find that the proposed school bill will maintain a majority of the one-room schools at actually less taxes than they are paying now, those who have spent months misinforming the public about these suggestions for school betterment for selfish reasons may be in line for a boomerang. The bill provides for equalization of the tax rate which will result in ten million dollars more State aid for the country schools. Of this ten million dollars of State tax, New York City alone pays approximately 67 per cent, and the other cities of the State bring the total to approximately 87 per cent. If you live in a rich district with high valuation, the equalization provision in the bill will tend to raise your tax by dividing the burden more equitably with poorer districts that are not so fortunately situated. These outlying poorer one-room school districts are in the majority in the State; therefore, we make our statement that the majority of farm people will actually have their school taxes lowered. But even those who live in wealthy districts need have no fear of greatly increased taxes, because the bill provides so much more direct help from the State. A full explanation with examples of just how this works will appear in an early number of this paper.

Another provision in the bill which has been much misrepresented is that of consolidation. This provision of the bill also will be explained in detail in the coming articles, but we want to say here that all this talk about the difficulties of transporting children by truck over wintry roads has no point as far as this bill is concerned, because under the proposed law, under no consideration would it be possible to consolidate any district or districts without a majority vote in every district affected. The committee fully recognize that there are districts so situated because of weather and roads, that they should never be consolidated with any other; it is recognized that there are other districts where consolidation might help. The only ones who are in a position to judge are the people most affected—those who live in the districts, and who will by their vote decide the issue.

Under the bill also there are provisions for more local control by the patrons of their schools than they now have. All of these will be explained.

During the past spring and summer, American Agriculturist has not had much to say on this important subject because we thought that people were too busy with the farm affairs to give it proper time for reading and study. With the opening of the new school year and with the longer evenings, farmers will now have more interest in matters of this kind, and will do more reading.

As far as American Agriculturist is concerned, from a selfish standpoint, we would do better to say nothing about it, for there has been so much misinformation put out about the bill that there is a lot of bitterness. But in spite of this, since we believe in it, we will do our best to make the principles of the suggested law clear. For the sake of the boys and girls, we know that our

thousands of people will give these coming articles a fair reading. After you have done this, we are perfectly willing to leave the decision entirely to you.

The Coal Strike

SEVERAL times this summer we have suggested to our people that they be sure to get their coal into their cellars, for we were afraid that unless you bought coal early you would be unable to get it at all. At this writing, miners are out once more on strike, and the coal situation therefore promises to be very serious again this winter. The issues involved between the miners and the operators are so confusing and so much is said on one side that does not agree with what is said on the other that it is very difficult for anyone to draw any conclusions as to who is right and who is wrong in the controversy. In either case, the public—the innocent bystanders—will be one of the chief sufferers.

Without question there are many injustices on both sides and there is altogether too much radicalism and unwillingness to compromise on the part of the workers. But the mine owners are chiefly to blame for this because they would not give the workers a square deal until they had to. The miners are obliged to use force and force always goes too far. Farmers have a parallel case with the milk dealers. There are now a good many of the milk dealers who are doing square business, but before the dairymen were organized, every farmer knows how unfair nearly every dealer was.

The Japan Cataclysm

ASERIES of terrific earthquakes in Japan on September 1, 2 and 3, followed by great fires and tidal waves, caused probably what is the worst catastrophe in the world's history. Accurate figures are not available at this writing, but newspapers report that from 150,000 to 200,000 people were killed, among whom were many of Japan's leading business men and statesmen, and many prominent foreigners, including Americans. An innumerable list have been wounded, thousands more are dying from exposure and starvation because of the destruction of their homes and food supplies and the difficulty of getting relief quickly into the devastated regions. Property damage will run into billions of dollars. Whole sections of the cities of Tokio and Yokohama have not a standing building left. Other and smaller cities have been nearly or quite completely destroyed. Several islands in the Empire sank in the sea and new ones rose from the water. Rivers changed their courses, one of them right through the city of Tokio. This river was clogged with dead, as were many of the streets. Truly the "Land of Cherry Blossoms" has become a land of horror.

All the world is reaching out a sympathetic and helping hand to the stricken people. President Coolidge issued a proclamation asking the people of America to raise a large sum which the Red Cross can use in immediate help to the Japanese. Should you wish to contribute, send any amount you desire to the Director of the Red Cross, city of Washington. A small gift may save a life.

Earthquakes are supposed to be caused by the comparatively thin earth crust adjusting itself over the subterranean fires. The crust is thinner in some parts of the world like the Far East where there are frequent earthquakes, than in others like Eastern America where an earth tremor is seldom felt. The theory is that the water of the ocean soaks through the thin crust into the great fires underneath and the mighty conflict between fire and water upsets the earth's surface over thousands of square miles. Another theory is that the crust must readjust itself as it contracts when it cools.

Hens Can Pay Dividends By Sitting

But Other Critters Have to Hustle—How Education Helps

By W. A. FLANAGAN

UPON being given the opportunity of speaking with an audience which is all interested in the same work, I have chosen for my talk a question with which we as agriculturalists should all be concerned, and though old, one which I believe is still both acute and urgent: "Is an agricultural college worth while?" Perhaps to some of you this topic is quite ambiguous, and to the rest it is already an answered query, but be that as it may, allow me to introduce a part of a conversation which moved me to speak along such a line. I was applying for work on a farm last summer and had been talking with the farmer when he exclaimed, "Oh! So you're one of these college fellows, eh? Think you can run a farm from studying a book!—Fools!" Not wishing to hazard in any way the job which I hoped would be mine, I passed the incident by without offering argument. I was impressed, however, at the attitude of my employer, and as I afterwards found to be the case, the attitude of many another. So in the next few minutes may I ask those who are already convinced to review with me the proofs of such a question, and to those doubtful, to consider and weigh thoughtfully the merits of such an institution, an agricultural college.

A Day of Specialization

To-day as never before is a "Day of Specialization." In business, in professional life, in almost any line of work which we may think of, there is that cry for the expert. And the reason is quite obvious, for how often have we heard of the youth in his first interview with business. "Yes," says the business man, "we might have placed you, but our concern is one of departments. If you had specialized you could step right in." In agriculture the same turn of events has presented itself.

Everywhere we look we find farms which for the main have a single product, and the need now as never before, is for the man who has specialized in that particular product. Where can the knowledge, the facts, the history of a question be gained in a more comprehensive way than in a college whose very life is the study of just such a subject. In order to meet this demand for experts, men must be developed and the training of an agricultural college is most vital. Push and personality are not the only things in life. A goat has plenty of push and a mighty strong personality.

The Demand is for Quick Results

We are living in a world which is running at top-notch speed. Everything is a-whiz and a-moving. The slogan of the day is faster, faster! We are living in a day when automobiles are made to travel at ninety or more miles an hour; when a steamship plows across the Atlantic in less than six days, and when you can flash a message around the world in as many seconds. Rush labels are being pasted on everything. This is the kind of a world we are going to compete with; over every avenue of life hangs this sign: "Get there, but get there quickly, or some one else will be in ahead of you." A hen is the only living critter that I know of to-day that can sit still and at the same time pay dividends.

However, do not misunderstand me; life is not a hundred yard dash, but more likened to a marathon, and I do not mean to insinuate

that we have to grow a crop of potatoes in a day, raise a flock of chickens in a night, or breed a herd of cattle in a week; but what I mean is this—that the knowledge acquired while here in college, coupled with the experience that we have, or will have gained, will enable us to advance stride for stride with this outside world of ours.

There is a common impression that the graduates of an agricultural college do not follow agricultural work after they have completed their course. This same idea has even impelled the Massachusetts Legislature to investigate their own State college.

But now through data most recently given out by our own farm practice department, we learn that in the class from 1906-1910,

"The Eastman Stage"

ONE of the big events each year in the students' life at the New York State College of Agriculture is known as the "Eastman Stage." Through an endowment, A. R. Eastman of Waterville, N. Y., provides substantial cash prizes each year to the students in the College of Agriculture who show the greatest skill in public speaking, knowing that what the schools or colleges can teach prospective farmers and farm leaders is not of any more value than to be able to express themselves orally, clearly and forcibly on farm affairs.

Long communication with nature makes the farmer naturally silent, which is one reason why he has not had his share for his own products nor proper consideration in public affairs.

The winners at the Fourteenth annual Eastman Stage contest held in February were: William Adams Flanagan and L. B. Pryor. We had the pleasure of hearing these speeches and they were so good that we asked for copies to pass on to you. Mr. Flanagan's speech is published on this page; Mr. Pryor's will be given a little later.—The Editors.

there were 614 men entered in the regular course, and of these 465 were graduated. Of these 465 graduates, 81.03 per cent are now in all lines of agricultural work. This is a truly representative class, for the graduates have been alumni long enough to become settled in the line of work which they are likely to pursue for life. Here are the authoritative figures; over four-fifths of the class in agricultural work.

It was only this past month that one of our agricultural journals chose twelve men who in their opinion have most profoundly influenced the thought and lives of American farmers or American agriculture. These men are commonly spoken of as the "All American Agricultural Dozen." Men such as Bailey, Henry, McCormick, Babcock, and others; and of these twelve, seven are college graduates.

And now no doubt some of you are saying that seven out of twelve is indeed a small majority, but investigate your present farm situation.

Over six million farmers, and I dare say that it is less than 2 per cent who are college graduates. Yet here are seven out of twelve who are college men, and these twelve have most profoundly influenced the thought and lives of American farmers. And then too, when you stop to think that it has only been in the past twenty-five years that the agricultural college has really performed or functioned as it should, and that when the students of these past twenty-five years will have had an opportunity to make their life impression, it will be more than enough to vindicate the college entirely.

The agriculturist heretofore obeyed certain natural laws, but did he reason why?

I doubt if it were anything more than an un-reasoning and inherited practice. In Orleans County, New York, there is a farmer who knows when to spray his trees, how to spray his trees, and why he sprays his trees. His four neighbors know he gets results and in like manner copy him. Learn the source of his information! He receives bulletins from the State agricultural college. He is using the finished work of men who have studied, tested, and experimented with just such a branch of farm labor.

Probably the most important and powerful instrument that the farmer now possesses is the farm bureau, an organization with a vast educational and economical aim, an organization which answers tens of thousands of letters yearly in response to questions which are difficulties to the farmer, an organization which acts as a supervisor

for experiments which are carried on on the farm, an organization which, upon the outbreak of insects or plant disease, dispatches immediately a county agent or specialist to the source of the trouble to see if it can be of any help. Here is an organization which is almost exclusively manned by college men. The State agricultural college has had such an influence that in New York State alone every county agent is a college trained man.

The Place of the Farm in Democracy

Friends, agriculture is a reality, being the food chest of the world, and as former director L. H. Bailey has said: "The farmer is the fundamental fact in democracy, not merely because he produces supplies, but because to him are we to look for the interpretation of the earth in our civic relations." These two facts alone

have made agriculture a business with an influence which reaches to the ends of the world. This college, though still in its infancy, is no longer an experiment, but a permanent institution, and in the words of its founders, is here "to improve agricultural methods, to develop the agricultural resources, and to elevate the standards of living in the rural districts."

Farming All Right—If It Would Pay

IN reply to a subscriber who asks in one of your issues as to whether farmers should stay on the farms, Yes and No. If we are to see no end of the trend of high and still higher prices for what we buy and see no hope of better prices for what we sell, then a most emphatic, Yes. Anyone who can do any kind of even common labor is a fool to stay on a farm. On the other hand if we could see prices adjust themselves to a more equitable level, than a most emphatic, No. But what hope have we of seeing taxes come where they should or manufactured products come down in price when the corporations are making millions and to escape their share of taxes are allowed to vote these dividends in shape of increased shares of stock. The trouble is the business man wants three or four autos and to get them, he increases the profit on the article he sells. We farmers are not so fortunate, we take what we are offered and pay taxes on all we have at the rate the politician puts on our property. My taxes have increased from \$78 in 1918 to \$207 in 1922 on same farm, and only \$400 increase in valuation. Where is it going to stop?—C. E. WOOD, Cortland County, N. Y.

Getting Rid of Unproductive Wet Spots

How to Install Drainage in Springy Places in an Otherwise Perfect Field

By A. M. GOODMAN

MOST farmers are continually planning on and making improvements. Some plan for improved appearance, some for greater convenience, while others count no change as an improvement unless they can see where a good cash return will be paid on every hour and every dollar expended. Just

the water to get into the tile than to come to the surface of the ground. The long wet streaks that extend down the hill are made wet merely by the spring water flowing over the surface and as soon as the spring is tapped the whole area will dry up.

Cat-Tails, a Sure Sign of a Wet Spot

now when we are going through a period of national unrest there is the natural tendency to neglect any improvements which are expensive or which do not promise immediate and profitable return.

Drainage has long been looked upon—and properly—as a most permanent

improvement and a most profitable investment. It has appealed to those who planned for better appearance, greater convenience and a cash return. While the scarcity of labor and the difficulty of moving freight may make it seem advisable to delay the tile draining of extensive areas, there never was a time better suited to the drainage of wet spots scattered through the tilled land, a condition so common in all of the rolling and hilly sections of the East. These jobs are small, can be done with the regular farm labor and for the time and money expended give the largest amount of drainage. Moreover, the clearing up of wet spots in otherwise dry land makes possible earlier plowing, better fitting, and obviates the expensive and exasperating experience of frequent turning, short bouts and last but not least, getting stuck in the mud.

The drainage of hillside areas is sometimes a little more difficult to get right, than that of flat land. In all drainage work, it is most important to locate the source of the excess water. This done, all that remains is to plan for the best and most economical means of carrying it to a proper outlet. On a hillside, wetness will usually appear in one of two ways, which show themselves either as wet streaks extending down the hill or as a series of wet spots strung along the face of the hillside. The former are due to springs. The treatment of this condition is to definitely locate the spring, which can be done with a little digging. When the source of the water is located, tile should be laid, preferably across the slope, to carry the water off. It is important in cases of this kind to have the tile go all the way across the principal source of water, and to cover the tile for several feet with small stones (figure 1) so that it will be easier for

same level. Let us study the source of the water in this case. Water that has fallen upon higher land has percolated through the more porous layers of earth until it has finally come to a stratum of clay, rock or other impervious material. It has worked its way along over this until it reached the point

Covering the tile with stones, where they are abundant, is an advantage, although not essential

where the stratum it was following came to the surface, and there it flowed out making the familiar wet spots.

The fact that much of the substrata is a plain, either horizontal or sloping, accounts for several of these wet spots occurring at the same level. Whether the seepage is found on the hillside or at the foot of the slope the remedy is the same. A ditch about two and a half feet deep, and with a fall of at least four inches in 100 feet should be dug across the face of the hill so as to pass through the upper edge of the wet area and a tile placed in it. A tile so located will collect and carry away this water underground without its ever reaching the surface. One other type of

drainage should be considered here. Some of our most productive land is undulating. The water flows from the knolls down into the depressions causing very uneven drying. As there is usually ample fall on such areas the solution is simple. Lay a tile through the lowest places, branching if necessary so as to collect the water from adjoining depressions.

In all three of these conditions a three-inch tile is large enough. Nothing smaller should be used, however. In order to keep to desired grade it may be necessary to lay the tile deeper or slightly shallower, but for the most satisfactory drainage one should plan to have about two feet of earth over the tile.

If any drain is to be successful the outlet must be kept clear and be screened to prevent the entrance of vermin.

Covering the tile, or backfilling as it is commonly called, should receive care. The tile is placed in the ground to collect water. If clay or hardpan are placed around the tile, water will not pass through it into the tile any more readily than it will penetrate these soils when in other places. They are in fact about as impervious as good concrete. The topsoil, then, with its roots, sod and stubble should be placed directly over the tile as this will permit the water to pass and enter the tile. After such sod and topsoils as are handy have been put in, it is well to take a shovel or a spade and break down the shoulders of the ditch. This has the several advantages of adding to the depth of topsoil over the tile, covering the tile deeply enough to protect it during the rest of the back filling, and of making the top of the ditch wide enough so that the furrow horse can walk in it, should one care to complete the job by backfarrowing with a plow and team. We are often asked whether it is advisable to cover the tile first with straw, paper or burlap to prevent dirt from going in at the joints. Our answer is that we have never found anything better with which to cover joints than a piece of sod.

Where field stones are abundant some farmers still use stone drains. These require a wider ditch and in every way more labor than a tile drain.

We have seen many stone drains that clogged after one or two years of service and we know of a few that have been in operation for over half a century.

Wet Spots Cut Yields and Profits

Vegetables For All the Year

Proper Storage Makes Orderly Marketing Possible

THE storage of vegetables is an important means toward the banishment of that dread period in late winter when most people take it for granted they will not feel well—when the big dark bottle of tonic and the little brown pill must be evoked. Plenty of tomatoes and carrots and spinach and onions and cabbage and squash accomplish the same object and to much greater advantage.

The man on the farm may well recognize as his first duty in this connection the providing of an ample supply of winter vegetables for the family. Then he may delve into the question as to whether he can with profit help the distant city dweller to "eat vegetables for vitamins" in February as well as August.

The principles of commercial and home storage are the same. If the commodity is to be sold, it is necessary to consider well the state of the markets to be served, the probable crops in other sections and the various items of cost which are involved. These last mount much larger than a casual examination of the matter would suggest. To learn the price that one must realize out of storage it is necessary to think of interest and depreciation of equipment,

extra labor in handling in and out, sorting and trimming, extra hauling, heating and ventilation, if buildings are used, and the usually heavy losses through shrinkage and decay.

Stored vegetables are not dead. Life processes continue. The most important of these processes, respiration, releases energy that is stored in starch and other substances. In the field this energy is used in growth, while in storage it takes the form of heat? Respiration slowly but surely consumes the substance of the stored material. A low temperature serves to retard this process. This explains the necessity for a cool place to store vegetables.

Moreover warmth favors the development of fungous and bacterial diseases which cause decay in many forms. On the other hand freezing temperatures break the plant cells and in other ways injure or kill, leaving the way open for the decay which speedily overtakes all dead material. It is generally held that fluctuation in temperature is also harmful.

Ventilation is Essential

Water constantly evaporates from stored products, causing shrinkage as well as deterioration in quality. The dryer the air in storage, the more rapid is the evaporation. If the air is too moist, water condenses, thus favoring decay. Ventilation is of value for the removal of waste gases and as an aid in the control of moisture and temperature.

The last and most important requirement is that the vegetables stored shall be in prime condition. It does not pay to invest space and labor and to accept risk for produce that is not of the best. All bruises, cuts and diseased spots should be avoided as these blemishes are frequently the starting points for decay which speedily spreads to otherwise healthy specimens. Produce should not be over-mature as ripening continues in storage and over-ripe specimens soon go down.

Perhaps the best and handiest place for home storage is a well protected cellar where ventilation is possible and where the temperature can be maintained just above freezing. In the house, the storage room should be partitioned off from the rest of the cellar especially if there is a furnace. A

By PAUL WORK

bottom helps keep the moisture content of the air more nearly correct. Ventilation may be provided through a simple opening near the ceiling. Better still, there may be openings at top and bottom. In the fall the room may be kept cool by opening at night and closing in the morning. Later this arrangement may be reversed.

Outside wooden walls are best made frost proof by providing dead air spaces. Dry still air is the best insulating material. Also walls may be banked outside and the roofs of outdoor cellars or caves may be covered with earth, straw, manure, leaves or other suitable material.

As far as quality of the product when taken out is concerned there are few methods of storage better than

burying, although the risk is increased as there is little control of temperature and moisture. Freezing results if covering is too light, while heating and decay follow if too much protection is given.

The first requirement in burying is to select a spot that is well drained and accessible. The shape of the pit is unimportant, though six or eight feet is generally wide enough and the length may be

adjusted to suit. It is well to place a layer of straw in the bottom, and then pile the vegetables in a ridge. If the heap is to be opened at different times, it may be divided with straw or leaves. Straw or hay or leaves are used to cover the vegetables, then alternate layers of earth and straw, leaves or manure are added until the required protection has been provided.

In the fall it is well to avoid covering tightly at the top and final closing may be delayed until severe weather sets in. If the heap of vegetables is large it is worth while to set a sheaf of rye or a bundle of straw in the middle every few feet to provide a little ventilation.

A very simple way to store vegetables is to put them in a barrel and bury it, using leaves or straw so that the end may be readily accessible.

The root crops, potatoes and cabbage are not at all difficult to store. All that is necessary is to observe the general principles, many different methods being equally successful. Cabbage is sometimes spread in the woods and covered with leaves, although the present tendency for commercial storage is toward the use of special insulated houses. Immature cabbage will harden up wonderfully if stored roots on in a trench. Parsnips and salsify for spring use may be left in the ground where they grew. Onions keep in common storage but they require a drier atmosphere than most vegetables.

They will keep well in a cool attic. Squash and sweet potatoes should have a higher temperature during the first few weeks of storage and may well be kept at say 60 degrees all winter. Celery is one of the most difficult of the vegetables to store successfully. It keeps well in trenches but must not be too heavily covered at first. More celery is lost from heating than from freezing. It may well be kept in the cellar in boxes with the roots in moist earth. When a cellar tends to be overdry, vegetables of most sorts may be packed in soil which will hold moisture all winter.

"We have been taking your paper for over twenty-two years."—Edward Zeitz, McKees Rocks, N. Y.

A closed pit of beets and carrots. The basket covers the vent. When severe weather sets in, this is covered with straw and manure

is Today the Most Progressive

Your Copy of this New Fall and Winter Catalogue is Waiting for You

One copy of this new complete Catalogue is here—waiting for you merely to fill in the coupon below with your name and address.

Your copy of this Catalogue is waiting—to bring into your home the lowest prices of the year, to bring to you and your family an opportunity for saving so important that you can not afford to miss it.

This Book Keeps Prices Down

You too may as well save money on nearly everything you buy. Ask for this Catalogue and see for yourself the lowest price, the right price to pay. You do not need to pay more.

In our work of "keeping prices down" we have searched the markets of the world. Over Forty Million Dollars' worth of goods have been bought at the lowest possible prices and the savings are passed on to you.

And with this saving, with these low prices, there is also an assurance of dependable quality—Ward Quality. We sell only the kind of goods that stand inspection and use—the kind that will hold your patronage. We maintain the standard of Ward Quality no matter how low the price.

Everything for the Home, the Farm and the Family

FOR WOMEN: This book shows the best New York Fashions, selected in New York by our own New York Fashion Experts. And everything is sold without the usual "fashion profits." This book will be a delight, a matter of style news, and a saving to every American woman.

FOR THE HOME: Carpets, furniture, bedding, electrical devices, everything new for home use, everything used in decoration and to make the home modern and complete. And the prices always mean a saving.

FOR THE MEN AND THE FARM: Everything a man uses or wears, from tools and hardware and famous Riverside Tires, to virgin wool suits—often one-third less than prices you are paying.

The coupon below brings this new, complete Fall and Winter Catalogue to you and your family—entirely free.

News From Among New York's Farmers

Hudson Valley Fruit Growers To Market Cooperatively—County Notes

THE Hudson Valley Fruit Growers' Cooperative Association, which is a federation of local grower-owned packing houses in the Hudson River Valley, started on its first season of cooperative marketing last week. This federation was organized and incorporated about a year ago, with the object of ultimately spreading the fame of Hudson Valley fruits through use of modern methods of grading, packing and marketing. Included in the central association are the local cooperative packing associations at Claverack, Coxsackie, Ulster Park, Germantown, Red Hook and Ravena. The packing of the fruit will all be under central supervision. The Herschel Jones Marketing Service has been engaged to take over the sales management and distribution. All the fruit of a given variety and grade will be pooled from all the locals.

The business of the central association will be conducted by a board made up of one representative of each local association. The officers are President, Clifford L. Miller, Claverack, New York; Secretary, K. B. Lewis, Red Hook, New York; and Treasurer, R. R. Livingston, Germantown, New York.

considering the moisture conditions, and is leading those who have grown clear oats for feeding to thinking of mixed grain.

Moisture conditions in St. Lawrence and Lewis Counties have been somewhat better in most parts, which resulted in a larger hay crop than normal and of much better quality. Corn is much below normal. Grain crops are much the same all through this part of New York.

League Purchases Five Plants

The purchase of five plants on the New York Central Railroad by the Dairymen's League has created much interest. They were formerly owned by the E. W. Coon Cheese Co., and are equipped both for shipping market milk and for making cheese. As the farmers are already complying with the Board of Health requirements, it is believed that the buy is most advantageous. Brownville, Chaumont, Rosiere, Clayton, and La Fargeville plants were taken over.

Threshing Fires Alarming

Threshing machine fires have already started. Last year a number of these around the north country led to many conjectures as to the cause. In many cases the straw catches fire—apparently all at once, and in a few minutes the whole barn is gone. As practically all the fires were started while the threshing was being done by gasoline-driven motors, and always in the straw, it seems that there is some sort of spontaneous combustion caused while the straw is being driven through the blower pipe. The number of these fires last season caused an extra assessment by the Patrons' Fire Relief Association, which insures many of the North Country farm buildings.—W. L. R.

NEW YORK COUNTY NOTES

Jefferson Co.—The first heavy rain in two months is falling to-day (August 21), and it is music to the farmers' ears. Cows have been on grain rations for some time and their milk flow is continually shrinking. Corn was at a standstill, and new seedlings, which had a good start, began to look like a failure. Early potatoes are being dug. In some places they are very good, while in others they are very small. Growers think, however, that this rain will help the late crop. July milk in the F. X. Vaumart brought \$2.10 for 3 per cent milk. Butter is 50c a pound; eggs, 30 to 40c; fowls, 20 a pound, live weight; 30c dressed; veal, 11½ to 13c. Hay buyers are beginning to press new hay and are offering men \$10 to \$13 a ton, but farmers are holding off as there is a lot of good hay in this locality and they want more money for it. The grain crops were very good this year.—MRS. C. J. D.

Sullivan Co.—The weather has been very cold. The berry crop has been a failure. Apples, peaches, and plums won't do much better. The extremely dry weather has been responsible. Gardens are not up to normal. The summer boarder business this year has been very poor. Butter, 45c; eggs, 40c.—C. P. M.

Chautauqua Co.—The spell of dry weather that we have been experiencing is the longest in many years. As a result, the potato crop will be short. Buckwheat stood absolutely still for weeks. We have had a few showers, but the rainfall was not enough to give much relief. As a result of this dry spell, many farmers are very short of water for their live stock.—P. S. S.

Nature Abhors a Vacancy

(Continued from page 171)

the best orchard stock, knowing that that acre will soon be worth one thousand dollars—or nothing if a wholesale mistake has been made?

In conclusion: In anticipation of the reader's question upon the point, we not only make a practice of buying of the nearby, well-known nurseryman,

but in late years have usually bought only trees he has grown for us—trees worked with scions or buds provided by us. This is no little extra trouble for the nurseryman, but we are glad to pay for this extra service, and I believe that between the lines above you can read our reasons for doing this.

We also sometimes set a block of apple trees to all extra one year Northern Spy whips to be top-worked one or two years later from our own bearing trees, and this too, is an excellent way. There is nothing to beat a Spy body for hardiness and thrift whereas we are too far South to properly grow the fruit of this wonderful apple.

In a less degree all of the above is true when buying other tree fruits than apples, while caution is even more vital in wholesale purchase of such small fruits as raspberry, strawberry and the shrub fruits, especially in regard to diseases. Particularly with the strawberry plant market is there a wide variety of standards of honesty, and in consequence, many commercial fields are too badly mixed to replant from, even upon the same place, for uniformity is exactly as desirable in packing this delectable fruit as in boxing apples. It pays.

And finally, given an entirely honest-to-name berry plant, there is still the grave question of that plant's vigor and fecundity—for herein, poorly selected plants, from the same field may vary 1,000 per cent—but that is another story.

Lancaster Tobacco Growers Hold Field Tour

W. L. CALKINS

ON Monday, August 20, 1923, about eighty of the members of the Lancaster County Tobacco Growers' Association participated in their annual tour of inspection and field day, under the direction of F. S. Bucher, the county agent of the Lancaster County Farm Bureau.

The first stop was made at the farm of J. N. Lindeman, south of Washington Boro, and an examination made of his fine field of Havana tobacco. This field has been in tobacco for five years past, rye having been sown as a cover crop after tobacco harvest. The second stop was at the farm of B. F. Hiestand, where a field of 22 acres of especially fine seed leaf of the Slaughter variety was admired, among which were six rows of the Hibshman variety, that showed even better quality than the Slaughter.

Then stops were made at the farms of Daniel Erb, in Donegal township, who has about 14 acres, that is well advanced and will soon be ready to cut; Mr. Strickler, near the old Donegal Presbyterian Church (founded in 1722), where, besides viewing a fine crop of tobacco, the party enjoyed a bountiful lunch as guests of Mr. and Mrs. Strickler, assisted by some of their neighbors.

The first stop in the afternoon was at the Kauffman farm, south of Landisville, where Harry Swarr has six acres of splendid tobacco, stalks examined having 14 and 15 leaves. This appeared to be of the Slaughter variety.

From Landisville the party followed the State roads through East Petersburg, Neffsville, and Akron to the Hibshman farm at Ephrata, where is located the experiment plots of the U. S. Department of Agriculture and Pennsylvania State College, which are in charge of Otto Olson. These plots were examined and Mr. Olson gave an interesting talk.

These plots did not show the usual results from the different methods of fertilization, for the reason that the season has been so dry that the plants did not have sufficient moisture to use the fertilizer available.

Mr. Olson stated that the past experiments have shown that 1,000 pounds stable manure, 500 pounds cotton-seed meal, 200 pounds sulphate of potash, and 300 pounds of acid phosphate, to the acre, has given best results, as compared with cost of fertilization. He strongly recommended "double manure salts" (a German product containing about 30 per cent potash). However, this year Lancaster County growers had been able to procure but little, the Connecticut growers having taken the supply coming to this country. Steps were being taken to get a supply for future use, for \$20 per ton or less. He said that German potash is suited to tobacco (American potash containing too much borax), and that muriate of potash was not a good tobacco fertilizer, and tends to make the leaf too dark in color.

One of the ends sought at the experiment station is to produce a mild cigar tobacco, and that the percentage of nicotine had been reduced from 3 per cent to one-half of 1 per cent. Experiments are also being conducted with four kinds of Rustica tobacco, running as high as 10 per cent nicotine, for use in insecticides. One kind having been recently imported from the Congo region in Africa.

The two best varieties of Lancaster County cigar tobacco thus far produced are the Slaughter and the Hibshman. The Slaughter has shown high resistance to rust and to pole-burn, but Hibshman is considered still better, giving an average yield of about 300 pounds per acre over other varieties. It also gives a tobacco better grade, texture, and color. It is a cross, made some twelve years ago, of the Slaughter on the Taylor. It also has the advantage of more upright leaves spaced farther apart on the stalk.

The Olson is a variety that was developed especially for the Clinton County growers, who require a tobacco maturing earlier than is required in Lancaster County.

The party then hastened to Ephrata Park, where dinner was served, after which many interesting "talks" were

Invest in a McCormick-Deering for Fall Plowing and Belt Work

The remarkable new warranty covering the crankshaft and the crankshaft ball bearings in McCormick-Deering Tractors has shown the farmer more clearly than ever that he can best depend on these tractors for real value and economy. This is a guarantee for the entire life of the tractor and that means much.

It may well prove the deciding factor in your own investment. The ironclad agreement, printed below, provides you with a lasting security covering these important parts of the tractor. It is evidence of quality in the entire tractor. It is an indicator of practical design, accurate assembly, generous size of parts, and long life.

The fall season is ahead—a season of many power jobs, both drawbar and belt. Do your plowing speedily and well with a McCormick-Deering and fit your tractor to fall and winter work. McCormick-Deering Tractors are designed to handle belt jobs as you want them handled. And McCormick-Deering machines are made to work right with tractors. The combination can't be beat.

Stop at the McCormick-Deering dealer's and go over the construction and the features of these tractors. Study the value of replaceable wearing parts, the unit main frame, ball and roller bearings at 28 points, etc. And remember this important point: When you buy a McCormick-Deering Tractor you get all necessary equipment—throttle governor, belt pulley, platform, fenders, brake, etc. No extras to pay for. Make your power investment safe from every point of view by placing an order for a McCormick-Deering 15-30 or 10-20 Tractor.

SPECIAL WARRANTY given every purchaser

The seller agrees to replace free the Two-Bearing Crankshaft in any 10-20 or 15-30 McCormick-Deering tractor, should it break during the life of the tractor, provided the broken parts are promptly returned to the factory or one of the branch houses.

Further, the seller agrees to replace free any Crankshaft Ball Bearing in the 10-20 or 15-30 McCormick-Deering tractor, which may break, wear out, or burn out during the life of the tractor, provided that the defective ball bearing is promptly returned to the factory or one of the branch houses.

INTERNATIONAL HARVESTER COMPANY

606 So. Michigan Ave. of America Chicago, Ill.
[Incorporated]

listened to. Frank P. Willets, Pennsylvania Secretary of Agriculture, stated that he knew more about mushroom growing than tobacco culture, but gave some instructive statistics on tobacco production, and closed by giving some important information in regard to the Japanese beetle, and the methods taken and in contemplation to check its spread.

F. D. Gardner, head of the Farm Department of the Pennsylvania State College, spoke of general farm conditions, as well as those relating particularly to tobacco, and urged the production of quality rather than mere quantity. P. W. Baker of Landisville, among other things, urged Lancaster County farmers to keep more land in grass, and apply their labor and fertilizer to a smaller acreage of plow land. L. Rupin of Akron made some pithy remarks and caused some hearty laughter by an application of some humorous stories to the farmers' condition, as he viewed it.

It was stated at the meeting that present conditions showed an 85 per cent tobacco crop in the State. However, it would seem throughout Lancaster County (where 80 per cent of the Pennsylvania tobacco is grown) that unless there is a combination of exceptionally moist and growing weather during the remainder of the

season, with no frosts until very late, a much smaller percentage may be expected.

In the average field it is uneven and stunted, on account of the exceptional dry weather, and adverse conditions at the time of transplanting, although the color is good, with little rust yet appearing, and no wildfire.

While an unusual amount of tobacco is reported in the hands of packers and manufacturers, a large proportion of this is of the lower grades, and growers who are fortunate enough to harvest and cure a prime crop should receive a good price.

Mr. Olson stated that Havana tobacco in Bradford County was being sold at 30 cents in the field, and growers of Havana in this county should receive even a better price for crops of a good quality.

PENNSYLVANIA NOTES

OLIVER D. SCHOCK

Early varieties of potatoes proved disappointing in yield, owing to the protracted drought. Even the Irish Cobbler failed of its usual prolific yield. Russet and other late varieties were better favored by rains and will produce a larger crop. The Colorado beetle was less in evidence and more

readily controlled by modern methods of potato culture.

Pennsylvania buckwheat will fall fully one million bushels short of last year's yield, according to the latest official estimates. The crop of 1922 was 5,208,000 bushels, while the present forecast for 1923 is 4,283,000 bushels. The buckwheat production, as usual, far exceeds that of any other State. New York ranks second in yield, estimated at 3,887,000 bushels. Twenty States are classed as non-producing buckwheat sections of the United States, and depend upon the East for their supply of buckwheat flour.

The threatened reduction in the acreage of wheat to be sown in eastern Pennsylvania this fall will be a reality. The decrease will probably be between 10 and 15 per cent. No white wheat is grown in this section, the long-berry red variety having supplanted all other varieties.

Family trade prices of milk containing 3½ per cent of butterfat at present are as follows: Harrisburg, 13c; Philadelphia, 13-15c; Reading, 12-14c; Pittsburgh, 14c; Erie, 14c. Fall pasturage has improved. Cattle are in a good condition.

Pennsylvania produced an almost normal yield of peaches, and prices are regarded as fairly satisfactory, ranging from 50 cents to \$2 per basket.

Give a thought to Advertising

A Barber, a Banker and a Circus Spiel

"GO to the circus?" asked the cashier of the Bank of Fentonville as he dropped back in the barber's chair for his Saturday afternoon shave.

"Yeah; I went a little while last night after I closed up. Some circus!"

"Some circus is right," said the banker, "and it was some advertising stunt we pulled. You saw our big sign and heard the ring-master tell about our bank, didn't you?"

"Yeah; I saw the sign and I heard the spiel. Wouldn't have thought of it again though if you hadn't mentioned it."

"Pretty clever stunt we call it," was the banker's reply.

"Yeah; clever for the announcer and sign painter. What did it cost you?" the barber asked sharply.

The question popped out so unexpectedly that for once the banker told the bank's business and admitted proudly that the expense had been \$112.

"Say you! Listen to me!" bawled the barber, as he swung his lather brush across his patron's face and shut off anything he might have said further. "That guy paid \$12 for the sign and got a hundred for shouting three minutes twice a day. He does that six days a week because he finds one in every town. In the season he makes more than your bank does. You call that advertising? You got an idea folks at the circus bring any money to your bank because of a spiel at a three-ring circus? Nothin' to it! They were laughing at clowns or getting nervous about the lions. If you want to do some advertising, you take your \$112 and pay the editor of *The Bugle* \$2 a week as long as the money lasts. Your ads in the paper will tell all of those people about your bank every time they look it over, something different every week. It won't go in one ear and out of the other."

The barber was quiet for almost a minute. The banker was quiet, too. He was thinking. The barber had told him something.

Then from the barber, rather gently, "Did that fellow deposit the \$112 in your bank? No? Well, whenever you pay the editor's bills he puts the money right back in circulation here."

"Razor hurt? No? I thought you kinda scinged a little."

The above little spiel came across our desk the other day. It was sent out by the New York State School of Agriculture at Cornell University. It illustrates so well the point that something clever is not always good advertising, especially the so-called "stunt" advertising. We thought it so good, we have reproduced it for you.

Advertising Manager

Putting the Henhouse in Order

Before the Birds Go Into Winter Quarters Get Rid of Lice and Mites

By FRED. W. OHM

IT won't be many moons and snow will be a-flying. Even before that time we will undoubtedly have some cold, wet fall days when it will be more comfortable and a great deal safer for the birds to be inside, where they can scratch in nice clean litter.

Such being the case, between those raw fall days and now, it is a pretty good proposition to put the henhouse in order—fall housecleaning so to speak. It is a pretty good job for this time of the year inasmuch as harvest is pretty much a thing of the past, and makes a tolerably good filler for rainy-day work when it is too nasty to fill the silo or do fall plowing.

As long as housecleaning is in order it is just as well to do any fixing that is needed, such as mending the roof, doors, windows and curtains, killing two birds with one stone. In fact it isn't a bad idea to take out the dropping boards, roosts and nests, because we have to get in all the cracks anyway to spray for lice and mites that are in hiding there.

Lice and mites are really the ones that make fall henhouse cleaning necessary. During the summer, with haying and grain harvest and a thousand and one other jobs that keep a farmer busy from daylight to dark, lice and mites are often overlooked. It is during that time that they multiply rapidly. Now, fall and winter eggs bring money—but if a hen has got to be busy fighting lice all day, she can't think a great deal about laying eggs. And during the night—the little gray mites emerge from their hiding places in the cracks and crevices about the roosts and attack Biddy, sucking her blood. The blood turns the color of the mite red—hence the name, red mite. Biddy gets it day and night.

Spray Must Hit Insects

The main thing to bear in mind in fighting lice is the fact that whatever spray material is used, it must be so applied that it hits each and every insect. Lice and mites obtain their food by sucking, and any amount of poison scattered about will be of no avail. The insect must be destroyed by applying a dust that will clog up the breathing pores on its body or the insect must be hit with some chemical that will cause its body to corrode. Such a spray is called a contact spray. It must be applied liberally so that every insect will be hit. Halfway measures are of no avail, for those insects that remain reproduce rapidly and the work is for naught.

There are many commercial preparations on the market containing chemicals for fighting lice and mites. These are especially convenient for the man who has little time at his disposal, for the man who has an extensive poultry plant and must cover a great deal of ground in a short time, and for the man who is a distance from town and can't run to the store for added quantities of ingredients that go into homemade preparations. Most of these commercial preparations are put up in such a way that the farm woman who has her small flock can easily apply the material. These commercially prepared sprays are made up of carbolic, creosote or coal-tar products. They are advertised quite generally and are uniformly good. The companies that advertise usually speak for themselves.

There are a number of homemade preparations that work admirably. There is one we used with complete success, and there are others who say they have used the same material, recommending it as unsurpassed. The material is nothing more than lubricating oil drained from automobile engines.

Every thousand miles or so the oil should be drained from the engine and replaced with fresh lubricant. This "dead" oil makes a wonderfully contact spray to kill lice and mites.

Of course, not everyone has a car and not everyone lives near a garage. Garage men usually throw the "dead" oil away. If you have a friend who is a garage man perhaps he will let you have some if you leave a couple of five gallon cans at the garage so he doesn't have to store it.

This material may be applied by using a small common bucket spray pump. This is a convenient way to apply it, for the stream can be directed into every nook and corner. If it is too thick it may be diluted by adding a gallon or so of kerosene. In the absence of a spray pump it can be applied with a brush. Of course it must be applied liberally in order to get into every crack, crevice and corner. Obviously it will darken the roosts, dropping boards, nests and other parts to which it is

thumb and finger) among the feathers next to the skin on the head, neck, back, under the wings, on the breast, below the vent, and at the base of the tail.

Not more than twelve small pinches should be put on one fowl at a time, as too much is injurious. One pound of powdered sodium fluorid applied in this manner will treat 100 fowls. Sodium fluorid, if inhaled, is very irritating to either fowls or human beings. In fact, if too much is inhaled by fowls or chicks it may prove fatal. Therefore, care should be taken in treating fowls to see that it is not inhaled or allowed to get into any cuts or wounds in the flesh.

Blue ointment is another effective remedy. In using it apply a small portion (a piece about the size of a pea) with the fingers around the vent only of the fowl, and not on the body or under the vent, as it is poisonous and injurious. If mercurial ointment (a similar preparation) is used instead of blue ointment, it should be diluted with one-half the quantity of vaseline or lard.

Lice powders of various kinds are also on the market and may be used oftentimes with good results. These lice powders should be dusted well into the feathers, holding the bird's head down, working the powder in with the fingers, especially under the wings and around the vent to make sure it reaches the skin. If all the lice are not killed by the first treatment, the fowls should be dusted again in a week or ten days and as often afterwards as found necessary.

Head lice, so called because their habits,

are found on the heads of both chicks and mature fowls, but most often on young chicks. They are longer and more slender than body lice and dark brown in color. They are almost always in greatest number on the top of the head, around the ears, and underneath the bill, and are usually found with their heads close against the skin of the chicks, the body extending outward. Head lice are very injurious. They breed rapidly and pass from the mother hen to young chicks and from one chick to another, which makes it necessary to watch the flock carefully in order to keep the chickens free from these pests.

To kill head lice on chicks, a very small portion of melted lard or vaseline should be applied to the top of the head, under the wings and around the vent. Care should be taken not to get too much grease on the chick, as that might prove fatal.

ADVOCATES MOTHER OF VINEGAR IN POULTRY MASH

C. W. PIERCE

I see in your issue of April 21 about the mother of vinegar being used to moisten dry mash to stop hens from eating eggs and I also note your reply.

I differ with you in regard to that matter. I have used vinegar in dry mash for over ten years, and it certainly will stop hens from eating eggs. As soon as I see that they are eating eggs I mix them a good feeding of it, making it real wet, and feed two or three times; that most always stops them. If not, I give them some more.

I see that you say you doubt if they would eat the vinegar alone. I have seen them when fed the mash for the first time, if it was real wet, drink the vinegar up first, then eat the remainder of the mash. My hens always have free range and plenty of fresh water.

A dry, clean, well ventilated house is essential if you want healthy, vigorous birds and egg production

applied, but the hens won't mind as long as they are free of the lice and mites. Another advantage of this material is that when the wood is well soaked with this oil the insects won't harbor there.

Some folks use plain kerosene and recommend it highly. Others complain that it is hard on the man who has to spray it. One precaution must be taken and that is that no lighted candles, lanterns, pipes, cigars or other exposed flames, should be anywhere around the henhouse as the kerosene vapor is more or less inflammable. Unless this caution is taken there is apt to be a fire, and a serious one. Of course, it will get rid of the lice and mites, but it is a pretty expensive method.

Another good material is whitewash to which crude carbolic acid is added. This is made as follows: Slake half a peck of lime and dilute it with twenty gallons of water; add 1 pound of salt previously dissolved in water; to this mixture add 2 quarts of crude carbolic acid. Apply with a spray pump or brush. This mixture if properly put on not only kills the mites but destroys all their eggs, and will make the house, or any building where it is used, fresh and clean.

Rid the Birds of Vermin

Now, as long as the house is clean everything would be fine and the job would be finished. But the birds also need attention. Unfortunately lousy houses make lousy birds. It is too bad that clean houses cannot make clean birds. Therefore, before the birds are placed back on clean roosts, or in clean nests, they must be treated with louse powders or ointments. Inasmuch as lice stay on the fowls nearly all the time, the only effective treatments are those which are applied directly to the birds.

Sodium fluorid, a powder which can be purchased at most drug stores, is a most effective remedy. It is applied by placing a small amount of the powder (as much as can be held between the

Raising Healthy Calves

My Experience With Pure-Bred Guernseys

WHEN the editor of the American Agriculturist asked me to write about our experience in raising calves, I hesitated to do so. Pretty generally we have been able to save and raise into healthy animals all of the calves dropped on the farm. Last winter, however, we lost five splendidly bred Guernsey heifer calves all in a row. Because of these losses I wondered in my own mind whether I was qualified to discuss the subject.

However, when they occurred, we took our troubles to Dr. D. H. Udall of the New York State Veterinary College. Dr. Udall represents that rare combination, unusual technical knowledge, practical experience, and common sense. So to-day I took the editor's request up to Dr. Udall at the college.

I asked him what were the objectives in caring for a newborn calf. He replied unhesitatingly that they were, first, to guard the calf from the digestive troubles which always follow overfeeding; second, to prevent the calf from eating any material which would cause his digestive system to become deranged; and third, to maintain the birth weight and increase it as rapidly as possible.

"New-born calves," said Dr. Udall, "enter upon an artificial existence. The milk of the dam immediately after freshening is abundant and rich. The development of the digestive organs of the calf before birth has not kept pace with the udder development of the modern dairy cow. So if the calf is left too long with the dam its stomach becomes overloaded, and this gives rise to abnormal decomposition of the contents of the stomach and the absorption of poisonous material into the circulation."

The Prevention of Indigestion

The prevention of digestive troubles depends upon the observation of a few simple rules. These Dr. Udall gave to me as follows:

1. Allow the calf to remain with its dam for the first twelve hours. This provides colostrum, but does not permit overeating.
2. On the second day, withhold all milk unless the calf shows evidence of great hunger, when it may receive eight ounces each of its dam's milk and limewater at body temperature.
3. On the third day, feed four to five per cent of the body weight of the dam's milk mixed with an equal amount of limewater at 100 degrees Fahrenheit.
4. At the end of the first week the calf may receive eight to twelve per cent of its body weight of milk; by the end of the second week this may be brought up to ten to fourteen per cent of the body weight. Feed morning, noon, and night; each feeding should contain a pound of limewater. Warm the milk to 100 degrees Fahrenheit and feed in individual pails.

"The pails from which calves are fed," said Dr. Udall, "should be rinsed after each feeding in cold water and then scalded. Housing conditions should protect calves against extreme cold, sudden changes in temperature, and cold drafts from open doors. They should be kept dry, warm, and clean.

By H. E. BABCOCK

Each calf should be provided with an individual pen. During the first week, before the noon feed, take the temperature. If it is 103 degrees Fahrenheit or more, give an enema and three ounces of liquid petrolatum and withhold feed until the temperature is normal and the calf ravenously hungry. At birth give three ounces of liquid petrolatum to a seventy-pound calf.

"Each calf should wear a muzzle until one month of age; this prevents ingestion of filth and indigestible substances such as straw or shavings. Normal healthy calves will lick and swallow any substance within reach. A small handful of straw or other foreign material in the stomach retards digestion and growth, and often is a direct cause of death."

Stumped!

MR. BABCOCK, the author of the article on this page and one of our regular contributors, is the owner of an unusually fine herd of pure-bred Guernseys. Henry Morgenthau, Jr., publisher of the American Agriculturist has an excellent herd of pure-bred Holsteins. When these two get together there invariably ensues a jolly controversy relative to the merits of each other's chosen breed. Recently we were visiting Mr. Babcock's farm and while we were going through the barns and looking over the herd, Mr. Morgenthau spied an old Holstein cow tucked away over in one corner almost out of sight. He called Mr. Babcock over and asked him to explain. For a moment Mr. Babcock was somewhat confused and as is characteristic with him when embarrassed, stood first on one foot and then on the other. He finally managed to get out the explanation, "Oh, that old cow—why we have to have her milk to raise our Guernsey calves" and then promptly changed the subject.

accumulate in their stomachs, where they become the cause of all sorts of subsequent disorders. The muzzled calf, fed in a clean pail, has practically every means of infection removed from it.

Knowing that he had kept careful records on several of our calves, and believing that readers of the American Agriculturist might be interested in such records, even though they are impractical in farm practice, I prevailed on Dr. Udall to turn over his data. I have selected from his charts one which gives the record of the calf of Carman-cita of Larchmont.

This calf, a pure-bred Guernsey bull, was born on April 24, 1923, at 11:30 a. m. He weighed 82 pounds. He was left with his dam until 8 a. m. April 25, when he was removed. At 11:30 on that day he weighed 85½ pounds, a gain of 3½ pounds. He was not fed until April 26, when he weighed 84 pounds, and was given four pounds of milk in three feedings, the same being equal to 4.76 per cent of his body weight. The next day he was fed 7 per cent of his body weight in milk; the next day, 8 per cent, and a week later 10 per cent. In the meantime he had gained up to 90 pounds.

Birth Weight Maintained and Increased

On May 9, two weeks after birth, this calf weighed 94.5 pounds, and was getting nine pounds of milk a day, equal to practically 10 per cent of his body weight. Records were continued up until the 28th day of May, when he was eating 13 per cent of his body weight in milk and weighed 121½ pounds.

Similar records on other of our pure-bred Guernsey calves cared for as out-

World's Greatest Dairy Cattle at the NATIONAL DAIRY EXPOSITION

Great exhibit of 1,500 head of selected dairy cattle—pure bred, grade and Club calves—from every section of the country, representing all the dairy breeds. An opportunity for you to inspect them—in one big barn—compare their good qualities and learn how to produce the most milk at the least expense. See the world's most famous bulls and the cows that produce the most milk and the richest cream.

DAIRY FARM EQUIPMENT DISPLAY

Over two miles of farm and dairy machinery—a great exhibit of new and improved milking machines, cream separators, barn equipment, churns, and a thousand and one other articles to lighten labor and increase profits on the farm.

U. S. DEPARTMENT OF AGRICULTURE'S EXHIBIT

Showing modern practices in breeding and feeding cattle and in marketing dairy products.

Meetings and Conventions of Dairymen Every Day

20 Extra Quarts of Milk Count 'em From Every Sack of International Special Dairy Molasses Feed

as compared to using wheat feeds or ground grains. We guarantee this increase has been secured in hundreds of actual tests. INTERNATIONAL SPECIAL DAIRY MOLASSES FEED contains protein, molasses and fat combined in proper proportions to provide the necessary nutrients and energy required for maximum milk production. Both protein and molasses produce milk. Special Dairy contains both.

This great feed is digestible and palatable and is skillfully processed and mixed, thus insuring a big extra gain in milk. Accept no substitute. Inferior brands offered by other mills cannot produce the same profitable results as Special Dairy.

BEFORE YOU BUY A WINDMILL

Carefully consider the following facts: The Auto-oiled Aermotor is the Genuine Self-oiling Windmill, with every moving part fully and constantly oiled.

The Auto-oiled Aermotor has behind it 8 years of wonderful success. It is not an experiment. The double gears run in oil in a tightly enclosed gear case. They are always flooded with oil and are protected from dust and sleet. Oil an Aermotor once a year and it is always oiled. It never makes a squeak.

You do not have to try an experiment to get a windmill which will run a year with one oiling. The Auto-oiled Aermotor is a tried and perfected machine. Our large factory and our superior equipment enable us to produce economically and accurately. Every purchaser of an Aermotor gets the benefit from quantity production. The Auto-oiled Aermotor is so thoroughly oiled that it runs in the lightest breeze. It gives more service for the money invested than any other piece of machinery on the farm. The Aermotor is made by a responsible company which has been specializing in steel windmills for more than 30 years.

Answers To Questions From A. A. Readers

What is the principle by which a hydraulic ram delivers water, and what does the vacuum chamber do? Also, why is it necessary to have a vacuum chamber on all steam or power pumps?—I. D., New York.

THE principle upon which the hydraulic ram operates is the utilization of the momentum of the water falling in the drive-pipe, this momentum being changed into a force to drive part of the water up through the delivery pipe to the faucet. In a hydraulic ram there are two main valves, one of them the waste-valve, the other a check-valve.

Let us start assuming the waste-valve is open. The water flows out through it with increasing velocity until finally the current becomes strong enough to close the valve, which is held open either by a light spring or a light weight. The valve is closed suddenly, of course, and the impact of the water opens the check-valve. Some of the water coming down into the drive-pipe passes through the check-valve and enters the delivery chamber. A pipe leads from the delivery chamber to the place where the water is to be used. As the process is repeated over and over again, the level of the water in the air chamber and in the drive-pipe gradually rises until the water flows out through the upper end.

The purpose of the air chamber is to form a sort of cushion. Air is readily compressible, while water is not, and the air acts as a spring on the check-valve. Sometimes due to the air leaking out through the drive-pipe, the air chamber becomes water-bound. Most rams are made so as to prevent this by having what is called a little snifting valve in the drive-pipe, through which a small quantity of air is drawn in with the water. This is sufficient to renew the air supply in the air chamber.

This air chamber is not a vacuum chamber, nor is there a vacuum chamber on steam or power pumps. There is a chamber, however, which provides a cushioning effect and relieves the heavy direct strain of impact on the machine parts.

PULLETS PICK FEATHERS

Can you tell me what to do for pullets that pick feathers? When they get started they are even more ferocious in that they injure the skin badly, in some instances causing the injured bird to die. I feed cabbage, bran, dry mash and grain?—A. N., Clymer, N. Y.

The habit of pulling out and eating their own feathers or of other hens of the flock, is a habit which poultry acquires most frequently in the spring or at molting time. The first indication that the birds are pulling feathers is loss of plumage, bareness and redness of the skin on the posterior parts of the body. Sometimes the skin becomes broken by repeated pecking and sores result. If you watch the birds carefully you will notice they tear them out and very often swallow them. They are apparently very fond of the young

growing feathers, the quills of which are filled with blood.

Several causes have been assigned to this vice, the most probable being the lack of proper rations or insufficient exercise. No doubt in this case the habit became deep-rooted in the birds, and they have gone to extremes.

A good preventive measure is to give the birds an abundance of exercise. Make them scratch for a large part of their feed. In some instances lack of a sufficient portion of animal matter in the ration is responsible for the habit. Furthermore, feeding too long on grain will start the birds. This is easily counteracted by adopting a well-balanced ration containing skim milk, meat bone or green food along with a well-balanced grain ration.

Lard, Aloes and Vaseline

An application of lard or vaseline in a portion of aloes is a good ointment to apply. The disagreeable tastes of the aloes is thought to be responsible for curing the habit.

The birds should be carefully examined for lice and mites, and if these are found, insect powders should be obtained and applied. Plenty of grit should be on hand, as this may cause the lack of proper digestion. Sometimes a dose in the form of six or eight grains daily of a mixture of equal parts of powder, gentian root and ginger will prove beneficial. Isolate the injured birds as soon as an injury shows up.

WHEAT FOR FATTENING HOGS

I would like to know if wheat soaked in water is good for fattening hogs.—M. W.

Wheat is seldom fed to hogs except when the price is extremely low. According to several authorities, wheat should be selling in the neighborhood or less than 50 cents a bushel to make it really worth while to feed it to pigs. However, this statement should be qualified when damaged wheat or extremely high pork prices are considered.

The grain is relished by the hogs and makes rapid gains in producing hogs of extremely good quality. Tests at the Indiana Experiment Station have shown that wheat will exceed corn in rate of gain. During this same test it was discovered that soaked wheat gave a gain of 1.12 pounds, while unsoaked wheat alone was 1.05. Unsoaked wheat was avoided in greater percentage than soaked wheat.

The conclusion of the experiments was that whole wheat is fed at an unjustifiable loss, and that it is fed more economically when crushed or ground. By feeding hogs grain and skimmed milk, gains were increased 7 per cent. At the Missouri Station the following results were obtained: One bushel of wheat chop produced 13.2 pounds of pork; one bushel of wheat chop dried produced 12.6 pounds of pork; one pound of whole wheat produced 11.2 of pork.

CATTLE

Shall I Buy Stocks or Land?

Matters of Finance and Investment

AT the age of 43 I find myself possessed of about \$6,000 cash at present in savings banks and I own jointly with my brother, our farm, stock and equipment free from debt. I am unmarried—no dependents.

I should appreciate your advice as to investment of my money. Most of the conservative investment advice I read in the various magazines seems to be toward safe bonds or stock, but it has always seemed to me that this advice fails to take into consideration what I regard as very probable, that is—the cheapening of money as time goes on. For instance, a thousand dollar bond bought with money at its present value will be paid off in say twenty years with \$1,000 of cheap money worth only perhaps half as much.

Thus it seems to me that actual property is the thing to invest in—dwelling houses, for instance, except that at present they are only to be had at inflated war time prices—actual property that would depreciate in value as money cheapens. What do you think of this idea?

How do stocks behave as money cheapens? Do they go up in value or not?

I might say that I think your articles in the American Agriculturist are an interesting and valuable feature of the paper and I trust they will be continued.—H. L. H., New York.

What is the basis for your belief that twenty years hence money will be worth only half as much as it is to-day? Surely if that is the case it would be a mistake to invest in any bond or security the rate of return on which is fixed. However, as far as we are able to discover there is no justification for the theory that prices move continuously in one direction for, of course, what you mean when you say money will be cheaper is that prices will rise. It is only over a comparatively recent time that statistics are available covering fluctuations in commodity prices. The best summary for the period from 1810 to date is that prepared by the Harvard Economic Service, and this shows that except for the war periods the general tendency of prices was downward and not upward, as it would have to be if your theory was correct.

Back in 1812

Starting from the peak just after the War of 1812, prices declined with temporary interruptions until 1849, when gold discoveries in Australia and California increased production and inaugurated a period of rising prices. Then came the Civil War and currency inflation which raised prices enormously, but even so not quite to the peak reached in 1812. The following decline continued until 1897. You may remember that prices about that time were at the low, and this low was lower than at any time since the beginning of the century. Since 1897 there has been a very sharp rise, including the period when the high cost of living was so much talked about and culminating in the great inflation following the World War. Prices at the peak during this period were higher than ever before. Since that peak in 1920 there has been a decline. Now no one can predict the future, but, reasoning from the historical record, there is no ground for the belief that the trend will continuously be upward.

The Problem of all Investors

Coming down to your investment problem. If you buy bonds in a period of low prices such as prevailed in 1897, and they mature twenty years later, 1917, in a period of high prices, why obviously you lose. The \$1,000 you loaned in 1897 would buy more goods than the \$1,000 returned to you in 1917. Also, during that period each successive interest coupon would buy less in the market, but if you had bought a bond in 1877 which matured in 1897, you would have been the gainer. For the \$1,000 returned to you in 1897 would buy a great deal more than the \$1,000 you loaned twenty years previously. There is no way of avoiding this risk except by not having any money to invest. You will take it the opposite way if you invest in real estate, as you suggest. In periods of higher prices and periods of advancing prices the owner of stocks and the owner of real property benefits but conversely in periods of declining prices he suffers. There is also, as you know, risk involved in investment in real estate as in stocks. It is very difficult to select real estate

By G. T. HUGHES

which you are sure will be in a better relative position a year hence than it is to-day to say nothing of twenty years. And the investor in stocks takes a risk of unfavorable business developments generally and of unfavorable developments in the case of his particular company. These two risks are less in the case of seasoned and conservative bonds, in our judgment, than the case of some real estate and in most stocks. This is as near as we can come to answering your question.

TRY SOMETHING MORE CONSERVATIVE

The Archer-Daniels-Midland Co., with plants at Minneapolis, Toledo, Edgewater, N. J., Buffalo and Chicago offer some five million dollars of preferred 7 per cent stock at 98 and interest. Could you give me any information on this stock? Is \$100 in Central Mass. Light and Power 6 per cent convertible five-year bond series C due January 1, 1927 a good risk? Do you consider Pneumatic Scale Corporation (Mass.) 8 per cent First mortgage bond convertible into 8 per cent preferred stock a safe buy? This costs 105.—R. J. T., New York.

Archer-Daniels-Midland preferred stock is probably good but not high grade. The same is true of the other securities you name. For a small investor we think something more conservative is very much better. We suggest the preferred stock of the Standard Oil of New Jersey, listed on the New York Stock Exchange, selling about 117, paying \$7 annually, and so giving you a return of around 6 per cent. We are confident you will be better satisfied in the end to buy this stock.

* * *

Financial Department:—I have invested 500 shares in the New England Furniture Company, Minneapolis, Minn., at the rate of 8 per cent. Please let me know if this investment is safe?—A. R., Minneapolis.

The method adopted by this company to provide funds for its business is novel to say the least. As we understand it, they sell furniture on the installment plan and finance themselves by selling 8 per cent notes to individuals instead of by bank loans. As long as the company is financially prosperous we see no objection to the plan. You understand just what you are doing, you are not investing money in stocks or bonds, but are loaning money on a promissory note to a business firm. The strength of the investment depends entirely on the credit of the firm. Inasmuch as your residence is in the territory covered by this company you are in a position to keep yourself informed.

* * *

Financial Department:—Will you kindly advise, if the Colorado Fuel and Iron Sinking Fund 5%, due 1943, is a safe investment? I would also like your opinion of Wabash R. R. First or Second Gold Bond 5s, due 1939.—J. F. T., New York.

Earnings of the Colorado Fuel & Iron Company do not justify a high rating for the bond, which sells about 89. We would rather have a Hudson & Manhattan refunding 5 of 1957, which sells about 81. Nor do we regard the Wabash bonds as particularly desirable. The road manages to earn charges, but there is little left over. Instead of Wabash first 5s we suggest Southern Railway consolidated 5s selling about the same price, and instead of the second 5s we suggest Colorado & Southern 4½s of 1935.

* * *

Financial Department:—I hold a small block of shares of the Hydro United Tire Co. of Pottstown, Pa., who are in the hands of a receiver. The largest stockholders have formed a refinancing committee. They offer to give new stock for my old at \$5 per share, providing I buy the new stock for 50 per cent of the amount I now hold. Would you advise me to invest in order to save what I have? Can you tell me if Frishmouth stock is any good?—W. F. R., Pennsylvania.

Our advice is to put no more money into the tire enterprise. It would be better to rest content with the loss you already have than to take any more chances. Probably the tobacco stock you name has merit, but as the company does not issue a financial statement it is not easy to appraise the investment rating of its stock. We think it would be more conservative for you to leave it alone.

There's A Reason!

Why are all Moncrief Pipeless Users, Boosters? Because the furnace does deliver the best of service, distributing moist warm air to all corners of the house. It puts the dust and muss of the coal, wood and ashes down in the basement. It eliminates the unnecessary work of putting up and taking down of stoves. Everyone in the family is benefited by the comfort and convenience supplied by the Moncrief Pipeless Furnace. No cold, drafty floors in cold, windy weather with a Moncrief Pipeless Furnace.

for every risk the farmer takes there is a Hartford Policy

You may have a Policy—are you properly Insured?

MANY a farmer who says "I'm Insured"—simply means that he has a fire insurance policy. The policy is undoubtedly all right as far as it goes, but frequently it is inadequate because it does not give enough protection. That is the reason that the booklet—"MY PROPERTY", is of such importance, and why it will be sent without charge to owners and managers of farm property. Send for "MY PROPERTY"—it helps you determine property values and may save you a bad loss. Here is a coupon.

The Brown Mouse—By Herbert Quick

AND so it turned out quite as if it were in the old ballad, that "all in the merry month of May," there were great doings about the bold little promontory where once stood the cabin on the old wood-lot where the Simms family had dwelt. The brook ran about the promontory, and laid at its feet on three sides a carpet of blue-grass, amid clumps of trees and wild bushes.

But Old Man Simms was gone, with all the Simmses, now thoroughly established on the Blanchard farm, and quite happy in their new success. The cabin was gone, and in its place stood a pretty little bungalow, about which blossomed the lilacs, and peonies, and roses, and other old-fashioned flowers, planted there long ago by some pioneer woman, nourished back to thriftiness by old Mrs. Simms, and carefully preserved during the struggles with the builders of the bungalow by Mrs. Irwin. For this was Mrs. Irwin's new home. It was, in point of fact, the teacher's house or schoolmanse for the new consolidated Woodruff District, and the old Simms wood-lot was the glebe-land of the schoolmanse.

From the brow of the promontory, a light concrete bridge took the pretty little gorge in the leap of a single arch, and landed the eye at the bottom of the front yard of the schoolhouse. Thus the new institution of life was in full view of the schoolmanse veranda, and yet shut off from it by the dry moat of the brook and its tiny meadow of blue-grass.

Across the road was the creamery, with its businesslike unloading platform, and its addition in process of construction for the reception of the machinery for the cooperative laundry. Not far from the creamery, and also across the road, stood the blacksmith and wheelwright shop. Still farther down the stream were the barn, poultry house, pens, hutches and yards of the little farm—small, economically made, and unpretentious, as were all the buildings save the schoolhouse itself, which was builded for the future.

And even the schoolhouse, when one thinks of the uses to which it was to be put—kitchen, nursery, kindergarten, banquet-hall, theatre, moving-picture hall, class-rooms, manual training rooms, laboratory and counting-room and what-not, was wonderfully small—Colonel Woodruff said far too small—though it was necessarily so large as to be rather astonishing to the unexpectant passer-by.

THE unexpectant passer-by this May day, however, would have been especially struck by the number of motor-cars, buggies and surreys parked in the yard back of the creamery, along the roadside, and by the driveway running to the schoolhouse. People in numbers had arrived by five o'clock in the afternoon, and were still coming. They strolled about the place, examining the buildings and grounds, and talking with the blacksmith and the butter-maker, gradually drawing into the schoolhouse like a swarm of bees into a hive selected by the queen. None of them, however, went across the concrete bridge to the schoolmanse, save Mrs. Simms, who crossed, consulted with Mrs. Irwin about the shrubbery and flowers, and went back to Buddie and Jinnie, who were good children but natchally couldn't be trusted with so many other young ones withouten some watchin'.

"They're coming! They're coming!" This was the cry borne to the people in and about the schoolhouse by that Hans Hansen who would be called Hans Nilsen. Like a crew manning the rigging, or a crowd having its picture taken, the assemblage crystallized into forms determined by the chances of getting a glimpse of the bungalow across the ravine—on posts, fences, trees and hillocks. Still nobody went across the bridge, and when McGeehee Simms and Johnny Bonner strayed to the bridge-head, Mrs. Simms called them back by a minatory, "Buddy, what did I tell you? You come hyah!"

A motor-car came over the hillock, ran down the road to the driveway to the schoolmanse and drew up at the door. Out of it stepped Mrs. Woodruff and the colonel, their daughter, and Mr. Jim Irwin. Jennie was dressed in a very well-tailored traveling costume, and Jim in a moderately well-tailored business suit. Mrs. Irwin kissed her son and Jennie, and led the way into the house. Jennie and Jim followed—and when they went in, the crowd over across the ravine burst forth into a tremendous cheer, followed by a three-times-three and a tiger. The unexpectant passer-by would have been rather surprised at this, but we must all begin to have our suspicions. The fact that when they reached the threshold Jim picked Jennie up in his arms and carried her in, will enable any good detective to put one and one together and make a pair—which comes pretty near telling the story.

By this time it was nearly seven, and Calista Simms came across the charmed bridge as a despatch-bearer, saying that if Mr. Jim and Miss Jennie didn't mind, dinner would be served right soon. It was cooked about right, and the folks was gettin' right hungry—an' such a crowd! There were fifteen in the babies' room, and for a while they thought the youngest Hamm young one had swallowed a marble. She would tell 'em they would be right over; good-by.

The three elderly and the two young people emerged from the schoolmanse and took their way over the bridge to the school side of the velvet-bottomed moat. Then came a sudden rush into the big assembly-room, now filled with tables for the banquet—and here the domestic economy classes, with their

ably not quite fair for B. B. Hamm to incorporate in his wishes for the welfare and prosperity and so forth of Jim and Jennie that stale one about the troubles of life, but he wanted to see Jennie blush—which as a matter of fact he did; but she failed to grow quite so fiery red as did Jim. But B. B. was a good fellow, and a Trojan in his work for the cause, and the schoolmaster and superintendent of schools forgave him.

Colonel Woodruff made most of the above points which I have filched from him. He had begun as a reformer late in life, he said, but he would leave it to them if he hadn't worked at the trade steadily after enlistment. He had become a follower of Jim Irwin, because Jim's reform was like dragging the road in front of your own farm—it was reform right at home, and not at the county seat, or Des Moines, or Washington. He had followed Jim Irwin as he had followed Lincoln, and Grant, and Blaine, and McKinley—because Jim Irwin stood for more upward growth for the average American citizen than the colonel could see any prospect of getting from any other choice. And he was proud to live in a country like this, saved and promoted by the great men he had followed, and in a neighborhood served and promoted, if not quite saved, by Jim Irwin. And he was not so sure about its not being saved. Every man and nation had to be saved anew every so often, and the colonel believed that Jim Irwin's new kind of rural school is just as necessary to the salvation

"Isn't it fine to have the fireplace?" said Jennie.

"Yes, but we can't really afford to burn a fire in it—in Iowa," said Jim. "Fuel's too everlastingly scarce. If we use it much, the fagots and deadwood on our 'glebe-land' won't last long."

"If you should take that Oklahoma position," said Jennie, "we could afford to have open wood fires all the time."

"It's warmer in Oklahoma," said Jim, "and wood's more plentiful. Yes"—contemplatively—"we could, dear."

"It would be nice, wouldn't it?" said Jennie.

"All right," said Jim briskly, "get me my writing materials, and we'll accept. It's still open."

Jennie sat looking into the fire oblivious of the suggestion. She was smiling. Jim moved uneasily, and rose.

"Well," he said, "I believe I can better guess where mother would put those writing materials than you could, after all. I'll hunt them up."

AS he passed, Jennie took him by the hand and pulled him down on the arm of her chair.

"Jim," she said, "don't be mean to me! You know you wouldn't do such a wicked, wicked thing at this time as to leave the people here."

"All right," said Jim, "whatever you say is the law."

When Jennie spoke again things had taken place which caused her voice to emanate from Jim's shirt-front.

"Did you hear," said she, "what Angie Talcott asked?"

"M'h'm," said Jim.

"Well," said Jennie, "now that I'm married can I go on being county superintendent?"

There was a long silence.

"Would you like to?" asked Jim.

"Kind of," said Jennie; "if I knew enough about things to do anything worth while; but I'm afraid that by rising to my full height I shall always just fail to be able to see over anything."

"You've done more for the schools of the county," said Jim, "in the last year than any other county superintendent has ever done."

"And we shall need the money so like—so like the dickens," said Jennie.

"Oh, not so badly," laughed Jim, "except for the first year. I'll have this little farm paying as much as some quarter-sections when we get squared about. Why, we can make a living on this school farm, Jennie—or I'm not fit to be the head of the school."

There was another silence, during which Jennie took down her hair, and wound it around Jim's neck.

"It will settle itself soon one of these days anyhow," said he at last. "There's enough to do for both of us right here."

JIM walked to the open window and looked out over the still landscape. The untidy grounds appealed to him—there would be lessons in their improvement for both the children and the older people. It was all good. Across the pretty bridge lay the silent little campus with its twentieth-century temple facing its chief priest. It was all good, without and within. He went across the hall to bid his mother good night. She clung to him convulsively, and they had their own five minutes which arranged matters for these two silent natures on the new basis forever. Jennie was in white before the mantel when he returned, smiling at the inscription thereon.

"Why didn't you put it in Latin?" she inquired. "It would have had so much more distinction."

"I wanted it to have meaning instead," said Jim. "And besides, nobody who was at hand was quite sure how to turn the Latin phrase. Are you?"

Jennie learned forward with her elbows on her knees, and studied it.

"I believe I could," said she, "without any pony. But after all, I like it better as it is. I like everything, Jim—everything!"

"Let us cease thinking so much of agricultural education, and devote ourselves to educational agriculture. So will the nation be made strong."

THE END

THE BROAD HIGHWAY—By Jeffery Farnol

It Starts on This Page Next Week—Don't Lose a Single Number!

EVERYBODY has felt its lure—that open, friendly road that winds on out of sight and takes the venturesome traveler into who-knows-what perils and delights!

Jeffery Farnol's romance of the dashing young London lad cast by a turn of fortune's wheel to seek his fortune on "the broad highway" appeals to the gypsy in all of us. Whether he writes of stirring adventure or the placid, homey wayside life of country England, the author carries the reader along with him into every situation which confronts the likeable young hero.

This is a tale for all the family. Young and old alike will thrill to its incidents of chivalry, danger and romance. It starts next week. Don't miss an issue and save your copies, for it is a story you will want to read not once but many times over.

mothers, sisters, female cousins and aunts, met them, as waiters, hat-snatchers, hostesses, floor-managers and cooks, scoring the greatest triumph of history in the Woodruff District. For everything went off like clock-work, especially the victuals—and such victuals!

There was quantity in meats, breads, vegetables—and there was also savor. There was plenty, and there was style. Ask Mrs. Haakon Peterson, who yearned for culture, and had been afraid her children wouldn't get it if Yim Irwin taught them nothing but farming. She will tell you that the dinner—which so many thought of all the time as supper—was just as well served as if it had been in the Chamberlain Hotel in Des Moines, where she had stayed when she went with Haakon to the State convention.

WHY shouldn't it have been even better served? It was planned, cooked, served and eaten by people of intelligence and brains, in their own house, as a community affair, and in a community where, if any one should ask you, you are authorized to state that there's as much wealth to the acre as in any strictly farming spot between the two oceans, and where you are perfectly safe—financially—in dropping from a balloon in the dark of the moon, and paying a hundred and fifty dollars an acre for any farm you happen to land on. Why shouldn't things have been well done, when every one worked, not for money, but for the love of the doing, and the love of learning to do in the best way?

Some of these things came out in the speeches following the repast—and some other things, too. It was prob-

of this country as Lincoln's new kind of recognition of human rights was half a century ago. "I am about to close my speech," said the colonel, "and the small service I have been able to give to this nation. I went through the war, neighbors—and I am proud of it; but I've done more good in the peaceful service of the last three years than I did in four of fighting and campaigning. That's the way I feel about what we've done in Consolidated District Number One." (Vociferous and long-continued applause.)

"Oh, Colonel!" The voice of Angie Talcott rose from away back near the kitchen. "Can Jennie keep on bein' county superintendent, now she's married?"

A great guffaw of laughter reduced poor Angie to tears; and Jennie had to go over and comfort her. It was all right for her to ask that, and they ought not to laugh at Angie, so there! Jennie brought the smiles back to Angie's face, just in time to hear Jim tell the people amid louder cheers that he had been asked to go into the rural-school extension work in two States, and had been offered a fine salary in either place, but that he wasn't even considering these offers. And about that time, the children began to get sleepy and cross and naughty, and the women set in motion the agencies which moved the crowd homeward.

Before a bright wood fire—which they really didn't need, but how else was Jim's mother to show off the little fireplace?—sat Jim and Jennie. They had been together for a week now—this being their homecoming—and had only begun to get really happy.

What Kind of Tube Shall I Buy?

A Problem of the Amateur Radio Fan Answered

By BRAINARD FOOTE

THERE are so many vacuum tubes advertised for radio reception these days that the newcomer into the radio field is rather bewildered. Tubes are expensive, too, so that it is important to know just what tube is best suited for the particular receiving set with which it is to be used.

The type of receiving tube which is lighted from a dry battery instead of from the old storage battery is rapidly coming to the fore because of recent improvements in dry cell tube construction. Yet where great volume of speech and music is wanted, so that a loud speaker may be worked with sufficient strength to fill a large room or hall, the storage battery tubes are the only ones really suited.

But when it comes to a single tube receiving outfit, where the headphones are going to be used exclusively, the difference between the results obtained with the two types of tubes is so slight as to give rise to frequent argument among radio fans as to which is, in truth, superior.

"What is the best detector tube available to-day?" one may ask. Probably the UV-200, operated from a 6-volt storage battery, although the WD-11 and WD-12 tubes are for all practical purposes as good both for distance and strength of broadcasting received. Amplifier types of tubes are seldom quite as good detectors as the others, but with a higher "B" battery voltage very nearly equal them.

Now about amplifiers. Without question, the UV-201-A tube is without a peer in this class. Not only is it considerably better than its close relative, the UV-201, but it requires only one-fourth as much power to operate it as that tube. It is possible to run the UV-201-A from dry cells, although so many of them are necessary that the storage battery is cheaper in the long run. For instance, after we note that the 201-A tube takes one-quarter ampere at five volts to light its filament, we may realize that a series of four dry cells with the correct type of rheostat is sufficient for the tube's illumination.

But for a three-tube outfit, there would be at least eight batteries, and preferably twelve, in a series-multiple connection for efficient working of the set from dry batteries. That, of course, is a little too expensive for serious consideration, since a "recharge" would mean a new set of batteries at a cost of about \$4.80 after approximately 100 hours of service. A storage battery may be recharged at home with a battery charger at a cost of about a nickel, or at a service station for about 75 cents. The initial cost of the battery is in the neighborhood of \$16; yet a few recharges would turn the balance and show that the storage type is more economical.

For the second stage of amplification, with about 120 volts of "B" battery, the VT-2 or "E" tube is unusually satisfactory, and being larger in size than the other two storage battery tubes mentioned, operates the loud speaker with a shade truer reproduction.

Can amplification be accomplished by dry cell tubes? Yes, and with them a loud speaker may quite easily be made to function for a few people in a small room. The filaments of such tubes are so frail and thin, however, that the current which such tubes can send through the electro-magnets of a loud speaker is relatively small, and one cannot expect the greater output obtained with the other tubes just considered.

The same audio frequency amplifier circuit is used, with the exception that a "C" battery is always desirable to insure clear amplification. This consists

of a small flashlight battery inserted between the "F-" binding post of the audio amplifying transformer and the negative side of the filament battery, instead of the straight wire connection usually made between those two points. The little flat types of battery are just the thing, and they will last for five or six months, since practically no current is required of them.

In the first stage of amplification, a two-cell battery is O. K., while in the second stage, a three-cell unit should be selected. The long spring is the negative, and should be connected to the "F-" binding post. On some transformers, this post is labeled "S-2." The "C" battery may be made of separate small round cells connected end for end (in series) and in that case it should be pointed out that the brass cap in the center of the battery is the positive contact, while the zinc casing itself is the negative.

Perhaps the most talked of tube at this writing is the UV-199, a G. E. product. It is truly remarkable in several ways. The filament current is six one-hundredths of an ampere, or about one-seventeenth as much as is

taken by the old storage battery tubes. Three volts are needed, so that the tube can be operated for about seventy-five hours from a large-size three-cell flashlight battery. Three standard size dry batteries will do, and they will last just about 400 hours with one UV-199!

The UV-199 is not quite as good a detector as the WD-11 or WD-12 tubes, but it is far superior for radio frequency amplification, and in fact is very nearly the equal of the UV-201 or UV-201-A for that purpose. It is not quite as good as either of the other dry cell tubes for audio amplification, yet it can be used with considerable success.

For a single tube reflex circuit, described in the May 5 issue of the American Agriculturist, which is reproduced on this page, or for that circuit with an added step of audio frequency amplification, the UV-199 is just the thing. The tube is so good for radio frequency, that the range of a reflex circuit with it is greater than the same circuit where a WD-11 is used. Of course, the strength will not be quite as great on reception from a nearby station, but for farm radio work, where the unusual clarity available with a single tube and crystal detector in the reflex combination is appealing, the UV-199 should be chosen. Its "B" battery voltage should be about 45.

Since the various tubes mentioned are different in construction and in filament current, a special socket and rheostat are required, and one should be guided by the advice of the dealer or mail-order house where apparatus is purchased. Rheostats needed are as follows: UV-199, 30 ohms; WD-11, WD-12, 6 to 10 ohms; UV-201-A, 10 to 20 ohms; UV-200 and 201, 6 ohms. The WD-11 and WD-12 tubes are identical in build, although the latter employs a socket of standard design, whereas the terminals are differently arranged for the WD-11.

One may wonder whether or not it is permissible to arrange a combination of tubes, using each where it is best suited, and such a plan is certainly advisable and to be recommended. There might, for instance, be an ensemble where UV-199 tubes are used for the radio frequency part of an outfit, WD-11 tubes for the detector and first stage of amplification, and a UV-201-A for the second stage. Naturally, one must be careful with the "A" batteries in such schemes, so that no more voltage than is safe is applied to each tube. Separate "A" batteries are preferred for each set of tubes, although the same "B" battery may be used for all of them provided the negative side of all the filament circuits are connected together.

A. A. HOOK-UP WORKS FINE

I made the hook-up that you printed in the Agriculturist a few weeks ago and it works fine. I made mine in units and connected them together.

I find this hook-up works better without a grid leak or condenser. I also am using the Paragon control unit. I received the following stations using one WD-11 detector tube: WJZ, WOR, WEA, WAAM, WBS, WBAM, KDKA, WGY, WWJ, WDAP, WMAQ, WLW, WNAC, WGT, WOC, WSY, WHAS, WJAS, KOP, WBT.

My aerial consists of a single wire 75-feet long and 36 feet at one end and 25 feet at the other. This set tunes nearby stations out fine.

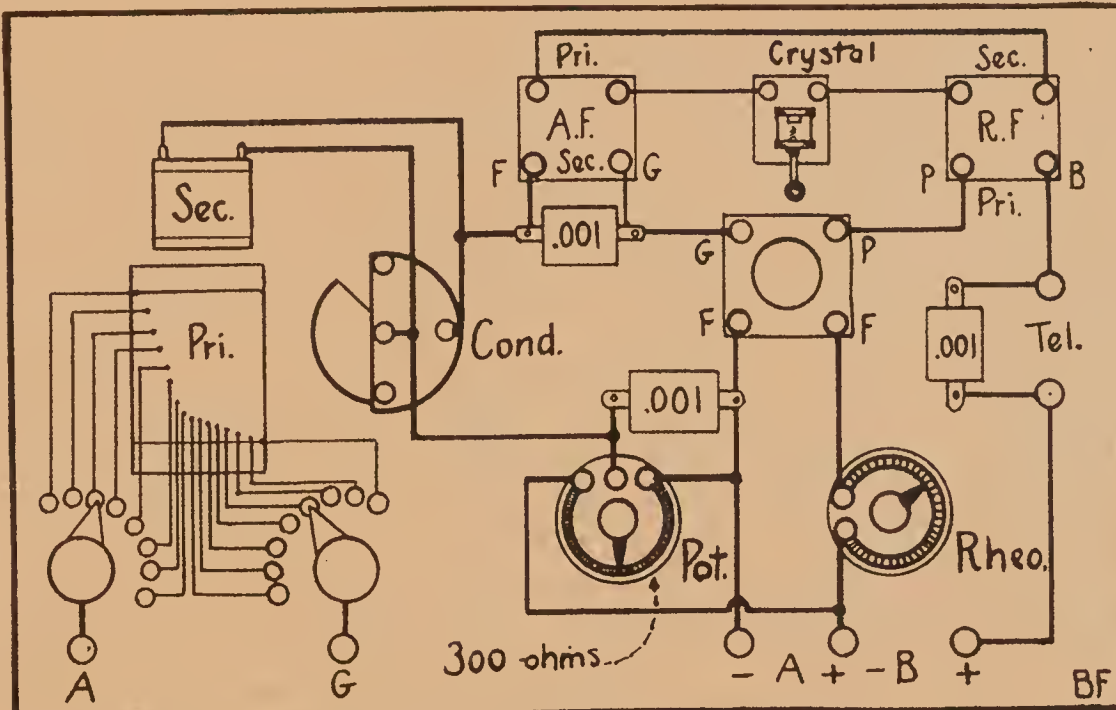

I hope other readers of your paper tried the hook-up.—LOUIS M. VAN NESS, Pompton, N. J.

SUBSTITUTE FOR WD-11'S

Please advise me, where I could buy a WD-11 vacuum tube as described in Mr. Foote's articles.—O. E. Williamson, Schoharie, N. Y.

If you cannot find a WD-11 tube, you may use one of the other types, such as UV-200, which is operated from a 6-volt storage battery or a new UV-201 A tube, which may be operated from such a battery or from four dry cells connected in series.

"I find the magazine so interesting I am subscribing for another year. No home should be without the American Agriculturist, city or country. There is always something to learn in the American Agriculturist."—Mrs. Wm. Wilkening, Jr., Windham, N. Y.

This is the layout or schematic diagram of the Reflex set, easily made and well adapted to distance reception

CANDY
PENNY A POUND PROFIT

3 POUND \$1 BOXES

Famous Loft candy direct by mail from New York City! Fresh, pure and delicious. Take advantage of our special 10-day offer to new customers:
Loft Chocolates: 1 lb. A rare treat for candy lovers. Each piece a joy to taste.
Peanut Brittle: 1 lb. Crisp, fresh and wholesome.
Old Fashioned Gum Drops: 1 lb. Fine jellied sweets of lemon, licorice and rose.
Send only \$1 for ALL THREE pounds. We prepay postage and guarantee satisfaction.

NEW LAMP BURNS .94% AIR

Beats Electric or Gas

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal oil).

The inventor, R. M. Johnson, 642 N. Broad St., Philadelphia, is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him to-day for full particulars. Also ask him to explain how you can get the agency, and without experience or money make \$250 to \$500 per month.

A Modern Bathroom, \$60

The "Pride"

Send for Catalog 40

Just one of our wonderful bargains. Set comprises a 4, 4 1/2 or 5 foot iron enameled roll rim bath tub; one 19 inch roll rim enameled flat-back lavatory, and a syphon action, wash-down water closet with porcelain tank and oak post hinge seat; all china index faucets, nickel-plated traps, and all nickel-plated heavy fittings. J. M. SEIDENBERG CO., Inc. 264 W. 24 St. Bet. 7th and 8th Aves. N. Y. C.

A Review of the Fashions For the New Season

Extra Patterns to Complete the Fall and Winter Wardrobe—A Question Answering Service

CLOTHES—and yet more clothes! The city stores are full of them; there are dozens of smart patterns for the home dressmaker to work on—but both the woman who sews and the woman who buys may be pardoned for feeling too confused to know just what is needed or what is best to get for the coming season.

The first thing to do is to take stock of what you have. Go over your closet and bureau drawers carefully. See what dresses can be furnished up by brushing and new trimmings, which will need more careful making over, and which must be discarded. Suits, coats, waists, and underclothes should have the same careful scrutiny; and don't forget shoes, gloves, and hats.

Then, when you know what you have on hand and where are the gaps in your wardrobe, you are prepared to go to work intelligently on your winter's outfit.

Though there are always vagaries in the style of a new season, the shopper who must spend her money to best advantage tries to choose clothes which, while they have the new lines, still are sufficiently conservative to last out the year and usually another year or more, without looking foolishly out of date. With the needs of the farm woman especially in mind, the fashion editor of the American Agriculturist has made a tour of the New York shops and the better mail-order houses and picked out the important features of the new fall and winter styles.

And here are the results of her researches:

Dresses.—One-piece dresses, of cloth or silk, are everywhere. It is a dress year—again. For cloth, twills are most popular, and navy blue and black continue to be the best colors. In silk, crêpe and satin predominate, a new satin, heavy but very soft, called charmeen, being the newest fabric.

The long straight lines continue—are even more so, in fact! Waistlines are still dropped; indeed, in many cases seem to have dropped quite out of sight, for dress after dress has no belt or waistline at all. It is the new princess line, but quite unlike the old close-fitting princess. These dresses are fitted in at the waist just a trifle—enough to take away the awkward "flour-sack" appearance. In many, the line is broken by side gathers, drapery, or a whirl of lace or self-material on the hip.

Trimmings are very simple, but sometimes extremely striking. The quiet effect of the dresses is often relieved by a touch of brilliancy in the trimming. Instead of the unrelieved neckline of last year, we now have collars again—but they are in odd shapes and sizes. Old cream laces of the heavy design type—not the finer filets—are seen both in real and imitation. The collars are not exactly bertha in shape, but often come very low on the dress. Some are in tab-shape, back and front, others combine several laces, including the still popular Irish.

One store is showing round collars in brilliant machine embroidery—blues, greens, and reds. Pleated frill ruffings, in black, cream and bright colors, are also much used. These vary in width from two to ten inches. One navy blue twill dress was trimmed all down the unbroken side closing, from shoulder to hem, with wide tan chiffon pleated ruffling. A red enamel buckle

at the waistline (or where it would be if slightly dropped) was the only other trimming.

In silk dresses, there is a little more variety, drappings, bustle effects, and pleated skirts for the new brown shade—*mordoné*—a leaf brown slightly darker than *suède*. Metallic trimmings are very usual. For more dressy wear, the Rembrandt green is popular.

Suits.—Though it is a "dress year," suits are very tempting. Tweeds are used in combinations and in plain colors. Fur seems a little less popular. Where it is used, it is used lavishly—on collar, coat hem, cuffs, skirt bands, and pockets—but many of the smarter suits have none. Rough fabrics of a "sport" type are very popular, especially in dark grays or two-toned weaves.

Coats.—Coat styles have changed more, perhaps, than any other. In design, they are much the same, but the fabrics are decidedly new. Huge checks, though not very bright in color, decorate coats of the polo type. Tans and light browns predominate. Also wide stripes are seen, going around instead of up and down. Because the two tones blend in well, these effects are not as startling as they sound; but the coats are decidedly noticeable and shown by all the good stores.

More dressy wraps are seen in battleship gray, *mordoné* brown, black, and blue; they are long, usually fur-trimmed, and have matching silk linings. Figured silks are seldom seen.

Blouses.—Outside blouses continue popular. They vary from severe white crêpe de chine to the most brilliant silks and metallic fabrics imaginable. Some have a touch of fur.

Hats.—Moderate sizes prevail, though the very large hat is here for dressy wear. Velvet for better use, suede or felt for "sport" or every day, are the accepted materials. Crowns are large and rather high; brims a trifle "poke." There are few toques or brimless hats. Some are gaily beaded or embroidered. The felts often are bound or trimmed with velvet and also use dashing quills and wings. Straight ostrich is almost universal on the better hats; it is usually in matching colors, but occasionally a shaded plume is seen. Many go closely around the crown; others droop off over the shoulder.

Shoes.—Very conservative styles are seen, as a reaction from the summer's orgy of red, green, and blue. Tan suede, in combination with leather, is much liked. All street shoes have moderate heels. The new browns are reflected in the materials. Stockings should match or be slightly lighter toned. "Freak" shoes seem entirely out—and few will miss them!

Accessories.—Since the dresses are so simple, beads and chains are running riot in color and number. Earrings, too, in spite of the rumor that their vogue had passed, seem more firmly "in" than ever, and have a wide variety of style, big and little. Handbags of pleated silk with jeweled clasps are smart, so are flat, very long, leather ones; beaded bags are still seen everywhere. Feathered bags for party use are very pretty, and there are still many fans, but they grow smaller now, instead of larger, each year.

Question Service for Readers.—If any American Agriculturist readers have questions to ask about their clothes problems (new or makeover), their letters will be personally answered by the fashion editor. Enclose a stamped, self-addressed envelope for your reply, and do not make your questions too general—that is, tell your coloring, what sort of use you wish the dress for, whether you are a young girl or an older woman, etc. This makes it easier for us to give you really practical advice.

A dark corner of a room can be brightened by placing a floor lamp so that it is reflected in a mirror. Also by purchasing hanging lamps with a good reflector on the back.—MABEL FERN MITCHELL.

YOUR FALL DRESS NEEDS ARE ANSWERED HERE

THE inside vest of No. 1877 gives opportunity for a becoming contrasting material. The sleeves may be short or seven-eighths length. Notice the smart waist finish.

No. 1877 is cut in sizes 16 years, 36, 38, 40, 42, 44 and 46 inches bust measure. Size 36 requires 2½ yards of 40-inch or 3 yards of 36-inch material. **Price 12c.**

1877

1865

No. 1865 is cut entirely from one straight piece of material, as the accompanying diagram shows. You have only to stitch up the underarm seams, finish the neck and sleeves, hem the skirt, and your frock is ready.

No. 1865 is cut in sizes 16 years, 36, 38, 40, 42 and 44 inches bust measure. Size 36 requires 3½ yards of 36-inch material for the short sleeve dress. **Price 12c.**

1881
Emb
666

No. 1881, a slip-on, closes on the left shoulder. It cuts in sizes 34, 36, 38, 40 and 42 inches bust measure. Size 36 requires 4¼ yards of 36-inch material. **Price 12c.** Embroidery Pattern No. 666, **12c extra.**

1873

No. 1873 shows the popular pleated ruffle trimming. The sleeves are perforated for shorter length.

No. 1873 comes in sizes 16 years, 36, 38, 40, 42 and 44 inches bust measure. Size 36 requires 4 yards of 36-inch material. **Price 12c.**

No. 1879 is a "One-Hour Dress," made from a single strip of material so that even a beginner can finish it in that time.

No. 1879 is cut in sizes 16 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 4 yards of 36-inch material. **Price 12c.** The Embroidery Pattern No. 654 costs **12c extra.**

No. 1868 is a coat and cap set for the child. The coat has kimono sleeves and is simple to make.

No. 1868 comes in sizes ½, 1, 2 and 3 years. The 2-year size requires 1½ yards of 54-inch material for coat and ¼ yard 36-inch or wider, with ¼-yard lining for the cap. **Price 12c.**

1879
Emb
654

ANOTHER version of the separate blouse is No. 1874. Notice the clever way in which the back laps over to the front. The sleeves may be long or short.

No. 1874 is cut in sizes 16 years, 36, 38, 40, 42 and 44 inches bust measure. Size 36 requires 1¾ yards 36-inch material. **Price 12c.** Embroidery Pattern No. 655, **12c extra.**

1874
Emb
655

WHATEVER the time of year, an apron is a necessity. No. 1883 is a new style, and easy to make, as the diagram shows. The front and back of the upper part is cut in one and closes at the sides.

No. 1883 is cut in sizes 36, 40 and 44 inches bust measure. Size 36 requires 2½ yards 36-inch material, with 5 yards edging. **Price 12c** (stamps preferred).

1883

1868

To Order: Write name, address, pattern numbers and sizes clearly; enclose correct amount; send to Pattern Department, American Agriculturist, 461 Fourth Avenue, New York City.

The new Fall and Winter Book of Fashions is a veritable treasure-trove for the woman who sews at home. It is full of attractive designs for all members of the family and has valuable general hints on sewing, too. **Price, 10c.**

A Story With a Moral

And Other Suggestions For the Home-keeper and Busy Mother

MRS. JONES comes over to my house and says: "Have you finished with your Agriculturist, and if so, could I take it? Mrs. Brown has borrowed mine and I'm almost sure John will ask for it this evening."

"I hope I'm not unneighborly," she says, "Mrs. Brown is a sweet little woman and I wouldn't hurt her feelings for the world, and I'm sure if she knew just how many annoying things crop up from that habit of borrowing the paper, she wouldn't do it. But it happens each week and I always think of something I would like to look over as soon as it's gone, and John always grumbles. Of course she's welcome to anything else."

Now Mrs. Jones is a fine woman and a good neighbor and I, too, would rather be guilty of an insincerity than a rudeness, so I tell her we are quite through with it and she is perfectly welcome.

The "head" comes in that evening and asks: "What is the date of that sale of Durocs?"

"I don't know," I tell him in a very small voice for I know what's coming. "Where's the American Agriculturist?"

"I loaned it to Mrs. Jones."

"Doesn't Jones take a farm paper?"

"She loaned theirs to Mrs. Brown," I answered, sagging a bit.

"Well, I hadn't read that paper," contributes another member of the family.

"I'll get it in the morning," I promise, apologetically, and the "other member" asks sarcastically if I think I can catch up with it, and I tell him, none too gently, not to be impertinent, and he goes out and slams the door.

Then I tell the "head" that I'll have the paper there to-morrow morning and he says "Humph" if nothing more. I think over Mrs. Jones' comment about the disagreeable things that can happen from one person's thoughtless habit of borrowing the paper, and the next morning I go to Mrs. Robinson's, half a mile up the valley, and borrow hers. —MRS. R. G. ARMSTRONG.

"BLOW HOT—BLOW COLD"—MOTHERS

Last evening I saw a six-year-old rush down the walk, to throw both arms about his mother, who was returning from a shopping trip; his face was aglow, his eyes shining with joy. Then I was dismayed to hear the mother say pettishly, as she pushed him aside, "For goodness sake, leave me alone. Can't you see that I'm tired, and have my arms full?"

No, a six-year-old doesn't often notice such things. I watched his bright face change, his lips quivering, and his eyes filling with tears.

Now, as it happened, a few days that same young mother was romping on the lawn with her boy and girl, and I had seen her end the game by gathering them both into her arms with passionate affection.

I know she really loves her children, but she is a "blow hot, blow cold," mother, who, when tired or nervous, treats her children with something almost like dislike; then, perhaps, the next day she bestows extravagant caresses upon them. Poor children, they never know what they are going to receive at the hands of their mother!

Punishing for a Trifle

I heard another mother of this same general type scolding her little daughter one day unsparingly for what—a tear in her glove! I wondered at her harshness, and was amused when the child looked up at her, and asked respectfully, "Mama, what would you have left to say if I stole something?" I wondered, too.

A week later the same child disobeyed a strict order of her mother's, and came tremblingly to tell me about it. I advised her to go to her mother at once and have it over with. She finally promised to, though she said, "I know Mama will whip me, for she said she would." A few days later I questioned her as to the outcome. She laughed, and said, "Oh, Mama was busy sewing, and she just said, 'Well,

you've been very naughty, and I'll certainly punish you if you do it again!'"

That is the mother who at one time pounces upon a child and punishes her for some mere trifle, and at another time overlooks a much more serious fault for which the child herself expects to be punished.

Are you a "blow hot, blow cold," mother whose children never know what to expect, or are you by your own poise, fairness, and self-control cultivating the same desirable qualities in them?—ETHEL G. PETERSON.

SEVEN ECONOMIES I HAVE LEARNED

1. To buy coffee in the green berry, and to buy these berries in large quantities. The berry keeps much longer than the bean, besides improving with age. Just before making my coffee, I roast and grind the berries and, in this way, get full benefit of the aroma and strength. Buying and making coffee this way is economical and, what is just as important, it tastes better.

2. To dry my celery leaves and use them as flavoring. Whenever I buy a bunch of celery, I clip off the leaves, dry them in the oven or in the sunlight, and, when they are completely free from moisture, run them through the meat grinder and place in tightly closed jars. It makes a spicy seasoning and doesn't cost a penny.

3. To save the water in which asparagus has been cooked. It makes an excellent soup when milk and seasoning is added and is worth keeping in the icebox over night.

4. To make my eggs do double duty. When eggs are high, as they usually are in cold weather, I make one egg do the work of two. I substitute a spoonful of cornstarch instead of one

egg, or else beat the white and yolk separately.

5. To grow parsley in pots instead of buying it at the store. I have three big pots of parsley in my kitchen, one in each window. It is ornamental and grows nicely.

6. Always to boil my potatoes, no matter how I serve them. In boiling potatoes I save my fingers from being discolored by peeling and also save more of the potato, for the peel, after a few minutes' boiling, can be removed skin-thick.

7. To use left-over ice cream. It may not look very appetizing in its melted stage, but when a little gelatine or tapioca is added, it makes a splendid pudding. This method saves both milk and flavoring.—I. R. HEGEL.

WASHING DISHES

Some weeks ago sickness made it necessary to get help of some sort for a short time, and a neighboring woman, who had a long tale of misfortune and bad luck, applied for the job.

At once she set to work to wash the accumulation of dishes. Without scraping a single dish or sorting or stacking them she went to work, with lukewarm water, a little soap and no hot water to rinse. At least fifty times she ran to the back yard to throw out a little coffee, some bread crusts, or a few scraps to attract flies, and every time the door banged. First a glass, then a frying pan, then a cup, and so on through the list. She would wash a few and then wring out the dishcloth and wipe them with it, though there were plenty of clean towels. It was her way and she could not get used to anything else.

Finally she had to go home and another woman came who had once been our hired girl. She is now the owner, with her husband, of a property valued at ten thousand dollars, and they have money in the bank besides. This they made by their own efforts during the last fifteen years, handicapped by illness and by the support of dependent relatives. She went quietly and efficiently to work to get everything in order and then washed and scalded the dishes, getting through in half the time. Everything else was done in the same orderly fashion and the house was soon reduced to order without slamming and banging.

And now we are wondering if the first family could not put a little order and system into their home, inside and out, and reduce the bad luck by half, as well as add to their happiness and success.—HOUSEWIFE.

STRAIGHT BACKS—LESS FATIGUE

Keep the back straight and do your work with less fatigue, is one suggestion made by home economists at the State College at Ithaca.

Nature's bending places are the hip joints and knees. If the strain is put on the back, undue fatigue will follow. In leaning somewhat forward, as in sweeping, in washing, in all kitchen-table work like kneading bread, rolling pie crust, preparing vegetables, and washing dishes, the movement should be from the hips, keeping the back in nearly the same position in which it is when one stands easily erect.

To avoid undue strain even when bending forward in the right way, kitchen tables, ironing boards, sinks, and washtubs should be made considerably higher than they usually are. Tables could be made to fit the women who work at them. If two women of different height must use the same table, it is much better for the shorter woman to reach somewhat upward than for the taller woman to stoop.

Lemons keep better if they're placed in a jar of cold water which is changed every 24 hours. They will keep for months packed in clean, dry salt.

* * * *

After the flour sack has been emptied open the bottom to remove a possible cupful.

THE two-in-one housedress is fashion's answer to the woman who would be ready both for hard work in her kitchen and for "inspection" if necessary. No. 1620 is as serviceable a pattern as we know. The one-piece housedress (the diagram shows its simplicity) is pretty and becoming. Designed for gingham, it may be made of warmer material if desired. The apron snaps on and pulls off in a second. Either pattern may be used independently of the other, yet you get them both for the price of one.

No. 1620 is cut in sizes 36, 40, and 44 inches bust measure. To make the dress and apron in the 36-inch size will require 2½ yards 36-inch material with 1½ yards 36-inch contrasting. Price, 12c. Address your order to Pattern Department, American Agriculturist, 461 Fourth Avenue, New York City.

Reviewing the Latest Eastern Markets and Prices

FALL APPLE PICKING BEGINS

HERSCHEL H. JONES

At various points in the Hudson Valley packing houses were opened last week and the first Greenings and other fall or early winter varieties received. Other packing houses will mostly be in operation by September 17. Some growers have already begun to pick McIntosh.

The New York market has been well supplied in last week with apples from Virginia, Delaware and Maryland, principally northwestern Greenings, Duchess, Wealthy, Stark, Gravensteins, and Wolf River, in bushel baskets.

The following were prices on State and Hudson River apples September 6, in bushel baskets:

VARIETY	BEST	ORDINARY
Wealthy	\$1.25@1.75	\$0.75@1.00
Gravenstein	1.25@1.50	0.75@1.00
Malden Blush	1.25@1.50	0.75@1.00
Alex. & Wolf River	1.25@1.75	0.75@1.00
Duchess	0.75@1.00

Barreled, A grade 2½-inch Alexander, Fall Pippin, Gravenstein, Maiden Blush, Wealthy and Wolf River sold at \$4@5. There were a few Hubbards in the market, which were picked too early, some Porters for which there is no demand, and a few McIntosh in baskets. No market is yet established on early McIntosh. It is expected that demand for them will be good by the middle of the month. The first McIntosh in the market last year sold at \$4@5, and they went up \$1.50 per bbl. around October 1. The first Greenings, A grade, 2½-inch, in barrels, brought \$4@5 per bbl., \$5 being the top price up till the last of October. At the present time it looks as though fancy A grade, 2¾-inch Greenings would bring about \$6 per bbl. at New York. Small to medium size Greenings are not in demand.

This is a year in which large size fruit is likely to bring a good premium, because of the small size of the bulk of the fruit.

POTATO MARKET DULL

Good weather for digging and a price of \$1.30 per bu. to the grower, compared with 60c per bu. at this time last year, brought a great many cars of Long Island potatoes into the New York City market last week. As a result, prices were easy and in the buyers' favor. Dealers found it hard to get \$4.25 per 150-lb sack, and the chain stores were buying them delivered to their doors in some cases for less than \$4. Generally, prices quoted f.o.b. Long Island loading points for carlot bulk, grocery stock, were from \$1.31@1.36 per bu., loaded; sacked, 150 lbs., \$3.40 @3.75. Farmers were not inclined to haul freely at offers of \$1.25 bu. Because of the Jewish holidays, many dealers believe the demand will be light and that prices will go lower.

Jersey round stock was offered freely in carlots at prices ranging from \$3@3.25 sack, 150 lbs., f.o.b.; Giants, \$1.90.

A few cars of Maine potatoes reached this market. Most of the buyers who inspected them reported that they were too "green" to bring good prices.

SHIPPING POINT INSPECTION

The New York State Department of Farms and Markets has just announced the expansion of its inspection and certification service on potatoes, which was started in an experimental way last season. A small appropriation by the last Legislature will make it possible to develop the shipping point inspection work in only a limited territory, and growers and shippers who are interested should make application at once to H. D. Phillips, State Department of Farms and Markets, Albany, N. Y. All over the United States, in the important potato shipping sections, governmental inspection service is being rapidly established because it eliminates a great amount of the risk for both buyers and shippers and is the most effective check on illegitimate rejections of shipments. Where inspections are made and certificates issued as to the quality and condition of a carload of potatoes at the time it is shipped there can be little ground for dispute as to its condition on arrival unless some unusual condition of transportation has caused deterioration in transit. Standardization of farm prod-

ucts, together with shipping point inspection, is the fundamental of better marketing. It is hoped that the service established by the Department of Farms and Markets will be made use of to the fullest possible degree by New York State potato shippers this year.

CABBAGE SHIPMENTS LIGHT

New York State had, up to September 1, shipped only 47 cars of cabbage compared with 154 to same date last year. In view of the light supply, there has been a fairly good market at New York. A few sales of bulk cabbage were made at \$50 per ton and fancy up to \$55.

BUTTER TRADE ACTIVE

Following Labor Day there was marked activity in the butter market with a considerable movement of stock to large buyers such as the chain

will be no exports into the United States such as affected the markets last year. The English market has likewise advanced sharply.

EGG PRICES ADVANCE RAPIDLY

Owing to light supplies of nearby hennerly white eggs last week, and small proportion of extra fancy full strong-bodied light yolk eggs, wholesale prices advanced rapidly on the higher grades. The top quotation on New Jersey, hennerly whites, closely selected extras on September 6 was 62c per doz., compared with 57c a week previous. Medium and mixed qualities, however, continued to move slowly at somewhat irregular prices. It is expected that the decreased demand at summer resorts will result in larger shipments to New York in the next week.

Average extras, nearby and nearby western hennerly whites went up to 51

even 31c per lb. White Leghorn fowls brought mostly 22@23c, with some large stock selling at 1c and 2c higher.

Express colored broilers were in liberal supply and fancy stock sold at around 28@29c. The bulk of receipts of Leghorn broilers moved at 26@27c, with 28c as an extreme price.

Rabbits were in demand at 25c per lb. Little trade for pigeons, which were quoted at 35c per pair. Ducks, express, sold as follows: Long Island spring, 30c lb.; other nearby, 24@25c; Muscovy, 14c.

LAMB MARKET IMPROVES

The lamb market which was somewhat lower the day after Labor Day, had improved by September 6, when supplies were cleaned up with prime lambs bringing mostly \$14.50@15. Six deckloads of Canadian lambs brought for the most part \$13.50. Sheep showed little change, prime ewes selling on September 6, for \$6.25@6.50.

The market on country dressed calves remained steady, most of the sales ranging from 12@18c. Under moderate trading live hogs brought on September 6, for light to medium \$9.90 @10.10.

HAY SUPPLY HEAVY

Hay buyers held off prior to Labor Day anticipating an accumulation of supplies. On Tuesday following there were 67 cars at the West 33rd Street yards with trading still quiet. The market remained steady, however, in the face of fairly heavy arrivals by both train and boat.

HONEY CROP LIGHT

The latest Federal report on honey confirms previous reports as to a light crop in the West and practically all over the country. The clover honey crop in northeastern States has been good, but buckwheat flow was cut short by cool weather in August.

Buckwheat honey extracted was freely offered in the New York market last week to jobbers and retailers at 10c and 10½c per pound.

Clover extracted from New York State is not in much demand yet and competition of California honey offered at 8@9c keeps the market down. The wholesale quotations on clover are 9@11c per pound, buckwheat 8@9c per pound at New York.

CASH GRAIN QUOTATIONS

Cash grain quotations September 7, were as follows:

NEW YORK: Wheat—No. 2 red, \$1.17½. Corn—No. 2 yellow, \$1.06½; No. 2 mixed, \$1.05½; No. 2 white, \$1.06½. Oats—No. 2 white, 51c; No. 3 white, 48½c; ordinary white clipped, 49@51c. CHICAGO: Wheat—No. 2 red, \$1.05½. Corn—No. 2 white, 88¾@89c; No. 2 yellow, 89¼@89¾c. Oats—No. 2 white, 39@41c; No. 3 white, 37½@39c. Barley—62@70c. Rye—71@72c.

Raising Healthy Calves

(Continued from page 179)

lined by Dr. Udall showed that feeding them in the beginning about 5 per cent of their body weight of milk he was able to gradually increase this up to about 12 per cent in the course of three weeks and to carry the calves along at a steady rate of growth.

Everything considered, my observation of Dr. Udall's work convinces me that he has the right system, particularly for calves of the Channel Island breeds, and I know of no better methods to use than those he outlined to me.

Appreciates Market Radio

I MUST say that I enjoy the market report which your station is broadcasting by the courtesy of the American Agriculturist. I was going to write for some market report blanks, but I couldn't catch the right address. So I thought the best I could do was to write and ask you kindly to ask the gentleman who reads the market report to send me some of these market report blanks to my enclosed address as I have understood him to say that he would gladly send to any one who asked for these above mentioned blanks free of charge. I would like to take the market prices down as you broadcast them from day to day.—T. D. V., Bergen Co., New Jersey.

stores. On Thursday September 6, the trading had slackened somewhat. Unsalted creamery with good supplies on hand sold slowly. On the Exchange Thursday, creamery extras brought 45c and a shipment of 87 score 40½c per pound.

Price advances in the European markets are tending to check imports. Nevertheless boats arrived during the week with cargoes of butter from Holland, Denmark, Ireland and Buenos Aires.

Stocks throughout the country are reported somewhat lower than last year and the condition for butter production rather favorable.

CHEESE MARKET IRREGULAR

The market on cheese was irregular throughout the week, but a number of dealers reported a better movement at satisfactory prices by September 6. Average run flats, fresh, were quoted at 25½c and fancy at 26@26½c per pound.

Canadian cheese markets are reported so high that it is expected there

@57c, compared with 48@51c of the week previous. A large proportion of receipts would class below "extras," selling in range of probably 44@49c per dozen. Nearby hennerly browns, grading as extras, sold at 44@52c.

Cold storage extra firsts are selling wholesale at 33@34c; Pacific Coast extra firsts, 44@47c. The outlook for profits on storage eggs is rather gloomy as the holdings in the four leading markets are still heavy and the August decrease this year was less than last year.

CHICKENS AND ROOSTERS

For the Hebrew Day of Atonement, which comes September 20, there will be an especial demand for chickens and roosters. These are used ceremonially to a considerable extent at this time, and lightweight birds are preferred. The best market days are September 17 and 18.

The demand last week was chiefly for fancy heavy fowls. Fancy express colored fowls sold mostly at around 28@29c, occasionally up to 30c, and

Quotations From Eastern Markets

The following are the prices at which farm products of special interest to eastern farmers sold on September 7:

Eggs, Nearbys (cents per dozen)			
New Jersey hennerly whites uncandled, extras...	60@62	Buffalo	Phila.
Other hennerly whites, extras...	58@60
Extra firsts...	48@50	45@47	38
Firsts...	44@47	34
Gathered, whites, first to extra firsts...	44@49
Lower grades...	35@42
Hennerly browns, extras...	47@50
Gathered browns and mixed colors, extras...	43@46	42@44
Pullets No. 1...	35@40
Butter (cents per pound)			
Creamery (salted) high score...	45½@46	48@49
Extra (92 score)...	45	46@47	46
State dairy (salted), finest...	44@44½	44@45
Good to prime...	41@43	36@42
Hay and Straw, Large Bales (per ton)			
Timothy No. 2	\$27@28	\$17@18	\$26@27
Timothy No. 3	24@25	22@23

"Save the Surface—And You Save All"

There Is Economy in the Use of Paint—Protect Farm Machinery Investment

DEPRECIATION of farm buildings is, to a large extent, due to decay or disintegration, something which can be almost entirely eliminated if proper preventative measures are taken. The well-known advertising slogan which has been appearing in recent years, "Save the surface and you save all," is especially true of wood and metal which enters into building construction.

There are all colors and kinds of paints. We have to have different colors of paints to satisfy not only personal preference but also for utilitarian reasons. It is necessary to have different

coats on new work, but it is much better to apply three. As much service can be gotten out of one three-coat application as out of two two-coat applications. The first or priming coat should contain considerable oil with little coloring matter. Subsequent coats should contain sufficient pigment to carry the color well and make an opaque coating. All the coats should be very thoroughly worked out. Several thin coats are much more durable than few thick ones.

The durability of paints depends to a large extent on their purity. The pro-

the bristles are exceptionally soft. To make these brushes, all the material you need is a small amount of wood, a few handfuls of hog bristles, a knife, some sandpaper, and a few feet of soft copper wire. The stick is first cut with one end forked. A small bunch of bristles is then inserted in the fork, at right angles to the stick, with the center of the bunch in the crotch of the fork. The ends of the fork are then bound together by wire. After this, the bristles are doubled together so that their ends are about the same length, and in this position bound with more copper wire. The ends are then clipped to make them even, and your brush is complete. The handle of the brush may be sandpapered, polished, and varnished if a finished job is desired.

PROTECT FARM MACHINERY INVESTMENT

CARL R. WOODWARD

How many farmers would leave \$25, \$50, and even \$100 in bills out in the open during an entire winter! Sounds absurd, but scores of such bills, in their equivalent of farm implements, are left in the shelter of broad skies all the year. Few farmers who follow this practice do so with a realization of the great loss they are sustaining on the money invested.

A hundred dollar machine left out of shelter over winter means a loss of from five to fifteen dollars. At this rate it is quite evident that a machinery shed would be paid for in two or three years, even at present building costs.

A suitable shelter having been provided it is essential to store the implements properly. If the shed has a dirt floor, keep machinery from resting directly on ground. Place a board at least under all supporting parts. In order to prevent rust, thoroughly cover all polished surfaces, such as plowshares, mold boards and cultivator shovels, mower knives and the like, with common axle grease. All adjusting screws and nuts should be thoroughly oiled with ordinary machine oil. Every wheel, hub and bearing, after a careful cleaning, should be packed with hard grease and replaced. Drills in which lime or fertilizer are used must be carefully cleaned, kerosene oil being liberally applied to all parts exposed to the fertilizer. Binder canvases should be hung up by wire to prevent damage from mice.

Liberal use of paint is the next step

A coat of paint in time and a shelter would have added years to their usefulness

kind of paints because the selection of the kind of paint has to be made according to the material to be painted and the conditions under which it must give service. For instance, the wear on a floor is much more severe than that on a wall, consequently floor paint must be tough, while resistant and elastic.

Whenever the weather is decent enough to work out of doors it is generally good enough weather in which to do painting. However, when it gets very cold painting should not be done and the paint will not flow well, and not only will it be necessary to use more paint but that which is applied cannot be worked into the thin, quick-drying layer that is necessary for durability. It is also true that sometimes the surfaces of boards become so warm in the summertime, especially when they are exposed to the direct rays of the sun, that the paint will boil or blister. It is well to follow the old rule laid down by practical painters, "In the spring and fall follow the sun, in the summer follow the shade."

Dry Surface for Best Results

Anyone can see that for the best results surfaces to be painted should be perfectly dry. This is especially true of wood. If the wood is wet or damp and paint is applied over the surface, moisture will be imprisoned within the wood and will be likely to cause its deterioration. In addition to this, should the surface become warm after the paint is applied, the moisture will expand and cause blistering of the paint surface. When metal surfaces are to be painted they should be perfectly dry and clean. Galvanized iron often has a greasy film which should be removed with soap and water before paint is applied.

Surfaces to be painted should also be worked down as smooth and clean as possible, for the smoother the surface the less paint will be needed and the less will be the wear on the brushes. In painting new wood, knots and sap spots should be given a coat of shellac. This is to imprison the extra pitch held in these places and to give a surface to which the paint will more readily adhere. Old work should be scraped down or burned clean with a torch so that all blisters, scales and rough places are thoroughly removed. Even on work that appears to be fairly smooth it is well to go over the surface with a stiff wire brush, following by a thorough sandpapering.

The general practice is to apply two

fessional painter may be able to mix his own paints very satisfactorily, but it is doubtful if the individual user, who buys paints in comparatively small quantities, can do this to any degree of profit. It would be better for him to buy ready-mixed paints from a good dealer who handles reliable, well-advertised brands. If necessary to thin paints, only pure linseed oil or turpentine should be used.

In going over surfaces that have been previously painted, combine common sense and elbow grease with paint. Should the old paint be in fairly good condition, but be marked with thin, hard lines which appear only on the surface, it is an indication that more oil is needed. The first new coat should be thinned with equal parts of oil, linseed oil and turpentine so as to give elasticity and life to the under coat. If scaling or powdering has occurred to any extent, then complete removal of

Farm implements represent a heavy investment. With the harvest over, that investment should be protected with paint and shelter

the old paint is the most satisfying procedure. Sometimes on old work there are small spots which, due to some peculiarity of the wood, often do not hold the paint well. These should be very carefully scraped down and touched up with a thin coat of paint thinned with turpentine.

MAKE YOUR OWN BRUSHES

R. S. CLARY

Small brushes can be made at home, either for pleasure or for profit, with very little trouble and expense. They can be used for many purposes, for anything from painting to shaving, if

in keeping machinery in the best condition. Of course all parts must be freed from dirt and grease. Then paint the wood with a good grade of paint pigment mixed with linseed oil. All metal parts, except those greased, must be well covered with the best metal paint.

When the cleaning, greasing and painting is being done, one can also make note of each broken or worn part that needs to be replaced. These can be secured during the winter, and when the spring and summer work calls for the various implements, they will be ready for duty. How much more satisfactory than to be compelled to sacrifice a day or more for repairing at a time when the machine is needed most.

This desk drawer has a pen and pencil groove, an ink well receptacle and an ink well. The lid is removable so that writing supplies, etc., can be kept in the drawer. This special feature makes the table serve a double purpose—a library table and a desk. The desk drawer measures 18 inches x 15 1/4 inches.

30th Anniversary Sale

Thirty years ago in a little store here in Pittsburgh this business made its humble beginning. With small capital but great faith I staked my all on the downright honesty of the average man and woman, the people who deserved credit but found it hard to get. I was a pioneer in the "open account way" of home furnishing. My little business has since grown into a mammoth institution that performs a nation-wide service. To celebrate my thirtieth anniversary I am conducting a Big Sale that will last throughout the year.

Big FREE BOOK

All my prices are Low — much lower than Spot Cash Prices in your home town stores. Everything I sell is sent on 30 Days' Free Trial and Use in Your Own Home, and I give the Longest Time to Pay. I repeat to you what I said to my first customer 30 Years ago: "I Will Trust You Gladly." Send for my Big Free Catalog today. See the thousands of Bargain Opportunities that await you. Learn how easy it is to get now the things you have long yearned for on terms so low that you will never feel the outlay.

Wonderful Bargains

Be sure to write for my Big Free 30th Anniversary Bargain Book Today. It shows Astonishing Bargains in Furniture, Bedding, Springs, Mattresses, Bed Spreads, Rugs, Carpets, Linoleum, Lace Curtains, Portieres, Dishes, Baby Carriages, Glassware, Stoves, Ranges, Lamps, Enamel Cooking Sets, Aluminum Ware, Refrigerators, Washing Machines, Sewing Machines, Table Linen, Guns, Silverware, Clocks, Cameras, Phonographs, Bicycles, Children's Automobiles, Wagons, etc.

Community Plan in Rural School Bill

No Forced Consolidation—More Local Control—Equal Opportunity

IN accordance with our promise in last week's issue, we are giving here the first of a series of articles about the New York State Rural School Bill. It will be remembered that this bill, containing the suggestions for rural school improvement made by the Committee of Twenty-one after a long study, was introduced into the New York State Legislature last year, passed by the Senate and laid over in the Assembly. It will without doubt come up again for consideration this year and, therefore, these articles are written in order that our people may have a clear understanding of just what is proposed in this law and what may be expected from its operation if it is passed. As there is much misunderstanding about the bill, due largely to the fact that a large amount of misinformation has been purposely published about it, we hope that every farm family will reserve their decision and remain open-minded until they have taken every opportunity of studying the bill and learning all of the facts in regard to it. The vital interests of generations of farm children are involved.

In a later article we will discuss how the Committee of Twenty-one was organized, who was in it and how they were appointed, and the methods by which they arrived at their suggestions and recommendations for the rural schools. But after all, the committee itself is of minor interest. What farmers are chiefly interested in is the main provisions of the bill and how these provisions will work if the bill passes.

How the Community Unit Would Work

The most important provision of the bill is for a community district for school administration. This is defined as follows in the bill: "A community district shall, so far as may be, comprise school districts which are connected by lines of transportation or are related by social, commercial or other similar conditions and which are grouped around some center of population, trade or social life." In the formation of these community districts no attention would be paid to town and county boundaries, but such factors as topography, roads, electric lines, railroads and existing trade and social centers would be considered.

These community units would be established or laid out in each county by a local temporary commission appointed by the board of supervisors. This commission would consist of four members, two of whom must be from the rural districts and two from the villages. The county commission is only temporary and would go out of business as soon as it had established the boundaries of the community units. When establishing the community units, the commission would hold hearings in communities affected.

Each community unit or district would be governed by a board of education. This board must contain at least one member from each school district in the community district. Members of the board would be elected at the annual meetings held in the different districts in the community unit. The duties of the community board of education are practically the same as those now had by trustees and boards of education of common and union free school districts.

Now get this next point, because it is the one that is most misunderstood. If this bill

should pass, *not a single rural school could be consolidated with any other unless a majority of the people in that district voted for such consolidation.*

Furthermore, no one not a resident of your own local district could vote or have any power to consolidate or not consolidate your own district. All of this talk about transportation of pupils long distances over winter roads has no point so far as this bill is concerned because if your district did not want to consolidate and have such transportation, it could not be forced to by any outside influence.

A majority of those who recommended the Rural Education Bill are farm people. They fully recognize that there are districts in New York State so situated because of weather, roads and mountains, that transportation during the winter months of small

that education if they wish it. They do not have such opportunity now.

One of the chief reasons why the older children so often tire of school is that there are usually only a very few of them in the upper grades of the district school, almost all of their associations are with the younger kids, and they become bored, dissatisfied and get the notion that education is a sort of "sissy" business, good only for small children.

In the way of administration, the Rural School Bill provides also for an intermediate district, which corresponds approximately to the territory now under the control of the district superintendent. The intermediate district will consist of several community districts and also will be under the control of a board of education. This intermediate board will consist of one member from each community district within the intermediate district,

to be appointed from the community board from among its members. The board of education of the intermediate district will elect the district superintendent and he will be responsible to them. This board also has certain other minor duties which will be discussed later.

Under the present law, the district superintendent is chosen by school directors, who are elected by the people at the general elections. These directors have no control whatever over the superintendent. He is responsible to the State department of education. Under the new law, the people themselves are given much more local control through the district superintendent being directly responsible to the intermediate board of education.

Next week we will discuss in detail, with examples, how the Rural School Bill will affect the farmers' school taxes, and will show how this bill will actually

give better rural schools at lower taxes than a majority of farm people obtain now.

We will run also a series of questions and answers on important points in the bill. If you have some question that you would like answered, feel free to write us and we will answer it to the best of our ability. We also have obtained a supply of pamphlets explaining and discussing the Rural School Bill. We will be glad to furnish these free upon request as long as they last.

Going to Dairy Show

Special excursion trains are being planned on all of the different roads to carry the host of farmers and dairymen to the National Dairy Show at Syracuse, October 5 to 13. On October 10 special trains from many of the cities in southern Pennsylvania will carry the members of the Dairymen's Cooperative Sales Company and the Pittsburgh District Dairy Council. Other trains will arrive from Philadelphia and Harrisburg with farmers of the Interstate Milk Producers Association. Special automobile tours from northern New York counties, Erie County, New York, and McKean County, Pennsylvania, and other sections will carry delegations to the great exposition.

* * *

At a recent Guernsey Field Day in Susquehanna County, Pennsylvania, two-thirds of the men present signified their intention of attending the show. Wayne, Bucks and Blair Counties of Pennsylvania are all planning big delegations.

Which Is Better?

UNDER the present New York State Rural School Law, the district superintendent of schools can, if he wishes, dissolve any district or districts in his jurisdiction and combine or consolidate them with other districts. This consolidation can be and has been made without the consent of the school patrons affected. Their only redress is an appeal to the State Commissioner of Education.

On the other hand the proposed Rural School Bill reads as follows: "After this act takes effect, such districts (common school districts and union free school districts having less than 4,500 population) shall not be dissolved or their territory annexed to other districts without the consent of the qualified electors (voters) of the districts expressed as prescribed in this act."

In other words, under the present law, your district school can be taken away from you without your consent. Under the new law, this would be absolutely impossible. This article on consolidation in the new Rural School Bill is only one of many ways by which the farmers on the Committee of Twenty-one provided for more local control in their recommendations for better rural schools.—The Editors.

children would be difficult if not impossible. Those who best know whether consolidation is practical are those who would be affected by it; that is, those who live in the districts to be consolidated.

The bill does provide for a larger unit of administration. On the board of education of this unit every district must be represented by an elected member, but even this elected board has no power to consolidate any of the districts in the community unit. On the other hand, any district may keep its local school open and still have the privilege, if it wishes, of sending the older boys and girls to high school without paying tuition.

For Equal Opportunity

One of the gravest educational injustices to farm children in America is the old plan whereby those older boys and girls who live in villages and cities can easily obtain a high-school education free of charge, while thousands of country boys and girls must go without it because they or their parents are unable to pay the tuition and other extra charges.

One of the best things about the proposed bill is the equalization of educational opportunity. Under this bill you can, if you wish, keep your small children near at home in the district school and without extra cost, give the older boys and girls, whom the local school can no longer help, a high-school education free of charge. Whether or not you believe in more than a common school education for your children, you certainly will agree that your children ought to have the same opportunity as all others in obtaining

A Vital Influence in the Successful Use of Illumination in the Poultry House

By F. L. FAIRBANKS

THE effect of artificial illumination on poultry was observed some thirty-three years ago and like all discoveries was given little attention at the time, but during the past ten years progressive poultrymen have dared to try out artificial lighting and the agricultural colleges in the United States and Canada have carried on extensive experiments which have proved that the judicious use of artificial light does increase the winter egg production, that the use of lights for this purpose is profitable and that no ill effects are produced on the birds.

This may seem a sweeping statement, but all the great mass of evidence which has been obtained by extensive experimentation proves that the use of lights alone will not produce desirable results, but that the proper care and feeding methods combined with the use of lights produces greater egg production during the winter or short day season.

It is sometimes erroneously assumed that the use of lights causes the birds to produce more eggs per year. The number of eggs per year that the bird produces depends on other things, one of which is the breeding. The real benefit from the use of lights is to lengthen the working day during the high-price egg period, and to get a more uniform production during the laying period of the bird. This better distributes the labor of caring for the flock and due to the variation in the price of eggs makes it possible to maintain the flock through the winter at a profit.

The factors of the length of day to give the birds and the feeding practice under artificial light have been pretty well determined and information on this is available at all the agricultural colleges, but the factor of the intensity of light in the pen to produce results had not been given serious attention until the New York State College of Agriculture at Ithaca commenced investigations some two years ago to determine if possible, first, the intensity of light on the floor of the poultry house which would enable the birds to see and pick up the grain readily and second, the most economical means of securing this intensity.

The arrangement of the test pen is shown in Figure 1. Two lines of stakes at right angles were set along the floor the zero point of each line directly under the light. Many different reflectors, sizes of lamp and heights from the floor were used and in each case the intensity of light on the floor at each stake was measured by a foot-candle meter. In this way charts of the floor intensity were obtained. Then the birds were allowed to

Figure 1. With a shallow reflector, the more desirable, the light goes directly to the birds on the perches, causing them to come down and feed

work under these different combinations of lamp, reflector and height from the floor, until it was determined that below a certain intensity the birds feed slowly or as it was termed, the birds were inactive. The activity increased up to a certain intensity and above this intensity no increase in activity was obtained. This intensity for active feeding was from eight-tenths to one foot-candle.

It was also found that other factors than the intensity of light on the floor had a very noticeable effect on the activity of the flock. One of these factors was the general illumination of the pen and by general illumination is meant the intensity of light on the floor, the walls, the perches and the ceiling.

Please for a moment consider how the break of day rouses the birds. As the daylight increases it floods the perches and the

floor with light. The walls above the perches and the ceiling are of course illuminated. But the point is that the light comes directly to the birds eyes. The bird does not look above the light, it looks into it and down to the ground under it where the food is found.

The conditions with artificial light are somewhat the same. The arrangement in Figure 1 is such that the light goes directly to the birds on the perches and causes them all to come down to feed. The arrangement in Figure 2 does not permit direct light to

strike the perches and it was found by repeated trial that some of the birds tended to stay on the perches. These two examples also show a difference in feeding area with the same size of lamp, Figure 1 giving the greater feeding area with the same expenditure of electric energy.

A great number of interesting facts were observed in these experiments, but it is not possible to discuss them fully here, however the outstanding features are:

1. An intensity of light of from eight-tenths to one foot-candle is the intensity which permits active feeding.

2. The perches should have direct light from the lamp so that all the birds will come down to feed.

3. The economical lamp which will give this intensity is a forty watt Mazda.

4. The reflector which gives the widest workable distribution

is cone shaped, sixteen inches in diameter by four inches high, the reflecting surface being aluminum bronze.

5. White-wash on the walls and ceiling have a decidedly detrimental effect with the use of artificial light.

6. The general rule for finding the number of lighting units, (one 40-watt Mazda lamp with 16 by 4-inch reflector,) for a given size of pen, is to divide the number of square feet of floor space by 200. The nearest whole number will be the number of lamps required.

7. Locate these units six feet from the floor, ten feet apart and along a line midway between the front of the house and the front of the dropping board.

8. Where a long house is divided into

A Right Verdict After the True Facts

ON Page 190, we are printing the first of the series of discussions on the New York State Rural School Bill. We hope you will find time to read and study these articles because there is so much at stake. We hope also that you will feel free to ask any questions about points which you do not understand. During the past year we have talked with thousands of farmers at meetings and we have had hundreds of letters about the principles in this proposed Rural School Bill. From this experience, we unhesitatingly say that farm people who understand the principles in this bill are for them.

Anyway, if after these principles are well understood a majority of the people of the State are opposed to them they, of course, should not become a law. So both those who oppose the bill and those who are for it are agreed upon one thing, and that is, that there should be every effort made to get correct understanding of the principles involved before you. The final verdict must be and should be in your own hands.

Storing Heat

WITH the approach of another winter of fuel shortage, farmers will be urged to conserve coal by burning wood. This is dangerous advice. It is all right to cut down the trees and burn the wood that will grow no more, but the rapid destruction of the forests is a calamity to this country and not even a fuel shortage is an excuse for destroying the comparatively few remaining growing trees.

It would seem as if the farmers' fight with the weather gets worse every year. If this is true, one of the chief reasons for it is the loss of our good friends, the trees. Most sections of the East have had terrible droughts this summer, causing farmers losses that run into hundreds of thousands of dollars. More woods would have prevented much of this loss by holding the moisture in the ground.

Some day in the future people will laugh at our helplessness in obtaining fuel. We

heard a farmer say the other day that it will be a good thing when the coal all disappears because then necessity will force men to get the stored heat of the sun through some other much cheaper and easier way. For instance, there is enough water power in nearly every eastern State to furnish by electricity all the fuel needs of man; and there is heat enough from the direct rays of the sun wasted every summer on a single acre to keep all the inhabitants of the whole town warm all winter. All that is necessary is to find some means of catching it and storing it up for future use. Man has accomplished just as difficult tasks as this, and when necessity forces him to, he will harness the sun easily and cheaply to drive his factories and transportation, and warm his home.

"The Broad Highway"

NOTHING has given us more pleasure in some time than when we found that we were able to secure "The Broad Highway" by Jeffery Farnol, to publish as a serial in American Agriculturist. Some years ago we accidentally ran across one of Farnol's books. We read it and hurried back to the library for more and Mrs. Eastman was able to get very little work out of us at home until we had finished everything that we could find that Farnol had ever written. Of the several fine stories that he has written, "The Broad Highway" is easily the best. Its very name will make every country-bred person want to read it.

Our requirements for fiction in American Agriculturist are very exacting, for we believe our people should have the very best in English, style and interest. But "The Broad Highway" more than meets all of these requirements and is in our opinion the best story we have been able to give you yet. The first installment is in this issue.

Milk Prices Improving

AS announced on Page 196, the Dairymen's League Cooperative Association net pool price for August is \$2.085. The August price is 33 cents greater than the pool price for August price last year. It is the highest August pool price ever paid by the Cooperative Association.

Of course, some of this better price is due to the usual seasonal increase; some of it is due also to the bad conditions that have prevailed on the dairy farm during the past summer. But most of it is a result of good organization. There has been no real shortage of milk this summer, in spite of the fact that pastures in some sections have been dry. There has been a fairly good market, and dairymen have been able to take advantage of good market conditions because they were organized. Another factor to be given credit is the fact that there has been a slow but constant gain by the association in transferring milk from the lower price classes to Classes 1 and 2, thus raising the net pool price to farmers. In this connection it is significant to note that the fluid price paid by dealers for milk in August, 1922 was \$2.90, whereas the fluid price for August, 1923 milk was \$2.43 for the first half of the month and \$2.73 for the last half or an average of \$2.58. In other words, although the price paid the association by dealers for Class 2 milk during this August was 32 cents less than August a year ago, the net pool price realized by the farmers is 33 cents higher.

The Eastern States Association, composed of several independent cooperative creameries also reports improving milk prices, indicating good work done for its members. We get the same story from the New England Milk Producers' Association with headquarters at Boston and from the Interstate Milk Producers' Association at Philadelphia.

There is, of course, much to be done by all of these dairy marketing organizations, of which the League is the largest, but for two years now milk prices have been higher than almost any other farm product, and without doubt the chief reason is that the dairymen are better organized than other farmers to market their products in a business way.

An Education In a Week

FOR the dairyman interested in learning a lot about his business in a short time, the World's Dairy Congress and National Dairy Show to be held in Syracuse from October 5 to 13 offer the opportunity of a lifetime. Never in the history of the dairy industry have there been so many people in one place interested in dairying and so many dairy exhibits as will be gathered in Syracuse at the World's Dairy Congress.

There will be representatives and exhibits from all the States of the Union and from thirty-nine other countries. In the program there will be addresses and papers on dairy research education given by teachers, investigators, officials and engineers interested in the solution of dairy problems. Men engaged in breeding dairy cattle and in producing, manufacturing, exporting, importing, storing and distributing dairy products and equipment will deliver addresses. State, national, municipal and private officials concerned with milk standards, adulterations, sanitation and animal disease control will be on the program and there will also be talks by representatives of consumers interested in the milk consumption problem, such as public health and nutrition workers, philanthropists, social welfare workers and students of the influence of the diet on the health and vigor of all nations.

Farmers will be particularly interested in the many discussions planned on cooperative milk organizations and in the discussions of prices of milk and costs of production. The program will contain discussions also on the use of all kinds of dairy machinery such as the milking machine and separator. Cattle breeders will discuss their many problems and particular attention will be devoted to the diseases of cattle and their control.

One of the many dangers of a great convention of this kind is to prepare too much for the needs of the big breeders and dairymen whose problems are not always the same as those of the average farmer. The National Dairy Show has taken particular pains in its exhibit and program this year to prepare to entertain and help the average man with only ten or twelve cows.

Substantial reductions in railroad fares to Syracuse have been obtained for this show. Round trips to the exposition will be a fare and a half for all over the United States and Canada. Hotel accommodations should be obtained immediately.

The Woman Who Did What She Could

ALL of our people who read Mr. Van Wagenen's rather pathetic story entitled, "The Woman Who Did What She Could" will be very sorry to know that this same woman was recently very seriously injured by an automobile. While crossing the State road at night in front of her home, she was struck by a car which fled on in the night without stopping. She lay for many hours unconscious, but now is in a fair way to recover. Mr. Van Wagenen writes: "I thought you would be interested in knowing how tragedy seems to follow 'The woman who did what she could.'"

Have you arranged for signs for your autos? Let the world know you are going to the Dairy Show, and where you are from.

Solving the Farmer's Health Problem

A WEA F and American Agriculturist Wednesday Evening Radio Message

CURIOSLY enough there seems to be a deep-rooted belief in the minds of most people that living in the country is sufficient to insure good health, and yet no public health problem of the State has been so difficult to solve as that of rural health conditions. The average city dweller has no realization of the hardships that may come to a farmer's family in the winter months, when roads are clogged and illness visits a family located sometimes many miles from the nearest open highway. Babies are born, contagious diseases find their way into the family, pneumonia occurs, and almost any kind of suffering known to the human race finds its way somehow to the farm as easily as it does elsewhere.

Our State Health Department has made very careful studies of these conditions and tragic as well as pathetic stories come to their attention over and over again. One of them I remember impressed me very deeply. A doctor reached a family living in the country after two and one-half days of endeavor to get someone to go there. He found a very sick mother with a new-born child and three older children, one of whom was dead of scarlet fever and the other two far gone with its ravages, and the father so ill with pneumonia that his life, too, was despaired of.

Supporting physicians and nurses in these rural communities is one of the great difficulties. Statistics show clearly that young men are not going into the country districts to practice, in nearly sufficient numbers to care for the population. There is little to attract them in this type of practice. Long distances to cover, caused by widely scattered homes, no opportunity for experimentation or hospital work, a dwindling population and in the winter months roads over which traveling is most difficult, if not entirely impassable the greater part of the time, constitute some of the obstacles. Naturally statistics show mortality rates in these districts, that are in keeping with conditions. Figures gathered by the State Department of Health out of fifty-seven counties, twenty-one individually show a higher mortality rate for their districts than rural districts for the whole State. The rural rate of the State is 65.87, the county rural rates range from 66.32 in Lewis County to 109.38 in Schoharie County. Twenty-eight counties show a higher maternal mortality than the average State rate, with a difference ranging all the way from fifteen per cent to sixty-three.

Many suggestions have been made with an attempt to find some way of alleviating this condition. Last winter I called a conference of leading physicians of the State and we talked over the whole matter and after careful study, the conclusion was reached that there is no doubt that certain communities and districts up-State are lacking in adequate medical care.

Of course, no attempt should be made on the part of the State to impose its own viewpoint on that of any locality, and therefore efforts to meet these health conditions must originate in the localities themselves. Rural counties do not have money to expend and cannot always afford

By ALFRED E. SMITH

Governor of the State of New York

even the time of a public health nurse or the full time of a physician. Some of the better situated counties have tried ways of working out the difficulty. In some instances several small counties have combined and have obtained the full time service of a physician, guaranteeing him an income sufficient to maintain himself. In one or two instances county hospitals have been provided and community hospitals are also under way in some localities. Underlying the establishment of a community hospital is the thought that if the patient can be brought to the hospital, a physician is put into the position of being able to visit a number of patients at one time, instead of having to make a number of visits over difficult roads to scattered homes. The patients would receive better and more expert treatment under first-class conditions, and much time is saved in treatment and in conserving the energy of physicians and nurses. Some of these hospitals might contain only a few beds; five or ten would be sufficient in some instances.

In order to stimulate the founding of such hospitals and the establishment of public health activities, the last session of the Legislature passed a law providing that whenever supervisors of counties having no first or second-class cities, undertake public health work and make an appropriation for it, the State shall appropriate a similar amount, dollar for dollar.

The work to be done must conform to the standards of the State Department of Health. A small committee of physicians, public health experts and people familiar with rural health conditions, together with the

State Department of Health will carry this work forward.

Many things may be accomplished under this program. Public health educational campaigns, and demonstrations designed to bring to residents in rural districts a realization of the importance of maintaining standards of health work which will compare favorably with standards in urban communities may be undertaken.

Hospitals in rural communities in which they are urgently needed may be established and maintained, which unaided, owing to the scattered population, would be a serious burden on their localities, and public health nursing service could be established under like conditions.

A physician or health officer may be maintained in a community in which medical service is not otherwise available, and where, owing to local conditions the income from private practice would be insufficient to attract or maintain a physician.

Under the State support law passed this year health laboratories may be established under similar conditions. It would seem to me that this is a constructive way of dealing with a vital human need, affecting our rural population in the closest possible way. Nothing is so important to the State as the good health of its citizenship and this must apply to the farm dweller as well as the city dweller.

The New York Trespass Law

IF you wish to protect properly your premises from trespassing, they must be posted according to law. The law reads: "Notices or signboards not less than one-foot square warning all persons against hunting, fishing or trespassing thereon for that purpose shall be conspicuously posted not more than forty rods apart, close to and along the entire boundary thereof. The posting of such notices will be sufficient, provided that illegible or destroyed signs be replaced once a year during the months of March, July, August or September, and there shall be so placed at least one notice or signboard on each side, and one at each corner."

If premises are posted as above, your farm is deemed duly protected by law, even if the signs are torn down or defaced.

One who trespasses on posted lands or who removes or defaces the posted signs is guilty of a misdemeanor. Any one may arrest such person, but a better procedure is to take his license number and immediately communicate with the State police. A person may trespass, hunt or fish on posted lands provided he has either written or oral consent from the owner. Written consent is better because it is easier to prove.

It will be noted, therefore, that in order to protect properly your lands this fall, trespass signs must be posted before September 30. Purely as a service to our people, American Agriculturist furnishes at cost, signs which comply with the New York State law. These will be sent you upon receipt of sixty cents a dozen. Address American Agriculturist, 461 Fourth Avenue, New York City.

PROHIBITION BALLOT

OF THE

AMERICAN AGRICULTURIST

Are You for the Strict Enforcement of the 18th Amendment as It Now Stands? ☐ YES ☐ NO

Are You for a Modification of the 18th Amendment to Permit Light Wines and Beer? ☐ YES ☐ NO

Designate your opinion by placing an X in the square opposite Yes or No on each question. Sign your name and address. Your name will be kept strictly confidential.

Name.....

Address.....

Why You Should Vote

Do the American people want prohibition? The Wets emphatically say "No" and the Drys are even more emphatically for it. Both sides claim a majority. Which is right? What do farm people think about it? The opinions of farmers on any problem, if they will express them, go far in determining the outcome of a controversy.

American Agriculturist is taking a vote of farm families on the question of prohibition. It is a vital issue and whether you are for it or against it, be sure to vote in the spaces above. Mail this ballot to the American Agriculturist, 461 Fourth Avenue, New York City.

Get your friends to vote—More ballots furnished on application.

It's So Easy To Mix

with roughage and feeds. Just pour in a pail and dilute with water. Then sprinkle your feed with it.

AMOLCO SEAL High Test Feed Molasses

Your cattle will relish this molasses as it contains a very high percentage of sugar. Amolco Seal also acts as a conditioner and lowers feed bills. Order your supply from your dealer at once!

With the Passing of Dobbin

Sandy Land Farmers Turn to Green Manures

YEARS ago, before the gasoline age, vegetable growers and truck farmers of Long Island and northern Jersey depended, in a large measure, upon manure from city stables to supply their plant food and to furnish the humus supply for their sandy soil. This product of the city stables was loaded on low-sided, open freight cars and great trainloads were hauled out into the country, much to the discomfort of city and town folks who chanced to live near the railroad. This was especially so if the train was stalled any length of time.

This practice of using city stable manure is not altogether a thing of the past, for old Dobbin has not been entirely removed from our cities. However, his numbers are diminishing, and with him his valuable by-product. Consequently the farmers who once de-

However, the use of rye or legumes for green manuring is by no means a practice that should be restricted to Long Island or sandy regions. By adding humus to the soil the physical characteristics are improved and consequently crops have a better medium in which to develop. Rye does not add plant food. However, the legumes such as the clovers and vetches do increase the nitrogen content of the soil.

I know a farmer in western New York who demonstrated the value of turning under a clover crop to the astonishment of his neighbors. He is a good farmer for he leaves his land better than he finds it. He is not a college-trained farmer, but he knows the value of clover. One year in particular he had an unusually fine crop of red clover. Instead of cutting it he plowed it under. His neighbors were horri-

Drilling in rye as soon as the corn is in the shock gives it an opportunity to make good growth, and form a good cover before heavy weather sets in

ended upon city-produced manure are now turning to green manures.

Green manures and cover crops are terms that are almost synonymous. A "cover crop" may be considered a crop which protects the soil from the action of the weather. It becomes a green manure crop when it is plowed under to increase the humic or organic content of the soil. In the case of an orchard cover crop, the application of terms is somewhat different. But we are considering here, cover crops in the regular farm practice, and particularly in the sandy, vegetable-growing sections around New York.

Rye, perhaps, is most commonly used for cover cropping and green manuring. The seed is fairly cheap and it is a quick-growing crop. It improves the physical character of the soil, but adds no plant food. On Long Island, farmers who are finding the lack of city stable manure a handicap and an expense, for it takes considerable labor to handle it from car to field, are turning to rye and commercial fertilizers. They seed their rye as soon as their late potatoes are dug or as soon as the corn is in the shock. This gives the rye an opportunity to get a good start and form a good mat before heavy weather sets in. Long Island soil is very sandy and washes readily. Rye checks this washing completely. The rapid-growing qualities of rye are again in evidence the following spring for it develops appreciably before plowing time.

Another crop being used more every year is crimson clover. This is seeded in between the rows of corn at the time of the last cultivation. The corn is followed with late cabbage the next year. This gives the clover an opportunity to develop fairly well. A demonstration was made of this several years ago by the Nassau County Farm Bureau. The cooperator was a farmer who lived near Jericho on the northern edge of the famous Hempstead Plains. The crop of cabbage which followed the clover was indeed a "bumper." Undoubtedly the nitrogen-fixing power of the bacteria on the nodules on the clover roots had much to do with the rapid growth of the crop.

fied—some called him a fool. But he knew what he was about. The next year, and for years after, that field excelled the neighborhood in crops it bore. The corn crop that followed was the talk of the section. Clover did it. It pays, once in a while, to give a field a rest and plow under a crop like that. —F. W. O., New York.

FROM A CLOVER ENTHUSIAST

W. H. HARRISON

There are numerous crops which may be used to good advantage for winter and spring pasturage and also for the winter cover crop. Yet, from my experience I consider crimson clover the best for both purposes in the southern, eastern and central states. While we are growing such a crop, is it not to our interest to grow one which will in its growth furnish some winter and good early spring grazing, and at the same time add fertility to the soil? In nearly 50 years experience I am fully convinced that crimson clover more fully meets all of these requirements than any other crop.

I have found that it is the greatest and quickest soil builder. It furnishes better and more winter and early spring grazing. It can be cut for early hay if desired. It can be plowed under the latter part of April or early May for a "green manure" crop. The latter part of May the land can be put in order by using only disk harrow and drag, and planted to corn, producing an excellent crop when properly cultivated. There is nothing better for corn than a green clover fallow.

Again, if desired, when the corn is laid by, either cowpeas or crimson clover in our latitude may be seeded. If cowpeas are sown, they can be picked for seed and the vines fallowed under. Then the land can be sown in some kind of a grain crop. This will act for a winter covering, and at the same time produce a fine crop of grain if seasonable, as cowpeas also make a fine "green manure" fallow, nearly equal to crimson clover.

American Fence The Only Original and Genuine

THE only way to measure Fence cost is by years of service. American Fence lasts longer. More pounds of steel, long life galvanizing, better construction.

It protects your property in the best possible way—at the least possible yearly expense.

Why Go to National Dairy Show?

A Few Things That Can Be Seen, Heard and Eaten at This Great Get-to-Gether

WHAT is the National Dairy Show? Why should I attend it?

These questions are entitled to definite answers. Nearly every reader of the American Agriculturist has heard of the Exposition in general. He wants to know the details about it.

The National Dairy Exposition is a great educational nonprofit exhibition, which is held annually in various parts of the country. Its purpose is the visualizing of the extent and importance of America's great dairy industry to dairymen, to buyers and sellers of dairy machinery and equipment, and to consumers of dairy products, and to bring all these people together to promote acquaintance, to buy and to sell, and to increase the use of dairy products. It means to the dairy industry much the same that the annual International Livestock Exposition at Chicago means to the fat-stock industry. It has been held at Chicago, Ill., Columbus, Ohio, Springfield, Mass., and other cities. In both 1921 and 1922 it was held at St. Paul, Minn. It usually attracts several hundred thousand visitors.

It comes to Syracuse October 5-13, 1923, at the urgent invitation of the farm organizations of New York State—the Grange, the Breeders' Association, the Dairymen's League, the Farm Bureau, and others—and of the public agencies dealing with the dairy industry, especially the State Fair Commission, the Department of Farms and Markets, and the College of Agriculture, together with the Syracuse Chamber of Commerce.

Representatives of these organizations and agencies met the Board of Directors of the National Dairy Exposition at Chicago in December, 1922, and urged the holding of the Exposition here in 1923. They were successful largely because of the active interest and the great dairy territory they represented.

Why Attend the Show?

Any person who is interested in seeing the largest and best assemblage of prize winning dairy cattle ever brought together in New York State, and possibly anywhere, needs no other reason for coming. He will be there. These cattle will not all be high-priced pure breeds either. High performing grades that have demonstrated their ability for large and economical production and that are within the reach of normal pocketbooks, will be seen there also.

In all, \$30,700 in prizes are offered. And then the dairyman will find the most complete line of farm, barn and dairy equipment that he probably ever saw together in one place. Dairymen will meet hundreds of other dairymen from other counties and from other

By M. C. BURRITT

States, and this opportunity to exchange experiences is in itself worthwhile.

For Eaters and Drinkers Too

If perchance the reader is not interested in the cows themselves, but in their products, then he will also find much to interest and instruct him in the extensive exhibits of milk and its products. Especially in the "Human Welfare" and "Nutritional" exhibits will be demonstrated to him how vitally important a connection there is between milk and human growth, health, welfare and happiness.

This feature exhibit is being arranged by Miss Edith Barber of the Syracuse Home Bureau, Chairman of the Committee, with the assistance of Mrs. C. G. Bridgen, Chairman of a Special Committee on Relationships with organizations. The story of milk in its relation to human welfare individually and generally will be told graphically and clearly. This one exhibit will be worth a trip to Syracuse for every father and mother and every growing child. The lesson in part will be repeated by many other exhibits. Don't miss it. It may mean adding to your health and happiness and that of your children.

Buyers and Sellers Meet

More floor space for dairy machinery and equipment has been sold to exhibitors than ever before in the history of the Exposition. Almost every article of equipment even remotely related to the production and manufacture of milk and its products may be seen in the various commodious State Fair buildings where the Exposition will be well housed.

It will be a buyers and sellers' paradise. Buyers will be able to compare different makes of equipment; sellers to meet large numbers of their regular as well as new customers. Many firms are calling in their salesmen for conferences. A number of trade conventions will be held.

Special Educational Features

Although the whole Exposition is primarily educational, there will be several special educational features which every dairyman will want to see. Congress has appropriated \$25,000 for a comprehensive exhibit of the United States Department of Agriculture which has been under construction for several months. This exhibit will present the newest information available in the dairy business in graphic form. The marketing problems of the dairyman will be given special attention.

Another special feature of the show will be the New York State exhibit arranged by the Department of Farms and Markets with the aid of the State College of Agriculture and other State agencies for which the State has appropriated \$10,000. This exhibit will include a condensed picture of New York's dairy industry, some essentials in its successful operation, some of the contributions of science to it, together with some of New York's standardized and branded products which are marketed cooperatively.

These are by no means all the attractions which ought to lead one to attend the National Dairy Exposition. The great new coliseum will be filled daily with splendid exhibitions, demonstrations and feature shows. The first two days will be devoted to the competitive boys and girls' club exhibits and to college boys' team judging contests.

World's Dairy Congress

In connection with the Exposition there will meet at Syracuse on October 5-10 the World's Dairy Congress, composed of official delegates from thirty-seven dairy countries of the world. This program is a broad and comprehensive one, open to everyone. It is a great opportunity for eastern dairymen. Immediately following these meetings, extensive automobile tours have been arranged for these delegates and other visitors which will take them to dairy farms and manufacturing plants in

central and northern New York, to the Geneva Experiment Station, and to the dedication of the great new dairy building at the State College of Agriculture at Cornell University.

New York State farmers, through their organizations, played a prominent part in securing this great Exposition for the East in 1923. They are supporting it and helping to make it a success by a State and county-wide committee organization. In fact, they have guaranteed and the Dairymen's League has underwritten one half of an attendance of 100,000 people necessary to pay the expenses of the Exposition. We have therefore both an obligation to support it and an unequalled opportunity to profit by it. Let's meet our obligation and make the most of our opportunity!

WHAT MAKES WHITE SPECKS IN BUTTER?

Would you please advise me what is wrong with my cream? I milk three cows. They are just common stock, but we consider them good cows. Then we separate our milk and I got the separator set so that I have enough skim milk in my cream to make four gallons of cream to churn every other day, but two months ago something went wrong with our cream. My buttermilk and butter was full of little white hard lumps, some as large as tapioca grains. They look and taste like cottage cheese. This trouble is still continuing and my buttermilk after it has stood a little while is yellow with butterfat which would not churn. I tried to see if I could better it by not letting my cream get thoroughly sour; that way I don't get so much cottage cheese in my milk, but the buttermilk is yellow with butterfat.

We took the corn off our cows and just feed them oats chop with pasture to see if that would better the condition, but it did not, so to-day we are grinding corn and cob and oats for them, because the corn seems to give more butterfat. They have spring water also. What little bit of butter I do get is good and I have a ready sale for my butter. I print all of my butter in pound prints and I could sell double my amount if I could get my cream to churn.

I have churned over ten years and never had this experience before. Please tell me what is causing this trouble, for this is wasting cream and I'm anxious to churn.—R. M. G., Pennsylvania.

The cream you are churning is so thin that when it churns, small particles of curd get into the butter and show as white specks. You should set the cream screw in the bowl of your separator so that richer cream will be secured. In fact, the cream screw should be turned into such an extent that you will get only about two gallons of cream every other day instead of four gallons. The cream instead of testing about 14 per cent as it does at present will then test about 28 per cent. Such cream will not only churn more easily, but you will also find that the white specks in the butter will be eliminated and that there will be but little butter rise on the buttermilk after it has stood for a while. The trouble is not with your feed, but in the way you are handling the cream. It is also important to cool the cream quickly and thoroughly after it has been separated.

If two days' cream makes up the churning, the first skimming of cream on the morning of the first day should be cooled to as low a temperature as possible, 50 degrees F. or even lower is desirable. The second skimming of cream which will come the evening of the next day should be thoroughly cooled and then well mixed with the first batch of cream. The third skimming of cream which will be secured on the morning of the second day, should also be cooled thoroughly and then well mixed with the cream, which already has been accumulated. The fourth skimming of cream which will come the evening of the second day should be cooled to 70 degrees F. and the rest of the cream which has been accumulated up to that time should be raised to a temperature of 70 degrees F. and mixed with the fourth skimming. This whole batch of cream should then be left at a temperature of 70 degrees F. over night. By the next morning it will be soured nicely.

To summarize briefly, part of your trouble comes from thin cream, and probably part from the fact that each skimming of cream is not cooled as thoroughly as it should be before being mixed with other cream that is being held to make a churning.

League Net Pool Price \$2.085

What New York Farmers Are Doing and Thinking—Price Prospects Good

THE Dairymen's League Cooperative Association announces that the gross pool for August is \$2.18. From this gross price there will be deducted \$0.095 for expenses, leaving a net price of \$2.085. From this price the Association will borrow 10 cents a hundred on the certificate of indebtedness plan, leaving a cash price to farmers for August milk of \$1.985.

The organization is making satisfactory progress in marketing milk from its own plants in the higher classes.

On September 15 the Association announced increases of 15 cents to 25 cents per case on all Dairylea Evaporated Milk.

Ice cream sales of the Association totaled \$172,626.47 for July as against \$137,549.16 for July a year ago.

"NORTH COUNTRY" NOTES

The fair season is in full swing. The effect of the dry weather is clearly seen in the exhibits of garden stuff and fruit. Many of the cattle show poorer condition than on many years too. The poor pasturage is probably to blame for much of this.

Jefferson County has the largest registration of Junior Project workers of any county in New York State. A. H. Adams, the club leader is a hustler and well liked. He has just finished holding nineteen community fairs for juniors, and the best exhibits from each community are competing at the county fair this week for the county prizes. Many of the young farmers have beaten their parents in the vegetables, poultry, or calves that have grown.

The National Dairy Show is receiving a good deal of interest and many are planning to attend. As so many prefer to drive their cars, it is still undecided as to whether a special train will be run. The County Committee with B. L. Johnson, County Pomona Master as chairman, is pushing hard toward a large delegation.

The Farm Bureau is doing all that it can to help the poultry owners help themselves in staying in the poultry business during the time of rather depressed prices that seems to be in store. A series of culling demonstrations, followed by a paid culler have covered most communities of Jefferson County, as well as St. Lawrence and Lewis. Most efficient methods of feeding have received attention and discussion at the same time.

Feeling toward the Dairymen's League seems to be changing somewhat as the season wears away. The appointment of Director J. A. Coulter of Woodville to the Executive Committee has had no small part in this change, as Mr. Coulter is held in the highest regard by poolers and non-poolers alike, and has already had a part in solving some problems peculiar to the north country.

Hard times financially is having its effect on the farm organizations up this way. Membership in the farm bureaus is much reduced this year as are the Granges. Reports given at the Jefferson Pomona Grange last week showed a falling off of membership in most of the locals. One or two showed an increase as a result of an intensive campaign.

The drought has hit the seed industry here. Peas were a fair crop, but did not fill out and the peas are small. Beans stood the dry weather better than some crops, but many of the pods have but one or two mature beans in. The canning factory peas were a good crop, but the corn is almost a failure.

Retail price of milk in Watertown advanced to 13 cents on September 1, and Grade A milk reached 16 cents. Eggs are bringing 40 to 45 cents.—W. I. R.

ALONG THE SOUTHERN TIER

The new public market at Binghamton is now open for business and consumers of the city are more and more learning the advantage of buying direct from the farm. Both open-shed and inclosed booths are provided for farmer patrons.

Although pastures have been short-

ened up for good this fall, the recent rains have freshened them materially. Some farmers, however, are feeding their cows quite as they would in winter. Up to the second week in September no killing frosts have visited this section.

A large barn on the farm of L. J. Emerson, in Maine Township of Broome County, was burned recently. A large amount of hay and many valuable tools were lost. Most of the hay was cut in 1922, and the origin of the fire is unknown. A small insurance had been carried on the property.

A stretch of highway about a mile in length is being improved from a point a mile north of the village of Maine.

Early potatoes are practically a failure in Broome County. The late ones will be fairly good, but few in a hill. They are selling for \$1.50 a bushel, when sold at all. Apples are scarce and small. Late rains will, it is hoped, add somewhat to the size. We had very few blackberries here. Dry weather dried them on the canes.

Silo filling is under way earlier than usual. Farmers find the crop better than earlier reports indicated. Some fine yields of oats are reported. The grain is of good quality. Buckwheat fields are uneven and filling only fairly well. Timothy hay is selling from \$23 to \$25 a ton. Most farmers have none to sell.—E. L. V.

WESTERN NEW YORK NEWS

Preparations are rapidly going forward to move the fruit crop of western New York. About 5,000 refrigerator cars have been put in shape for the season and eighteen special trains will be put on the New York Central, tapping the fruit belt, to take care of the harvest. The engines which will haul the trains are now at the Oswego shops being conditioned. It will be along towards the middle of September before the traffic gets under big headway. Surveys made by the agricultural experts of the railroad, place the harvest this year at about 70 per cent of a normal crop.

Onion growers in the Elba district, embracing about 800 acres of muck soil devoted to vegetables, are beginning their harvest. The onions will average in yield from 450 to 500 bushels per acre, though a few growers by superior cultural methods are expecting 1,000 bushels to the acre. The price has not yet been set, but the talk is around \$2 per bushel. Out in Genesee county the growers dispute the claims of the government experts that there will be a plentiful crop this year. It is held by them that the government officials are entirely too optimistic. Growers who have visited the best fields of Ohio and Indiana, state upon their return that there will not be more than a forty per cent crop and the quality is inferior to that of York State onions.

A sudden jump in the prices of evaporated raspberries is noticed in the Dundee district. Growers are now selling their product for fifty cents per pound. It is freely predicted that prices will go still higher. High prices prevailing for early berry crops are believed to be the cause of the jump.

The largest potato crop in the State outside of Long Island is believed to be that in the Oswego district. Those touching at Kasoag this summer are interested in the largest field ever grown in this section of the State, consisting of 83 1/2 acres on the farm of Earl R. Smith, often styled as the "Kasoag Potato King." In all, Mr. Smith has 105 acres of potatoes under cultivation. Within a radius of two miles of Kasoag there is a greater acreage of potatoes than in any other spot of like area in the State. The crops are certified by the State department of agriculture as being practically free from all potato diseases and practically all potatoes grown are sold as seed. In spite of the fact that serious results have been brought about by the dry weather during the summer the crop in this section has done well and a good yield is expected when the harvest is completed.

Heavy dews and cool nights have been a great aid to the growing plants.

The annual picnic of the Ontario County Farm Bureau, Grange and Supervisors of Ontario County was held on August 30 at the Geneva Experiment Station grounds with an attendance of fully two thousand people. The event of the day was an address in Jordan Hall by Enos Lee, of Yorktown, president of the New York State Farm Bureau Federation, whose subject was: "World Markets as Related to Agricultural Products in the United States." His general tone was along optimistic lines, taking the point that the agriculturist at the present time is in a better condition financially than a year ago.

The Penn Yan Fruit Packing Association, Inc., has started work on the erection of a new building, 40 by 100 feet, of fireproof construction. This company controls the only cooperative plant in Penn Yan. It is expected that temporary use can be made of the plant this month. The officers of the association back of the project are: President, E. C. Gillett; secretary, A. C. Williams; manager, Michael F. Buckley.—ALVAH H. PULVER.

NEW YORK COUNTY NOTES

Ontario Co.—August was dry and hot and we have not had a good rain for a long time. The rains have all been local. Some farmers that have tractors cannot plow for wheat. All crops are suffering for rain, especially potatoes, beans and cabbage. Late set cabbage is very backward. Wheat has yielded well, also oats and barley. Apple buyers are holding off in buying. Bartlett pears are 4c per pound at canneries.—E. T. B.

Wyoming Co.—Grain threshing is nearly over in this locality, the average yield of wheat and oats a little less than usual. The few showers we have had helped the beans and late potatoes wonderfully. The frost in August has caused many farmers to pull their beans earlier than usual. This of course, will lighten the yields. Potatoes are selling at \$1.50 per bushel, eggs 35c per dozen.—L. M. F.

Saratoga Co.—The attendance at the Saratoga County Fair broke all previous records. The exhibits in all lines were of the finest order. In everyway the fair of 1923 was pronounced a grand success. No frosts in this vicinity and vegetation making rapid growth.—E. S. R.

FAMOUS LOCAL FAIRS

There are fairs and fairs, ranging all the way from exhibitions worth going many miles to see, to those which come pretty close to being humbug. Among those fairs which are justly celebrated as worth anyone's time and money to attend and which will be held in the near future, are:

Mineola, N. Y., September 25-29.

Trenton, N. J., September 24-29.

Brockton, Mass., October 2-6.

Danbury, Ct., October 1-6.

NEW YORK APPLES TO BE MARKETING COOPERATIVELY

With the assistance of the State Bureau of Markets, Albany, N. Y., the Hudson Valley Fruit Growers' Cooperative Association, Inc., which was organized and incorporated for the purpose of acting as a central sales agency for the local cooperative packing houses, already established and to be established in the Hudson Valley, has completed its plans for the central selling of 35,000 to 40,000 barrels of apples, mostly winter varieties. This estimated volume of business is being furnished by five local member associations. All fruit will be pooled and the operations of the central will be conducted on a cooperative basis.

Take your local editors with you to the Dairy Show. They will get one of the biggest dairy stories they ever printed. Boost your own business.

The Service Bureau

Swindles of Which Farm Folks Must Beware

ONE swindle after another crops up to wheedle the hard-earned dollar from the farmer's pocket. But sometimes we cannot help feeling that the farmer and his wife are good subjects for a hypnotist. We hear so often of how they "fell" for a slick salesman's talk that we are thinking of putting on the market some patent ear-stoppers to be inserted when the line of talk begins and before the victim weakens. We know it would make money for the American Agriculturist and save money for the farmer, so everybody would be pleased except Mr. Slick, agent for goodness-knows-what.

Recently a subscriber wrote us as follows:

"A young man, a stranger, is canvassing our town selling United States Army goods with astonishing results.

"After first stating his name and address, he begins his talk something like this:

"I have been appointed to distribute United States Army goods in this vicinity. No doubt you have read in your farm magazines that the Government has been making an appraisal of all goods still on hand and is now distributing them through agents to the people at one-half or less price."

"He had officers' blankets, which he said were more valuable than private blankets, for \$6.00 each. Only six could be sold to one family.

All Sorts of "Army" Goods

"Besides these blankets he had cotton and flannel shirts, socks, gloves, raincoats, etc. He also had a quantity of wool dress patterns, five yards in length; also gingham, table linen and linen toweling.

"He said that when the Government took over the big mills for ammunition factories they had to assume all the cloth in the mills at that time, hence the dress goods and linen. These were bunched in lots. In lot one, for \$14.00, was a blanket, 4 pairs of socks, toweling, one piece of wool goods and one of gingham. Lot two, for \$26.00, consisted of one blanket, one raincoat, a linen tablecloth, 6 yards of toweling, one wool dress, 5 yards; one gingham, 5 yards; 4 pairs of socks, 2 pairs of gloves. He would not sell any of the dress goods separately.

"It was astonishing the way the farmers bought. One of our neighbors bought \$70.00 worth and ordered more.

Nearly everyone took from \$14.00 to \$40.00 worth. Farmers who would have been appalled if their wives had asked for \$25.00 to go to the city and purchase the same kind of goods, bought \$50.00 or \$100.00 worth of this young man.

"He said he was paid a salary and repeatedly told us that it made no difference to him whether we bought one or one hundred dollars worth.

Was He a Hypnotist?

"We spent \$41.00. And as soon as he was out of sight I began to doubt. He has been gone less than an hour and I wish I had my money back. Did he hypnotize us? Money is none too plentiful in our home. We could have done without the majority of the articles we purchased. As I look over the assortment I try to find some stamp or mark showing that Uncle Sam once

owned these goods, but I find none. So far as looks go, I might have purchased them in the city at a remnant counter.

"The war has been over for nearly five years. Has the Government on hand, after all these years, huge stocks of blankets, shirts, dress goods? This young man said the raincoats were made of gas mask material. Is this true? I know you have always stood for fair play and I would be very grateful to hear from you and have my doubts either confirmed or denied."—MRS. L. F. B., New York.

To Mrs. B.'s letter we replied:

"It certainly is too bad that you and others in your locality have been victimized by a smooth-tongued salesman. Of course, we have not seen what he is attempting to sell, but it is possible that he really had United States Army goods. He would probably not have been 'appointed' to distribute them, because we do not think the Government has acted in this way.

"There have been large sales of Government supplies of all sorts, including clothing, shoes, blankets, etc. It is perfectly possible that he might have bought at very low prices and really be selling army goods. On the other hand,

he has probably charged a great deal more than a fair profit, and of course there is the chance that a good deal of the stuff is just bargain-counter material picked up in one way or another.

"We will write this up as an example of clever salesmanship, but we doubt whether you have any grounds for redress, and in fact, not having the name of the young man, there is no way in which you could reach him. Furthermore, we gather from your letter that you did not ask him to show any paper giving him authority to represent the Government. Of course, if he had done this, and if it were forged, the Government would take it up, but if he merely claimed to, and if no one asked him to make his claim good, people buying from him had no one to blame but themselves for their credulity."

ONE MORE SWINDLE

One more swindle is going the rounds, and this time the ladies are the victims!

A plainly-dressed woman appears with the statement that she is a dress-maker with a new system of making clothes, an improvement over old ways. She offers to take the measurements of the lady of the house and take to her home, which she gives as a familiar street in the nearest county seat, any dress goods that may be unmade. She promises to return the finished dress in a week or ten days, at a rate that is far below what a good dressmaker would charge. She does this, she explains, to introduce her work, and when she gets a start her rates will go up, so it pays to take advantage of the introduction offer. Of course she is a stranger, and of course the woman never sees her goods again.

Perhaps in some other section she will appear as a peddler with wonderful bargains in dress goods. She presents one more swindle of which the farm woman must beware.—HILDA RICHMOND.

The Broad Highway—By Jeffery Farnol

CHAPTER I

CHIEFLY CONCERNING MY UNCLE'S LAST WILL AND TESTAMENT

"AND to my nephew, Maurice Vibart, I bequeath the sum of twenty thousand pounds in the fervent hope that it may help him to the devil within the year, or as soon after as may be."

Here Mr. Grainger paused in his reading to glance up over the rim of his spectacles, while Sir Richard lay back in his chair and laughed loudly. "Gad!" he exclaimed, still chuckling, "I'd give a hundred pounds if he could have been present to hear that," and the baronet went off into another roar of merriment.

Mr. Grainger, on the other hand, dignified and solemn, coughed a short, dry cough behind his hand.

"Help him to the devil within a year," repeated Sir Richard, still chuckling.

"Pray proceed, sir," said I, motioning towards the will. . . . But instead of complying, Mr. Grainger laid down the parchment, and removing his spectacles, began to polish them with a large silk handkerchief.

"You are, I believe, unacquainted with your cousin, Sir Maurice Vibart?" he inquired.

"I have never seen him," said I; "all my life has been passed either at school or the university, but I have frequently heard mention of him, nevertheless."

"Egad!" cried Sir Richard, "who hasn't heard of Buck Vibart—beat Ted Jarraway of Swansea in five rounds—drove coach and four down Whitehall—on sidewalk—ran away with a French marquise while but a boy of twenty, and shot her husband into the bargain." Celebrated figure in 'sporting circles,' friend of the Prince Regent—

"So I understand," said I.

"Altogether as complete a young blackguard as ever swaggered down St. James's." Having said which, Sir Richard crossed his legs and inhaled a pinch of snuff.

"Twenty thousand pounds is a very handsome sum," remarked Mr. Grainger ponderously.

"Indeed it is," said I, "and might help a man to the devil as comfortably as need be, but—"

"Though," pursued Mr. Grainger, "much below his expectations and sadly inadequate to his present needs, I fear."

"That is most unfortunate," said I, "but—"

"His debts," said Mr. Grainger, busy at his spectacles again, "his debts are very heavy, I believe."

"Then doubtless some arrangement can be made to—but continue your reading, I beg," said I.

MR. GRAINGER repeated his short dry cough, and taking up the will, slowly and almost as though unwillingly, cleared his throat and began as follows:

"Furthermore, to my nephew, Peter Vibart, cousin to the above, I will and bequeath my blessing and the sum of ten guineas in cash, wherewith to purchase a copy of Zeno or any other of the stoic philosophers he may prefer."

Again Mr. Grainger laid down the will, and again he regarded me over the rim of his spectacles.

"Good God!" cried Sir Richard, leaping to his feet, "the man must have been mad. Ten guineas—why, it's an insult—you'll never take it, of course, Peter."

"On the contrary, sir," said I.

"But—ten guineas!" bellowed the baronet; "on my soul now, George was a cold-blooded fish, but I didn't think even he was capable of such a despicable trick—no—curse me if I did! Why, it would have been kinder to have left you nothing at all—but it was like George—bitter to the end—ten guineas!"

"Is ten guineas," said I, "and when one comes to think of it, much may be done with ten guineas."

Sir Richard grew purple in the face, but before he could speak, Mr. Grainger began to read again:

"Moreover, the sum of five hundred

thousand pounds, now vested in the funds, shall be paid to either Maurice or Peter Vibart aforesaid, if either shall, within one calendar year, become the husband of the Lady Sophia Sefton of Cambourne."

"Good Heavens!" exclaimed Sir Richard.

"Failing which," read Mr. Grainger, "the said sum, namely, five hundred thousand pounds, shall be bestowed upon such charity or charities as the trustee shall select. Signed by me, this tenth day of April, eighteen hundred and ———, GEORGE VIBART. Duly witnessed by ADAM PENFLEET, MARTHA TRENT."

HERE Mr. Grainger's voice stopped, and, in the silence that followed, the parchment crackled very loudly as he folded it precisely and laid it on the table before him. Sir Richard was swearing vehemently under his breath as he paced to and fro between me and the window.

"And that is all?" I inquired at last.

"That," said Mr. Grainger, not looking at me now, "is all."

"The Lady Sophia," murmured Sir Richard as if to himself, "the Lady Sophia!" And then, stopping suddenly before me in his walk, "Oh, Peter!" said he, clapping his hand down upon my shoulder, "oh, Peter, that settles it; you're done for, boy—a crueller will was never made."

"Marriage!" said I to myself.

"Hum!"

"A damnable iniquity!" exclaimed Sir Richard, striding up and down the room again.

"The Lady Sophia Sefton of Cambourne!" said I, rubbing my chin.

"Why, that's just it," roared the baronet; "she's a reigning toast—most famous beauty in the country, London's mad over her—she can pick and choose from all the finest gentlemen in England. Oh, it's 'good-by' to all your hopes of the inheritance, Peter."

"Sir, I fail to see your argument," said I.

"What?" cried Sir Richard, facing round on me, "d'you think you'd have a chance with her then?"

"Why not?"

"Without friends, position, or money? Pish, boy! don't I tell you that every buck and dandy—every mincing macaroni in the three kingdoms would give his very legs to marry

"Sir Richard," said I, "should I ever contemplate marriage, which is most improbable, my wife must be sweet and shy, gentle-eyed and soft of voice, instead of your bold, strong-armed, horse-galloping creature; above all, she must be sweet and clinging—"

"Sweet and sticky, oh, the devil! Hark to the boy, Grainger," cried Sir Richard, "hark to him—and one glance of the glorious Sefton's bright eyes—one glance only, Grainger, and he'd be at her feet—on his knees—on his confounded knees, sir!"

"The question is, how do you propose to maintain yourself in the future?" said Mr. Grainger at this point; "life under your altered fortunes must prove necessarily hard, Mr. Peter."

"And yet, sir," I answered, "a fortune with a wife tagged on to it must prove a very mixed blessing after all. Surely there must be some position in life that I am competent to fill, some position that would maintain me honorably and well; I flatter myself that my years at Oxford were not altogether barren of result—"

"By no means," put in Sir Richard; "you won the high jump, I believe?"

"Sir, I did," said I; "also 'throwing the hammer.'"

"And spent two thousand pounds per annum?" said Sir Richard.

"Sir, I did, but between whiles managed to finish a new and original translation of Quintilian, and also a literal rendering into the English of the *Mémoires* of the *Sieur de Brantôme*."

"For none of which you have hitherto found a publisher?" inquired Mr. Grainger.

"NOT as yet," said I, "but I have great hopes of my *Brantôme*, as you are probably aware this is the first time he has ever been translated into the English."

"Hum!" said Sir Richard, "ha!—and in the meantime what do you intend to do?"

"On that head I have as yet come to no definite conclusion, sir," I answered.

"I have been wondering," began Mr. Grainger, somewhat diffidently, "if you would care to accept a position in my office. To be sure the remuneration would be small at first and quite insignificant in comparison to the income you have been in the receipt of."

"But it would have been money earned," said I, "which is infinitely

tinted by the rosy glow of sunset, trees that stirred sleepily in the gentle wind, and far away I could see that famous highway, built and paved for the march of Roman Legions, winding away to where it vanished over distant Shooter's Hill.

"And pray," said Sir Richard, still frowning at the ceiling, "what do you propose to do with yourself?"

NOW, as I looked out upon this fair evening, I became, of a sudden, possessed of an overmastering desire, a great longing for field and meadow and hedgerow, for wood and coppice and shady stream, for sequestered inns and wide, wind-swept heaths, and ever the broad highway in front. Thus I answered Sir Richard's question unhesitatingly, and without turning from the window:

"I shall go, sir, on a walking tour through Kent and Surrey into Devonshire, and thence probably to Cornwall."

"And with a miserable ten guineas in your pocket? Preposterous—absurd!" retorted Sir Richard.

"On the contrary, sir," said I, "the more I ponder the project, the more enamored of it I become."

"And when your money is all gone—how then?"

"I shall turn my hand to some useful employment," said I; "digging, for instance."

"Digging!" ejaculated Sir Richard, "and you a scholar—and what is more, a gentleman!"

"My dear Sir Richard," said I, "that all depends upon how you would define a gentleman. To me he would appear, of late years, to have degenerated into a creature whose chief end in life is to spend money he has never earned, habitually to drink more than is good for him, and, between whiles, to fill in his time hunting, cock-fighting, or watching entranced while two men pound each other unrecognizable in the prize ring. Occasionally he has the good taste to break his neck in the hunting field, or get himself gloriously shot in a duel, but the generality live on to a good old age."

"Deuce take me!" ejaculated Sir Richard feebly, while Mr. Grainger buried his face in his pocket handkerchief.

"To my mind," I ended, "the man who sweats over a spade or follows the tail of a plow is far nobler and higher in the Scheme of Things than any of your young 'bloods' driving his coach and four to Brighton to the danger of all and sundry."

Sir Richard slowly got up, out of his chair, staring at me open-mouthed. "Good God!" he exclaimed at last, "the boy's a Revolutionary."

I SMILED and shrugged my shoulders, but, before I could speak, Mr. Grainger interposed:

"Referring to your proposed tour, Mr. Peter, when do you expect to start?"

"Early to-morrow morning, sir."

"I will not attempt to dissuade you, well knowing the difficulty," said he, with a faint smile, "but a letter addressed to me at Lincoln's Inn will always receive my most earnest attention." So saying, he rose, bowed, and having shaken my hand, left the room, closing the door behind him.

"Peter," exclaimed the baronet, striding up and down, "Peter, you are a fool, sir, a hot-headed, self-sufficient young fool, sir, curse me!"

"I am sorry you should think so," I answered.

"And," he continued, regarding me with a defiant eye, "I shall expect you to draw upon me for any sum that—that you may require for the present—friendship's sake—boyhood and—and all that sort of thing, and—er—oh, damme, you understand, Peter?"

"Sir Richard," said I, grasping his unwilling hand, "I—I thank you from the bottom of my heart."

"Pooh, Peter!" said he, snatching his hand away.

"Thank you, sir," I reiterated; "be sure that should I fall ill or any unforeseen calamity happen to me, I will most gladly, most gratefully accept your . . . (Continued on page 201)

STARTING THIS WEEK—THE BROAD HIGHWAY

ENGLAND of the Georges—perfumed dandies and dashing belles—roadside taverns and tankards of ale—dangling gibbets, highwaymen, ladies in distress and tattered philosophers—the tranquil beauty of English country and the comradeship of the open road, all are unfolded in this story of adventure and romance.

In the first installment, Peter Vibart, disinherited, starts out to explore the Broad Highway—life itself—in spite of the wish of his loyal friend, Sir Richard, a hard-swearing, tender-hearted old baronet, to keep him in London. What happens to Peter—and he never lacks adventure—will be set forth in succeeding numbers.—The Editors.

her—either for her beauty or her fortune?" spluttered the baronet. "And let me inform you further that she's devilish high and haughty with it all—they do say she even rebuffed the Prince Regent himself."

"But then, sir, I consider myself a better man than the Prince Regent," said I.

Sir Richard sank into the nearest chair and stared at me open-mouthed.

"Deuce take me!" said he.

"Referring to the Lady Sophia, I have heard that she once galloped her horse up the steps of St. Paul's Cathedral—"

"And down again, Peter," added Sir Richard.

"Also she is said to be possessed of a temper," I continued, "and is above the average height, I believe, and I have a natural antipathy to termagants, more especially tall ones."

"Termagant!" cried Sir Richard.

"Why, she's the handsomest woman in London, boy. She's none of your milk-and-watery, meek-mouthed misses—curse me, no! She's all fire and blood and high mettle—a woman, sir—glorious—divine!"

preferable to that for which we never turn a hand—at least, I think so."

"Then you accept?"

"No, sir," said I, "though I am grateful to you, and thank you most sincerely, yet I have never felt the least inclination to the law; where there is no interest one's work must necessarily suffer, and I have no desire that your business should be injured by any carelessness of mine."

"What do you think of a private tutorship?"

"It would suit me above all things were it not for the fact that the genus 'Boy' is the most aggravating of all animals, and that I am conscious of a certain shortness of temper at times, which might result in pain to my pupil, loss of dignity to myself, and general unpleasantness to all concerned—otherwise a private tutorship would suit most admirably."

Here Sir Richard took another pinch of snuff and sat frowning up at the ceiling, while Mr. Grainger began tying up that document which had so altered my prospects. As for me, I crossed to the window and stood staring out at the evening. Everywhere were trees

Opportunity Calls from CANADA

Pay a visit to Canada—see for yourself the opportunities which Canada offers to both labor and capital—rich, fertile, virgin prairie land, near railroads and towns, at \$15 to \$20 an acre—long terms if desired. Wheat crops last year the biggest in history; dairying and hogs pay well; mixed farming rapidly increasing.

Homeseekers' Rates on Canadian Railroads

If you wish to look over the country with a view to taking up land get an order from the nearest Canadian Government Agent for special rates on Canadian railroads. Make this your summer outing—Canada welcomes tourists—no passports required—have a great trip and see with your own eyes the opportunities that await you.

OIL LIGHT BEATS ELECTRIC OR GAS

BURNS 94% AIR

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal oil).

The inventor, R. M. Johnson, 642 N. Broad St., Philadelphia, is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him to-day for full particulars. Also ask him to explain how you can get the agency, and without experience or money make \$250 to \$500 per month.

"Everlasting Dough"

Recipes For Delicious Rolls at Short Notice

WHEN the bride who was taking supper with us exclaimed: "I don't see how you can find time to make these delicious hot rolls with all your work," I was glad enough to tell her about "Everlasting Dough."

This new short cut—a recipe sent out by the Home Economics experts at the University of Wisconsin—has been a great help to me in giving my hungry family a treat too time-consuming for frequent appearance in the old way.

The recipe is this:

One quart of milk scalded and cooled, 1 cup mashed potato, 1 cup sugar, 1 cup melted lard, 2 teaspoons salt, 2 teaspoons baking powder, 1 cake compressed yeast softened in half a cup of water, 1 teaspoon soda, flour to make a soft sponge.

"You let it stand until it is very light before adding enough flour to make a stiff dough," I explained to the bride, "then knead it well, and put it away in a cool place for 24 hours."

"You can make enough for a week's supply at one time—it will keep very well these cold autumn days. Then you can take out some dough and have hot rolls, or anything you could make with ordinary bread dough whenever you like."

"But what makes it keep?" asked this very practical young person.

"The baking powder, the soda, and a cold place take care of that. The cold, retards the action of the yeast. The baking powder gives it minerals which encourage it to grow. Then the soda neutralizes the acid which the yeast gives off in growing. All together they keep the mixture sweet and wholesome."

"In making sweet rolls, I take out two cups of dough and knead in ½ cup of sugar, and ½ cup of raisins. I just roll little chunks of the dough into balls, and let them rise. It isn't any work at all."

Two Good Recipes

I sent the little bride away with two of the recipes sent out by the department tucked carefully away in her pocket. My last goodnight was followed by a shouted warning as she went out to the car.

"Remember to keep the dough in a very cool place, and knead it down every day. If it should sour the least

little bit, work in a little more soda, and I am sure it will be all right."

Cinnamon Rolls.—Roll the dough to ¼-inch thickness, spread with melted butter and sprinkle with a mixture of six parts of sugar and one part cinnamon. Cover with stoned or chopped raisins or with currants. Roll like a jelly roll and cut in ¾-inch pieces. Place these in an oiled bread tin flat side down, and let them rise until very light. Bake in a hot oven.

Hot Cross Buns.—Flavor 2 cups of the dough with ¼ teaspoon cinnamon, and ¼ cup of stoned or quartered raisins. Let it rise over night and form into buns. Place in a bread pan one-inch apart. Let them rise. With a sharp knife cut a cross on the surface of each. Bake twenty minutes.—VERA MESCHAM.

THE NEW CATALOGUE

"Bigger and better than ever" is the annual fall pattern book, a really invaluable aid for the woman who does her own sewing. The very low price—10c—puts the book within reach of every reader, and when you consider that in

addition to the pictured styles there are illustrated articles on stitches, trimmings and difficult points in home dressmaking, you will see that this is indeed a bargain of bargains. Send ten cents for your copy to-day.

THREE SERVICEABLE DESIGNS FOR THE HOUSEWIFE

THE long bloomers have quite supplanted petticoats and seem to give better fit to dresses and more comfort to the wearer. The home dressmaker can easily make them in either length shown.

No. 1862 cuts in sizes 16 years, 28, 32 and 36 inches waist measure. To make the bloomers in the 28-inch size will require 2½ yards of 36- or 40-inch material. Price 12c.

No. 1771 is a simple, stylish dress to make; it has becoming lines, yet is not fussy. The dress is slashed in from under arm edges, the lower edges gathered and joined to upper slashed edges.

No. 1771 is cut in sizes 16 years, 36, 38, 40, 42 and 44 inches bust measure. The 36-inch size requires 3½ yards of 36-inch material, with ¾ yard contrasting. Price 12c.

A ONE-PIECE apron appeals to any woman who either sews or wears this popular garment. The diagram shows how easy this style is to make.

No. 1655 cuts in one size only. It requires 2½ yards of 27-inch material, with 9 yards of edging or rick-rack braid. Price 12c.

To Order: Write name, address, pattern numbers, and sizes clearly, enclose correct amount—stamps or coin (wrap coin carefully)—and send to Pattern Department, American Agriculturist, 461 Fourth Avenue, New York City.

Add 10c for the new catalogue! You will surely want it!

Peggy Keith—Farm Girl

The Story of a Typical American Youngster

YOU'D grin, too, if you had to your credit all the achievements which Peggy Keith is able to count as hers. For Miss Peggy is an American farm girl whose fame has spread from one coast to the other. She has been heralded as the leader of 75,000 other farm girls, and it would be hard to find anyone anywhere who could touch her record, let alone equal it.

As a result of her livestock enterprises, started when she joined a local Girl's Club at the age of eight, she will come this fall to the Eastern States' Exposition at Springfield, Mass. Peggy and her Guernseys will be there at the Department of Agriculture Exhibit, from September 16 to 23, but she will have left at home many more exhibits of her skill, for Guernseys are not the only animals that bespeak Peggy's interest.

The New York "World" mentions a few in a recent article which calls her "America's most able farm girl." Pictures show Peggy with her prize colliers, with a prize cockerel, and with the Guernsey cattle, which are her particular pride. Her home is in Fanquier

County, Virginia, near Warrenton; she was raised on a 535-acre farm which her mother has managed for many years.

Milk-Drinking Made Her Strong

When three years old, the little girl was given a Shetland pony, Corinna. And Corinna still kicks up her heels on the Keith farm, nor will her owner sell her, though often tempted. Peggy, be it noted, was not a strong baby. She was always a fighter though, and now is as sturdy as one could wish. She has always been a milk-drinker and keeps up the good habit.

When she was eight years old, she joined the potato club, planting, cultivating and harvesting her small crop. The plot grew and corn was added. Then she planted tomatoes, and put them up. Next came a setting of eggs, which started her in the poultry business. By the time she was twelve, she had capital and strength enough to launch into the cattle line.

She took short courses in stock judging and went to junior shows. Meanwhile, she finally obtained a calf in payment for feeding and caring for others. She kept trading for better, until she could get a registered Guernsey heifer. Now she has four pure-bred cows and a pure-bred bull.

But Peggy has not forgotten the ponies, for Corinna started her in that line, too. She has a herd of twenty, and also raises white collie pups. With the exception of the Shetland pony, Corinna, Peggy has herself earned everything she owns. At little more than 15, she now has in her own name \$10,000 worth of livestock.

Trying For New Honors

"Peggy has demonstrated with the most compelling force that honest, hard work is clean, wholesome, honorable and dignified," says the "World." "She is not ashamed to perform the common

farm tasks and her calloused hands show it."

Now Peggy Keith, with three younger sisters to help her, is to go up against the experienced breeders and showmen who will exhibit at Springfield. There are at home twenty silver cups, one gold cup, and scores of ribbons to bear witness to her zeal in the business which she has chosen. She may bring home more—and she may not. But whatever the outcome of her trip North, she has shown that an American farm girl with pluck, initiative and common sense can hold her own, in the battle to make farming pay. She is an inspiration not only to youngsters of the club age but to "oldsters" as well.

Hats off to Peggy Keith!

A SCHOOL INFORMATION BUREAU

An energetic rural teacher in Illinois was discouraged with the lack of co-operation from the parents of her pupils. They seldom visited the school, leaving her to meet all the struggles and victories alone.

She called her older boys together and had them fit an old bookcase with pigeonholes and magazine partitions. To the girls she gave the pleasant task of lettering these alphabetically. Then the pupils were instructed to look out for all articles on farm life or progress, to clip them, whenever possible, and file them in the proper compartments.

In one-half of the bookcase subjects likely to appeal to men were filed; in the other, were valuable hints for women concerning domestic problems, club-papers, pin-money items, flower, bee, poultry-raising and the like. Many subjects important in farm life were covered by latest reports—diseases of stock, proper feeding of animals, crop-rotation, insect pests and preventatives, and market reports; and easier way of making cake, weaving rugs, drying fruit or dyeing dresses.

Parents became really interested and new items were sent constantly to this school information bureau. It was open every school day and on special occasions, the only stipulation being that the piece or pattern was to be copied, so that the original might always be on hand for reference. Many farmers or farmers' wives soon made it a habit to stop by for the latest news and ideas; and when they came they stayed a while to visit with their own and their neighbors' children. The children also learned to recite easily before "company" and gained as much poise as their older city brothers and sisters.—BELL ELLIOTT PALMER.

The Broad Highway

(Continued from page 199)

generous aid in the spirit in which it is offered, but—

"But?" exclaimed Sir Richard.

"Until then—"

"Oh, the devil!" said Sir Richard, and ringing the bell ordered his horse to be brought to the door, and thereafter stood with his back to the empty fireplace, his fists thrust down into his pockets, frowning heavily and with a fixed intentness at the nearest armchair.

Sir Richard Anstruther is tall and broad, ruddy of face, with a prominent nose and great square chin whose grimness is offset by a mouth singularly sweet and tender, and the kindly light of blue eyes; he is in very truth a gentleman. Indeed, as he stood there in his plain blue coat with its high roll collar and shining silver buttons, his spotless moleskins and heavy, square-toed riding boots, he was as fair a type as might be of the English country gentleman. It is such men as he, who, fearless upon the littered quarter-decks of reeling battleships, undismayed amid the smoke and death of stricken fields, their duty well and nobly done, have turned their feet homewards to pass their latter days amid their turnips and cabbages, beating their swords into pruning-hooks, and glad enough to do it.

Reviewing the Latest Eastern Markets and Prices

OUTLOOK FOR McINTOSH

HERSCHEL H. JONES

McINTOSH in barrels sold as high as \$8 at New York last week and the prospects looked good for a firm market on A Grade 2½-inch and over of good color. Some bushel baskets were received, selling at a top price of \$2.25 at end of week.

In 1922, the highest wholesale prices for McIntosh in the New York market were obtained in March, when quotations went up to \$17 per barrel. Some individual sales outside the wholesale market were reported at \$18 and even higher. The market started off in September, 1922, at a top price of \$5 and went up to \$6.50 toward the end of September. In October the average top quotation was around \$6. The highest wholesale quotation for McIntosh for October and November, 1922, was \$7.50 per barrel the first of October. When receipts of western boxed apples of red varieties became heavy the market declined on McIntosh. It advanced again, however, toward the end of December to \$8, and then in February took a rapid jump up to \$13.

In 1921 the trend of the market was almost the reverse of 1922. The highest prices in the entire season for McIntosh were obtained in the last week of September, when the top quotation was \$13. They declined in October, when the receipts of western apples were heavy and continued low until December, when the top price of \$10 was reached, and after the first week in December they never reached higher than \$9.

The following table gives the average monthly prices of McIntosh apples per barrel:

Date	1903-1913	1921	1922
September	\$2.93	\$8.37 @ 10.87	\$3.93 @ 5.50
October	3.58	7.00 @ 9.75	4.79 @ 5.79
November	3.64		5.57 @ 6.21
December	3.70	9.00 @ 10.00	6.94 @ 7.44
January		7.36 @ 8.00	7.64 @ 8.11
February			10.62 @ 11.50
March			15.50 @ 18.50

GREENINGS IN DEMAND

Greenings, A Grade, 2½-inch and over, are in demand. In some instances higher prices are offered f.o.b. shipping point than the New York market, which was between \$5@6.50 per bbl. for A Grade 2½-inch last week.

Following were prices on other varieties September 13 at New York on New York State apples, A grade, 2½-inch, per double-headed barrel: Alexander and Wolf River, \$4.50@5.50; fancy \$5.25@5.50; Wealthy, \$5@6; Duchess, \$4@5; Fall Pippin, \$5@6.50, fancy, \$5.75@6. Bushel baskets: Wealthy, \$1@1.75; Duchess, \$1@1.25; Maiden Blush, \$1@1.50; Alexander and Wolf River, \$1@1.75; Twenty Ounce, \$1.50@2.25; McIntosh, \$1.50 @2.25.

EXPORT DEMAND FOR APPLES

The export demand for apples is especially active this fall. Quantities of fall varieties, as well as late summer apples, have already gone to British markets. Some fruit has been picked for export shipment too green ever to be of good quality. York Imperials from Virginia, for example, have been picked three weeks in advance of normal maturity of color and size and some are already on their way across the ocean. The fruit crop abroad is light. Kiefer pears are also in demand for early shipment, good, well-packed stock selling at \$3.75 bbl. f.o.b. shipping point.

CIDER MAKERS DISCOURAGED

Cider and cider vinegar manufacturers seem to be quite uncertain as to prospects for business this season. Some of the largest are hesitating to contract for cider apples because of fear that they cannot sell and ship cider, or make any profit on pure cider vinegar. The concerns that are extracting pectin from apple waste (pectin is a substance used for jelly-making) are able to make vinegar so cheaply that others cannot compete. Cider vinegar is now selling as low as 13 cents per gallon, which the manufacturers consider too low a price.

The Prohibition Law forbids shipping cider without preservative, yet the old-established cider dealers claim

that so much of it is being shipped without preservative in violation of the law, that their business is killed. A movement is now on among the larger manufacturers to secure a new uniform Federal vinegar law that will be more advantageous to those who make vinegar from juice of whole, fresh apples.

EGG PRICES REMAIN FIRM

In spite of the New Year holidays when the Jewish buyers were practically out of the market the price of eggs generally held firm last week. Nearby whites accumulated somewhat, but there was no price change. Total receipts of all eggs for the six days were 13,005 cases, compared with 24,947 cases the week previous.

BUYERS STOP PREMIUMS

As result of the vigorous action of the association of live poultry buyers, the old practice of paying premiums on fat fowls previous to the Jewish New Year, was completely wiped out this year. In the past these have amounted to as much as 8c per pound. There were no wholesale buyers on the market either Tuesday or Wednesday on account of the Jewish holiday. As a result, on Thursday, September 13, 92 carloads of poultry were on track to

small lots of Junes as high as 28c per pound. Fresh average run flats brought 26c per pound.

POTATO MARKET QUIET

The potato dealers in New York City last week seemed to be well supplied with stock. The large dealers and chain store buyers refused to pay more than \$1.31 bu., loaded, for Long Islands. On this basis the grower was getting \$1.25 bu. The Jewish holidays affected the trading to a very large extent as a great many produce houses were closed, some from Saturday until Thursday.

Later in the week the farmers refused to haul for less than \$1.30 bu. Shippers offered 150-lb. sacks at \$3.55 to \$3.65 f.o.b. loading point.

In the city some dealers, expecting lower prices, were delivering to the chain stores for prices ranging from \$3.75@4.

A few cars of Maine potatoes arrived. Carlots in bulk were being offered at \$2@2.15 cwt. delivered New York City.

LARGER POTATO ESTIMATE

The latest Federal crop estimates for September 1 show a gain of 10,000,000 bushels over the August 1 forecast,

13 up to \$16, while common to good lambs brought \$11@15.50.

Receipts of live calves were likewise light, but a light demand left prices practically unchanged. The receipts of country-dressed calves which have been very light became heavier on September 13. With cooler weather this tendency is likely to continue. Prime veals sold at 19@21c and choice at 22c per pound.

VIRGINIA POULTRYMEN FORM MARKETING ASSOCIATION

A committee of eight men from the South spent several days in New York City last week studying wholesale egg market conditions, preliminary to the beginning of shipments from a new co-operative association called the Virginia Poultry Producers' Association. This Association has a large membership in Virginia and will erect several central grading and packing plants. It expects to develop a large volume of uniformly graded fine quality eggs to reach the same class of trade as New Jersey and New York State eggs. They point out that they can ship in the late afternoon and have their eggs at New York the next morning and are really nearer the market than many other "nearby" sections.

F. N. Dixon of Richmond, Virginia, President of the Virginia Poultry Producers' Association, said that it was planned to form a southern federation of poultry producers' associations.

Lambs, common to good...	12¾ @ 13¾		
Sheep, common to good ewes...	3 @ 4¾		
Hogs, Yorkers...	9¾ @ 9½		

be sold with the market quiet and trading slow. Express receipts were fairly heavy, but prices remained practically unchanged from last week.

BUTTER CONTINUES UPWARD

The market for butter in New York City continued strong and there was a slight upward tendency. On September 13, creamery extras sold at 46½c and 93 score at 47½c per pound. During the two Jewish holidays, unsalted creamery which is used largely by this trade sold slowly, but later in the week the movement was more rapid.

The scarcity of lower grades of butter has caused buyers to scour foreign markets. Last week shipments were received from Ireland, Siberia, and Esthonia. Danish butter is not expected as the English trade is now paying a higher figure than can be realized in the United States after the 8c duty is paid.

In the first six months of this year Denmark shipped 2,382 tons of butter to the United States, compared with only twelve tons for the same period last year. In the same period Denmark shipped 44,474 tons to Great Britain.

CHEESE MARKET QUIET

The cheese market of last week showed more firmness especially on fancy stock. By September 13 the market was quiet again, with only light trading in state-whole milk flats. Some fancy sold at 26½c@27½c and

which brings the estimated crop for this year up to the average for the last five years, but still leaves it 62,000,000 bushels below the record crop of last year. Slightly larger production is reported in Maine and a few of the Middle Western States. The New York State crop is now reported at 29,813,000 bushels, which is less than was previously estimated, but about 8,000,000 bushels short of last year.

POOR DEMAND FOR HAY

There was very little interest in hay shown last week by buyers, partly on account of the Jewish holidays and the market generally was weak. Those boatloads of hay which were reported of very good quality sold out slowly at \$29 for No. 1 as the highest price, while considerable went at \$28 per ton.

CASH GRAIN QUOTATIONS

Cash grain quotations September 14, were as follows:

NEW YORK: Wheat—No. 2 red, \$1.16. Corn—No. 2 yellow, \$1.07; No. 2 mixed, \$1.06; No. 2 white, \$1.07. Oats—No. 2 white, 51c; ordinary white clipped, 50@53c. Rye—79½c. Barley, 77½ @ 78½c.
CHICAGO: Wheat—No. 2 red, \$1.02½ @ 1.03. Corn—No. 2 white, 88½ @ 89c; No. 2 yellow, 88½ @ 89½c. Oats—No. 2 white, 40½ @ 42½c. Rye—68½ @ 72½c. Barley, 57 @ 73c.

LAMB PRICES ADVANCE

With light receipts lambs showed a steady increase in price during the week, choice stock selling on September

The Factor of Intensity of Light

(Continued from page 191)

pens apply the general rule to each pen.

9. Let me advise again that the use of lights alone will not produce results. The method of handling and the use of light must be combined to get the profits which progressive poultrymen are enjoying.

LIGHT INCREASES OUR EGG YIELD

MRS. FLOYD OWEN

Perhaps it may be of interest to the many readers of the American Agriculturist who, like ourselves, desire the convenience of modern improvements on their farms to hear of the installation of our farm lighting system.

Throughout the summer we visited different places where plants were being used and read all articles we could find on this subject. We were particularly interested in the subject

can tell about how soon to disconnect the lights.

The lights are placed on a rafter and all wiring is through conduit. A 25-watt bulb is sufficient for a 10x10 coop. A 40-watt is sufficient for a 10x20 coop, and will light up a 12x24 if placed near the middle of the coop lengthwise and about five feet from the front of the coop. Some of the coops have switches in, but this is unnecessary as one can remove the bulbs if the coops are not to be lighted.

All barn wires are run through conduits and the lights, which are placed against the ceiling, are operated by switches. This puts the lights up out of the way and the switch, which does not cost much, makes it convenient to light the lamps or bulbs.

There are no switches in the smaller buildings, such as garage, milkroom, and wellhouse, a pull chain socket being used. The light over the engine in the wellhouse is suspended by a drop-cord long enough to allow the

Figure 2—A light of the same power as in Figure 1, but with a more abrupt reflector, which does not hit the perches, resulting in some of the birds remaining on the roosts

from the poultryman's point of view as we had a fine flock of 400 Single Comb White Leghorn hens and pullets in fine condition to make a good winter egg record.

The plant itself is placed on a good concrete foundation which extends into the ground about eighteen inches and is quite a little larger than the base of the plant. The battery cells are placed on two shelves at the back of the plant. Plenty of room should be left around the plant, especially at the back, for convenience in running and caring for both plant and batteries.

Each set of buildings is put on a switch of its own and the line to the henhouse and the one to the colony coops are separate wires from the main line that runs to the barn. This makes it possible to light or cut out any of these buildings at the house without affecting the current going to another. By pushing in the proper switches we light the henhouses in the morning about 4:30 and run until daylight, and at night from dusk until 6 o'clock. By feeding the hens at night (at about 5:30) more than we know they can eat, there is always some left for morning, and as soon as the lights are turned on the hens leave the perches and get busy in the straw to find an early breakfast.

Many eggs are laid before 6 o'clock and the hens are kept busy until 6 at night by feeding about five times a day. The increase in production has been very satisfactory. I have told of my methods in another story to the readers of our valuable paper. One of the henhouses has been recently whitewashed and we find this adds a lot to the effectiveness of the lights. We find there is no need of any dimming device as the hens will go to roost at night when they have eaten a good meal and by a few nights one

light to be taken to any part of the engine or pump where needed. We have two trouble lamps, one at the house, the other at the barn, which may be joined together if necessary. These can be connected with any socket and used wherever desired. A double socket is a great convenience as one can iron and have a light at the same time. There are many other conveniences that we expect to get from time to time, but the first will be a deep well pump with pressure tank.

We have nothing but praise for the farm lighting plant and hope these few notes will help someone to install their plant.

\$1.00 MORE PER HEN

The value of electricity in increasing egg production is well emphasized by the experience of G. W. Belden of Richford, N. Y. He has used his plant for three winters and knows whereof he speaks.

"We use thirteen 25-watt lights in our henhouse," says Mr. Belden, "in addition to lighting a ten-room house, also our barn and shops. As to the results of lighting the henhouse, as near as we can tell, we made about \$1 per hen extra the first year our plant was installed, which paid for the plant and all the wiring and fixtures. When we consider the extra eggs we get during the winter and the use of the power, we think we have made a decidedly good investment; for we use the plant for cutting all of our wood and for other uses around the farm."

Do not change the rations fed to hens suddenly. It will cause a check in egg production. Culling is of little value unless the hens are properly fed through the summer months.

DON'T BE EXTRAVAGANT!

It is always more economical to buy a product of good quality than to get a cheap thing. Buy one or two of the splendid animals consigned to the NATIONAL sale and

Help your MOULTERS MOULT

If you want your hens to moult naturally—

If you want them back on the egg job promptly—fall and winter laying—

Then you must make sure that your moulters are healthy and hungry.

They must eat lots, and be able to digest what they eat.

That's just what

Dr. Hess Poultry

PAN-A-CE-A

does for your moulting flock.

It's a tonic that begins with the appetite—improves a hen's whole system.

It has Iron that keeps the paleness away, makes the combs and wattles red—the blood rich.

Pan-a-ce-a starts the food the egg way as soon as the moult is over.

No time lost.

No dormant egg organs after the moult, where Pan-a-ce-a is fed.

Tell your dealer how many hens you have. There's a right-size package for every flock.

100 hens, the 12-lb. pkg. 200 hens, the 25-lb. pail
60 hens, the 5-lb. pkg. 500 hens, the 100-lb. drum

For fewer hens, there is a smaller package.

These groups of stockholders illustrate the rapid growth in ownership of the Bell System.

A Community of Owners Nation-wide

"Who owns the company?" "What is behind it?"

These questions are asked in appraising the soundness of a business and in determining its aims.

The American Telephone and Telegraph Company is owned by more than 270,000 people living in every state in the Union. Could the stockholders of the Bell System be gathered to one place, they would equal the population of a city about the size of Providence or Denver.

They constitute a representative cross-section of American citizenship. Among them, of course, are bankers and men of large affairs; for the idea of ownership in the Bell System appeals to sound business judgment and a trained sense of values.

In this community of owners are the average man and woman, the storekeeper, the clerk, the salesman, the professional man, the farmer and the housewife—users of the telephone who with their savings have purchased a share in its ownership. The average individual holding is but twenty-six shares.

No institution is more popularly owned than the Bell System, none has its shares distributed more widely. In the truest sense it is owned by those it serves.

Try This Remarkable Engine FREE

There is no other farm engine like it. Simple in construction and easy to operate. It is only one engine, yet it takes the place of six engines. It will give from 1½ to 6 H. P., yet it is so light that two men can carry it easily. Set it anywhere and put it to work.

Change Power as Needed

It is a 6 H. P. when you need 6, or 1½ H. P. when you need only 1½, or any power in between. Fuel consumption in proportion to power used and remarkably low at all times. Adjustment from one power to another is instantaneous.

Burns Kerosene

Operates with kerosene or gasoline. Easy starting, no cranking. The greatest gas engine

value on the market. And you can prove all of these statements to your own satisfaction.

What Users Say

Ivan L. Blake, of Hannibal, New York, says: "Only engine economical for all jobs. I run a 28-inch cord wood saw, a 24-inch rip saw, a washer, a pump, and a grinder, and it sure runs them fine. It has perfect running balance, and it sets quiet anywhere."

Clarence Rutledge, of Manitoulin Island, Ontario, says: "Have given my Edwards four years' steady work and like it fine. It uses very little fuel. I run a 28-inch cord wood saw, also a rip saw, 8-inch grinder, ensilage cutter, line shaft for shop, churn, washer, separator and pump. Have had ten other engines and the Edwards beats them all."

Frank Foell, of Cologne, New Jersey, says: "It's a great pleasure to own an Edwards engine. I run a wood saw, cement mixer,

"I set out to build a farm engine that would have every feature the farmer wanted and none he didn't want. It has now been on the market six years. Thousands of satisfied users tell me I've succeeded. I'm proud to have this engine bear my name."

The School Bill and The Farmers' Taxes

The Negro in Southern Agriculture

How a Boy from the Farms of Dixie Views the Greatest Problem of the South

By L. B. PRYOR

COMING from the South and a part of the country that is almost primitive in its methods of farming in comparison with yours, I should indeed feel embarrassed if it were my part to tell you how we farm with the idea of improving yours.

I was born and raised on a farm in the State of Tennessee and have lived there all my life with the exception of three years that I have spent at Cornell. It has been a revelation to come here to study agriculture and to see the great strides you have made along these lines and I can see now as never before that we of the South who are engaged in farming can be materially benefited if we are only willing to admit our backwardness and to accept instruction from you who are much further advanced in the school of farming. Knowing by now that I am from the South you are perhaps wondering just how I am going to treat my subject. Having lived among and associated with negroes all my life I have learned to love them and to know that there exists among the most of you a great misunderstanding as to how we of the South feel toward the negro.

To my mind the negro problem is and always has been an agricultural one and it is my aim to show to you that the success of southern agriculture in the future is dependent upon an intelligent treatment of the negro race.

In order to understand more fully the place of the negro in our southern agriculture of the present as well as the future, it will be well to review briefly with you the history of the negro race in this country.

The first negroes were brought into this country as slaves and were sold to the New England colonists who used them for domestic servants. During the colonial period and down to the changes initiated by the invention of the cotton gin, negroes were distributed with some evenness along the Atlantic coast. Between the date of that invention and the civil war and largely as a result of the changes the cotton gin set in motion, the tendency was toward a concentration of the negroes in the great cotton growing area of the country. Negroes were found to be especially adapted to the climate and outdoor life that is associated with the growing of cotton, and now after they have had fifty years of freedom, nine-tenths of them preferred to remain in the southern States.

The far-seeing men of their time realized that the institution of slavery was wrong and a bitter civil war was fought to settle the issue. I am confident that the men in the confederate army were fighting for what they thought was right and for a good many years southern people thought they had been done a great injustice. Now that sectional differences and hatred have passed away I am sure that the southern people are glad that the confederacy lost and under no conditions would they want slavery again.

Over fifty years have passed since the Civil War was fought, yet slavery still casts a shadow. The South is backward not only along agricultural lines but in industry, thought, customs and manners.

At the end of the Civil War the negroes were freed, but I am sorry to say only in the sense that he no longer had allegiance to pay to a master. Picture him if you can without land or property of any kind, ignorant and poverty stricken, nothing of the past to cherish and with but little hope of the future. Slavery had not been kind to family life and he had not even the love of the fireside.

Did he sit down and wait to be fed by those who freed him or did he seek to destroy those who had formerly been his masters? No. He quickly realized that his success would come by beginning at the very bottom on the land and in the country where he had been found to be best adapted. There was a great temptation for the negro in the radical change from slavery to freedom to overlook the fact that he would be able to live only by the production of his hands and that prosperity and happiness were his if he only glorified and put dignity and brains into the every day occupations of life.

The greatest problem in connection with

From a Southerner's Standpoint

IN a recent issue we published an article entitled, "Hens Can Pay Dividends By Sitting?" by William A. Flanagan, who won the first prize last winter in the Eastman Public Speaking Contest held annually at the New York State College of Agriculture.

On this page we are printing the second prize in the same contest. We thought it would be particularly interesting to our readers because it is written by a farm boy from the South, and because recently there has been a great exodus of the negroes from the South to our northern cities.

southern agriculture is the question of labor. This is due to the large size of the farms and the kind of farming practiced. Since the time of the invention of the cotton gin, the South has been largely dependent upon the growth of cotton. The South is in good spirits when the price of cotton is up, but they never seem to make any preparation for the future and one bad year throws them entirely upon the mercy of other parts of the country. A great part of the land is either rented or worked on the share crop basis, and the negro who is tenant is not allowed to grow anything else. They know how to grow cotton and nothing else, and such a thing as diversified farming or the rotation of crops is unheard of. The farmers of the South do not even grow enough vegetables to eat and it is only the large landowner who is fortunate enough to have a cow and some chickens. There is not the appearance of permanent farming that you have here, and if there are any of you who think you are having a hard time I would advise you to take a trip through the cotton belt.

We of the South have gone through an experiment of about fifty years in the handling of negroes, and we are just beginning to realize that our treatment of him has been along the wrong lines. We have thought to better ourselves by keeping the negro in ignorance and poverty, not realizing that he would either constitute one-third of the ignorance and crime of the South or one-third its intelligence and progress.

The negro was introduced in the South because of his particular fitness to the climate and I do not believe the white man is capable of doing as much work in a day under that hot sun as the negro. Southerners have a reputation of being lazy that is not wholly unwarranted, and I think that if many of you spent the summers there you would be following the shade around the tree like the rest of us.

Because of the unfair treatment that he has received and because of a lack of an equal chance of advancement, the negroes have almost deserted some of the best agricultural sections of the South. Surely the negroes cannot be blamed for leaving, but

it is an unfortunate state of affairs all the way around.

The white men of the South who are looking towards the importation of those of foreign birth, strange tongue and habits to replace the negro are making a grave mistake, and are taking a backward step when they expect the scum of Europe to make successful tenants and good citizens.

We of the South have failed to appreciate the true value of the negro and it would be well to consider for a moment his record of the past. The negro race has proved beyond a doubt that they are trustworthy, honest and law abiding. In the Civil War when the South was fighting to keep them in slavery, did they take up arms against their masters? NO. They stayed at home to till the fields, to look after the women and children, and many even followed their masters to the field of battle. Could we expect more of any people? They have cleared our forests, tilled our fields, and builded our cities without strikes or labor wars, and are we now going to show our appreciation by driving them out of the country to make way for a foreign element that will do nothing but stir up strife?

Perhaps you wonder just what the country negro of the South is like. Of all classes of negroes he is the most likable and by far the easiest to get along with. He is the most picturesque character imaginable and taken as a whole they are the happiest people on earth. Over 75 per cent of them are in the tenant class and they live from year to year in their little two-room cabins seemingly contented with only the essentials of life. They are generally very ignorant and because of this they are kept in poverty. They do not grumble about work and it is certainly a pleasant sight to see them coming from the field with a song on their lips.

I know that there exists in the North a common belief that the southern white man hates the negro, and if I do nothing more than show you that this is wrong I will be satisfied. In the rural sections of the South there is a great warmth of feeling between the white man and the negro and I was interested to read of an incident that happened in Congress the other day, when a southern congressman moved to have a statue erected in Washington in honor of the old Southern mammy. In my own family we had a negro mammy that lived with us for twenty years, and when she died there were more white people present than negroes, because everyone that knew her loved her. It has never been my privilege to know anyone who lived a better life or was more thoughtful of others.

The question of social relationships always arises when the negro question is discussed. Booker T. Washington, one of the greatest members of the negro race, forever decided this issue when he said: "In all things that are purely social we can be as separate as the fingers, yet one as the hand in all things essential to mutual progress."

It is true that in many cases the negro has been deprived of the right to vote and rarely has been able to vote intelligently. It is our duty to prepare him and give him a chance to participate in his government.

The greatest need of the negro in the South to-day is education. We of the South have thought that education would make the negro dissatisfied and unfit for work. It seems impossible to teach us that the educa-

The School Bill and The Farmers' Taxes

Equalization and More State Aid Would Reduce Burden in Many Districts.

IN our last issue we promised an explanation of the effect upon farmers' school taxes if the School Bill, which was before the New York State Legislature last winter, should pass.

In these times when the farmers are taxed for everything almost beyond their capacity to bear, they have a right to know what effect any new proposal will have on their present tax burden. We believe that farmers are more willing to pay school taxes than other forms of taxes, knowing that the welfare of their own children and the future of America itself depend upon good schools. But at the same time, willingness to pay the school taxes must rest upon being sure that value is received in better schools for every dollar of tax paid. In too many instances now under the present law a farmer does not get full value for his school taxes, and there is much dissatisfaction, which is fully justified, about school taxes in hundreds of farm communities in New York State.

Costs Differ for Same Kind of Schools

One of the causes of dissatisfaction and criticism from a tax point is the great differences in cost of maintaining district schools in different parts of the same county and in different parts of the State. For instance, for the year 1920, there was one school in Delaware County that cost somewhere between \$675 and \$699 to run; while in another common school district having no more advantages than the first, the cost was between \$1,425 and \$1,449, or more than twice as much. In Tompkins County, for the same year, the cost in one school district was between \$600 and \$624; while in the same county another school, no better than the first, cost from \$1,100 to \$1,124. In Monroe County, the cheapest school was maintained at a cost of from \$775 to \$779; while there were three other district schools which cost over \$1,500 each. Throughout the entire State, neighboring districts differ greatly in the cost of maintaining practically the same school facilities. Even when no account is taken of the cost of repairs, it is frequently found that one school will cost from one and a half to two times as much as the school in the adjoining district.

Getting at it from another angle, and putting the differences of cost on a pupil basis, i. e., comparing the cost of one year's schooling for one pupil, it was found in Delaware County that it cost eleven times as much in one district per pupil as it did in a neighboring district. In another section of Delaware County, it cost thirty-three times as much to educate one pupil for one year in one of the schools as a pupil cost in another nearby school.

There are two chief reasons for these great variations. The first is the difference in the number of pupils. In many cases this

cannot be helped because there are many schools with few pupils that could not consolidate on account of bad roads or weather, or some other cause. The second cause for differences in cost of maintaining the same kind of schools is the difference in efficiency in handling their business affairs.

While many rural school districts make the keeping down of the tax-rate the chief object of their administration, the measures taken to make an economical expenditure of the money spent are faulty. This is proved by the replies made to certain questions by 128 district superintendents and 944 school directors scattered throughout the entire State. Budgets are not prepared in 50 per cent of the districts and in only one-half of these cases is the advice of the district super-

tions are about one-twelfth that of the wealthiest district in the county. In Erie County, there is one district which has a valuation over sixty times as much as any other district. In Clinton County, the highest valuation of one district is over seventy times that of the lowest. Putting it in other words, in these districts mentioned, it is from thirty-four to seventy times easier to maintain the same school facilities in some districts as in others. These examples may be rather extreme, but every farmer can think of cases nearly as bad in his own county.

To overcome these inequalities in taxes, and to give rural school patrons an opportunity to improve their schools, without adding greatly to their tax burden, the Rural School Bill contains two important school tax provisions. It provides first, for more equalization of the tax rate and second, for much more financial help for the rural schools from the State. Of this help from the State for Rural schools the cities will pay 87 per cent.

Would Equalize the Taxes

As we explained in last week's issue, the bill contains a provision for establishing a community unit for administration of the schools and for taxation purposes. The common school districts which would make up the community school district will be left as they are, unless the people in these dis-

tricts, should themselves vote to unite with some other school or schools—understand that, "unless the people in these districts should themselves vote to unite." But the bill provides that the larger community district would be the unit of taxation instead of the common school district and the local tax rate would be worked out on the larger community unit instead of on the property in the smaller school district as at present. This plan would then equalize the taxes in all of the districts in the community unit and there would no longer be adjoining districts which would have such absurd differences in tax rates for the same kind of schools as now exist.

More Help From the State

This equalization also is absolutely fair and right because it would cause the larger, wealthier districts to divide or share their taxable property with the poorer districts back on the hills. At the same time, it would not greatly increase, if it would at all, the taxes of the residents of the wealthier districts, because all of the districts, both rich and poor, would get more help to support their schools from the State.

The second tax provision in the proposed bill, is that of more State aid for the support of rural schools. If the bill should pass, something over ten million dollars more State aid would go for the support of the

(Continued on page 214)

Reserve Judgment

HERE is another of the explanatory articles on the proposed School Bill. If you are interested in the school problem from a tax standpoint, the facts here set forth may contain a surprise for you. After you read this, save it and give it to a neighbor, or better still, have it read out loud at your Grange or other farm meeting.

More of these explanations will follow. We hope that you will reserve judgment either for or against the bill until you have had time and opportunity to study all the facts.—The Editors.

intendent obtained. Supplies are purchased as needed from local stores in 90 per cent of the districts, and at regular retail prices in practically all districts, instead of purchases being made at one time and in quantities which would secure wholesale prices. As a result, supplies cost 20 per cent more than they should. Again, taxes are not collected promptly in three-fourths of the districts, and the moneys so received are, in but few cases, placed on deposit in banks at interest—thus losing two or more per cent on the amounts in deposit.

How Tax Rates Vary

Now let us see how the farmer's tax rates vary in different districts, for after all, that is what he is particularly interested in. In order to compare the tax rates in different districts, it is necessary first to get the equalized valuations of the property, for all of us know assessors may assess property 50 per cent of its true value in one district and 75 per cent of its true value in another. It is possible, however, to get the true valuations in the different districts through the records of the State Tax Commission and the following statements are based on the true valuations so that they are fair comparisons.

In Delaware County, there is one district that has an equalized valuation per teacher approximately thirty-four times as great as four other districts that have the same educational advantages. In Tompkins County, there are three districts whose true valua-

A Fairly Good Fall

PROFESSOR G. F. WARREN of the Farm Management Department of the New York State College of Agriculture in a recent report said:

The price outlook for many New York farm products this winter is better than at any time since 1919. Milk, butter, chickens, wool, lamb, beans, cabbage and potatoes are already bringing good prices. Probably buckwheat will rise because of the short crop. Hay is cheap, but is likely to rise to some extent. Hogs are very cheap and the supply is so large that no material advance in price is to be expected this winter. Beef and veal are low in price, as are all the grains.

In discussing the milk situation, Professor Warren says:

The earnings of factory workers are more than double the pre-war rate so that the demand for milk is very strong. Even if prices continue to decline, it is probable that this strong demand will continue for the winter and probably for the year. The pool price for milk in July was 77 per cent above the pre-war price. * * * The weighted average price of farm products in the United States for July was 34 per cent above the pre-war price and the weighted average price of farm products for all New York State products was 57 per cent above the pre-war price.

These last figures show that the New York prices are much above the general average for the whole nation and milk is still further above the New York average.

Prices for potatoes this year will probably be very good, concerning which Dr. Warren says:

Last year the acreage of potatoes was high and the yield per acre was high, so there was a great over-production and prices were low. This year the acreage was reduced and the weather has been unfavorable. The United States crop of potatoes for 1922 was 451,000,000 bushels. The August forecast for this year is 380,000,000 bushels. On August 1, the New York farm price of potatoes was 82 per cent above the pre-war average.

The same situation applies to cabbage. Prices as high as \$80 a ton have been mentioned.

The drought, labor shortage, and other factors have reduced the acreage of most New York State products and the production per acre. Never have we forgotten the boyhood lesson obtained in raising potatoes on shares that it was better to have a moderate

or even a poor yield and get a good price for them than to have a big yield and sell them for 15 to 25 cents a bushel. Crops are not particularly good in the East this fall and for just that reason most farmers will have financially the best year in some time.

When Is a Farmer Not a Farmer?

A FEW weeks ago a farmer was talking rather excitedly to another farmer on the old subject of the difference between farmers who work on the land and those who leave the land to do something else. The first farmer made the emphatic statement that the moment a man left his land, no matter for what purpose, he ceased to be a farmer.

The second one said: "You believe it is true then that a doctor can go, say to the State Legislature and still be a doctor, a lawyer can represent his district in the Legislature and still be a lawyer; but a farmer who becomes an Assemblyman or a Senator is no longer a farmer?"

"Yes, sir," said the first man. "That is true. The only person qualified to speak for farmers or to act for farming is the man who is actually farming with his own hands."

In other words, this first farmer sincerely believed, and there are evidently many others who agree with him, that the moment any farmer leaves his farm to become a member of the Legislature or Congress, or an elected officer in any cooperative association, he then changes his whole nature and forgets all of the former and chief interests of his lifetime to become some strange selfish creature to be carefully watched, criticized and seldom supported.

This feeling of distrust and lack of confidence has done more than any other one thing to hold up the progress of farm affairs, to make the farmer the butt and the victim of all other classes and to keep him from obtaining his rightful place in the social, economic and political life of America. Other classes have worked in groups and organizations and until recently the farmers were unable to stick together and have worked as individuals who were helpless against the powerful organizations on every side of them.

When the cooperative movement first started, the middlemen's chief weapon to break up the organizations was to spread the propaganda among farmers that their leaders had "sold them out." For long years this propaganda succeeded. Whenever a cooperative creamery, for instance, gave evidence of becoming a real competitor of the milk dealer, the dealer got busy with his whispering and spreading of distrust and lack of confidence among the members of the cooperative and one by one they deserted. The time came, however, when farmers got wise to this old, old game, and learned how to stick through thick and thin. From the day that they saw the absolute necessity of standing together and supporting their own elected leaders, the cooperatives began to succeed.

But recently farming has been through a period of mighty hard times. Farmers have been discouraged and certain interests have seized this period of discouragement as an opportunity to revive again the old propaganda against farm cooperatives and their leaders. Farmers are being told that there is a "line up" of insincere farm leaders on one side against the plain farm folks on the other. They are told that they are "being dominated"; that the farmers have nothing to say about their own organizations; that measures are being "put over on them" against their consent; and many other statements equally absurd but deadly, pernicious and dangerous because they strike at the very roots of the whole cooperative move-

ment. It is the old "sold them out" propaganda, a little more cleverly told, but all the more dangerous because it is clever.

As long as human nature is human nature, there will be leaders who will make mistakes. Undoubtedly, there will be some, too, who will do wrong, and there will be those whom the farmers will need to change from time to time; but it is a mighty sight easier to take a critical and destructive attitude toward men and their works than it is to give them constructive support. It seems somehow to be easier for some to believe the dealer and the demagogue, than instead of the leaders whom the farmers have themselves elected.

But times have changed, and while there may be a minority who will always respond to destructive forces and suggestions, we have faith in the majority of modern farmers to believe that they are doing their own thinking and that they are taking a constructive attitude toward their business, their organizations and their leaders. Most of us have learned by sad experience that farmers must work in groups and in organizations—and that organizations like armies without well-supported leaders end in defeat.

The Editor's Chestnuts

MR. MORGENTHAU our publisher says that farmers get tired of being serious and appreciate a good joke better than most folks; therefore, American Agriculturist ought to have something funny in it. I fully agree with him. But it is hard work to be really funny. There was only one Mark Twain, you know, and there are only about a half dozen original jokes anyway. All of the others are just variations of the original. I have noticed that many a joke when told orally has a real laugh in it, but falls flatter than a pancake when you try to write it down. But just the same, we are going to be funny a little every week, so if you know or hear of any stories, particularly farm stories, that make you laugh, may be they would make thousands of other farmers laugh if we passed them on, so send them in.

Perhaps some of them will make more of a hit than I did one time when I tried to be humorous up in Delaware County, New York. It was back in the days when there was constant trouble between the Dairyman's League, for which I was working, and the milk dealers. Every time the word "milk" was mentioned, it seemed to be the signal for a nice little row, either in the country or in the city. I got so I was almost ashamed to look a glass of milk in the face.

Well, I was called on to make a talk at a big farmers' meeting in Walton. The speaker before me was from the Home Bureau and gave a very nice explanation of the different elements like butterfat, milk solids, salts, etc., that milk contains.

In beginning my talk, I complimented the lady upon her clear explanation and then attempted to be funny by saying that the preceding speaker in naming the different parts that composed milk had omitted to mention the chief one of all—which was dynamite!

I paused to give the people a chance to laugh, or at least to smile, but there was a long and embarrassing silence with nary a laugh—as usual when I tell a story, no one had gotten the point, just as you have probably failed to get it now after you have read it, because I cannot make it clear.

The County Agent of Delaware County was present at the meeting and the fact that my story had fallen flat was a huge joke to him. He told of it later at county agent gatherings and out of the circumstance came the question asked among my friends from one end of the State to the other: "When is a joke not a joke?"—to which the answer is, "When Ed. Eastman tells it!"

Eastern Apples To Come Into Their Own

New York Fruit Show to Emphasize Eastern Products—A Radio Talk

THE Eastern Apple Exposition and Fruit Show will be held in Grand Central Palace, New York City, November 3 to 10. This exposition is going to be held because one New York City man tried unsuccessfully for two years to buy an apple grown in New York State. Being of an inquiring turn of mind, he called a meeting of representative fruit growers and officials of various horticultural societies and members of State departments of agriculture to find the reason for this condition. That meeting was well attended and this apple exposition is the result.

The exposition will occupy the entire third and fourth floors of the Palace, covering nearly one and one-half acres in area and be participated in by the New England States, New York and all of the other eastern apple producing States as far South as Georgia, either officially or by large exhibits from individual growers.

The fourth floor will be overflowing with the products of the orchard and vineyard, with bees and their product in infinite variety and with maple products. One of the most striking features on this floor will be a beautiful bank of vari-colored apples harmoniously arranged from the New York State Experiment Station located at Geneva and containing specimens of all the leading varieties of apples grown in the eastern States.

The Home Economics Department of Cornell, will show a large assortment of canned fruits, jellies marmalades and other preserved fruits. An expert will be in constant attendance to explain just how this work is done. This exhibit will be in charge of Miss Brewer.

Demonstrations in preparing apples in different ways will be carried on under the supervision of Miss Van Arsdale of The Teachers' College of Columbia University. Printed recipes showing how these foods are prepared will be distributed. To demonstrate the way apples are graded, sized and packed, an apple grading machine will be used and apples will be sized, graded and packed during the exposition.

Apples will not be the only fruits shown. There will be grapes, peaches and pears. A strawberry bed filled with red luscious ripe berries will be a decided novelty. Strong competition is developing among the different States and many novel and striking features will be introduced.

Hundreds of barrels of apples will be given away and every boy and girl admitted to the show will receive a supply. Some of the largest manufacturers of cider will press the juice from the apples and give it to all who desire it. Sweet cider is an important by-product of the apple-growing industry and its consumption should be largely increased.

During the exposition the annual convention of the American Pomological Society will be held. This is one of the oldest and most important societies of its kind in the United States. Its president is Dr. Liberty Hyde Bailey who was for many years Dean of the New York State College of Agriculture and is an authority on things pertaining

By T. E. CROSS

Member of Executive Committee of the New York State Horticultural Society

to agriculture. A very interesting and instructive program has been prepared for this convention and special rates will be given by the railroads to all who attend.

On the fourth floor will be continuous moving pictures without extra charge, illustrating every part of the work necessary to produce fancy apples, including picking and packing. On the third floor will be the trade exhibits. There will be shown everything in spray machinery, dusters, fruit packages, picking ladders, chemicals used in spraying and dusting, cider-mill machinery, nursery stock and a full line of tillage implements, trucks and tractors.

Not so many years ago New York was the banner apple producing State in the nation not only in quantity but in quality as well. During the past few years the Pacific Coast States have increased their production of apples to such an extent that Washington is a close competitor of New York.

Owing to the great distance from large markets, these Pacific States have been compelled to grade and pack their fruit with extreme care, as the high freight costs prohibits shipping anything except perfect fruit. Because of superior grading and packing and world-wide advertising and not because of their superior flavor, western apples have very largely monopolized the fruit-stand trade in our eastern cities.

The eastern apple grower of to-day is producing the best apples grown in the world. He is standardizing his pack so that a buyer when selecting a recognized standard brand will be sure to get what he pays for. There is no apple in the world to compare

with our eastern grown McIntosh and Spy for dessert nor with our R. I. Greening, Twenty Ounce, and Baldwins for cooking.

There are many thousands of people in the Metropolitan district of New York and other cities who never tasted an eastern grown apple and this exposition will give these countless thousands a wonderful opportunity to see and to eat of these beautiful apples, the best fruit God ever gave to man.

Fruit in the Medicine Chest

E. L. VINCENT

IT sometimes costs dearly to learn a very simple lesson. It was so in our case.

Fruit had been scarce all summer in our locality. The crop is not usually a failure with us, but that year it was. We did not think much about it. There were plenty of vegetables and other good things to eat, so why worry because we did not have fruit? The time came when I wished I had done a bit more worrying beforehand; it would have saved my worrying afterward.

Wife began to get yellow in the face. The very whites of her eyes had that color. When we went to church or attended any similar gathering, it was hard for her to keep awake. If we had had our wits about us, we might have known that she was dreadfully bilious. As it was, we thought little about it and did nothing whatever to counteract the evident tendency toward a sick spell.

Along the forepart of November we made a trip up into the country to see wife's father. We rode in a carriage, and on the way an early snow storm came on beating directly into our faces for several miles. Not being well prepared for such a storm, wife had on a pair of gloves that did not cover her wrists very well.

The result was that she took cold that day. That night she seemed to be frozen to death. She hovered over the register, but could not get warm. One of her ankles began to pain her. It was swollen, and although we began to do everything we could to relieve the pain, the next day we called a doctor. The pain had spread so that almost all parts of her body were affected. That was the end of her sitting up for months. At Christmas time she was a little better, so that the boys got her into a chair and brought her downstairs at dinner time. But such misery as she did suffer! At times she could not bear the weight of the thinnest sheet on her body without groaning. It was only when warm weather came the next year that she was really able to sit up a little while, and then she had a bad heart trouble. The story of how that was cured is not to be told just now, although it is very much worth while.

But the thing that we learned from this unpleasant experience was, that never again should we be without fruit. I am just as sure as I am of anything that if we had had plenty of fruit before this sickness came on, wife never would have been compelled to suffer as she did. Now we have fruit of some kind every day, and many times a day, as the appetite demands. It may

Why You Should Vote

Do the American people want prohibition? The Wets emphatically say "No" and the Drys are even more emphatically for it. Both sides claim a majority. Which is right? What do farm people think about it? The opinions of farmers on any problem, if they will express them, go far in determining the outcome of a controversy.

American Agriculturist is taking a vote of farm families on the question of prohibition. It is a vital issue and whether you are for it or against it, be sure to vote in the spaces above. Mail this ballot to the American Agriculturist, 461 Fourth Avenue, New York City.

The Stranger Within Our Gates

A Slightly Different Viewpoint on the Immigration Question

By J. VAN WAGENEN, JR.

I CONFESS with some regret that I do not feel that I can really agree with what is probably the dominant public opinion relative to the question of the limitation of immigration. Of course I readily admit that we are

J. VAN WAGENEN, JR.

under no obligation to hold ourselves open as a mere dumping ground for the insane or criminals or incapable offscourings of other lands, but I do feel that our so-called three per cent law is not only a singularly wooden and unscientific measure, but that it bars out a great number of folks who ought to have an opportunity to seek for better things and who in the end would be a great asset and not a liability to our national life. I suspect that down in my heart my position is determined by the same sort of sentiment that I heard expressed only the other day. I was at a Farmers' Picnic and there met a Congressman with whom I had a pleasant half hour, leading him to talk of the Eighteenth Amendment (the most discussed and interesting topic of to-day), the Farm Bloc in Congress and the immigration question.

Now if there be in America any such thing as aristocracy in the very best sense of the word, then this man represents it because his is a proud old family name which literally for generations has been prominent in financial, civic and political life. His declaration was this: "Eight generations ago my ancestors emigrated to America for the purpose of bettering their condition and I find it very hard to shut the door in the face of any other man." I feel that it is logically pretty hard to escape his position. When you get right down to the facts, it was the disappearing Red Man—Poor Lo—who first strenuously opposed the open door and he lost out in his contention.

The general topic is especially suggested to me at this time because I have just finished a few days of appraisal and inspection work for the Federal Land Bank, which has brought me into rather intimate contact with quite a number of our foreign-born citizens. As a matter of fact the foreigner is far more apt to seek the help of the Land Bank than is the native, because he is familiar with similar institutions on the other side, while the idea is relatively new here. So there are a great many unpromisable Polish and eastern European names on the roll of the Land Bank.

When you have walked with a man or woman over their fields and have discussed with them at considerable length their problems and plans, you are really getting acquainted with them in a sort of intimate fashion and I have done this for a dozen Poles and Italians within a few days. What I have learned has made it increasingly hard to me to subscribe to the doctrine of "America for Americans." I find it rather easy to judge them with a certain charity. We must remember that they have come to us from lands where there have never been opportunities in the American sense and where every one except a very limited hereditary social upper caste has been ground under a bitter poverty such as we in this happier land are strangers to. They bring with them many survivals of their environ-

ment and traces of the hard lot from which they are escaping. Some of their homes are squalid enough but they are on the way up. I have seen Polish kitchens that looked clean and meals that I feel sure I would enjoy.

It is true that in many ways their customs and manners are repugnant to us. Doubtless in his way and according to his light, the Pole loves his wife, but our ideas of chivalry are not his, for frequently he works his women folk bare-footed in the fields in a way that we do not like to think about. So too, he works himself incredibly long hours careless of weather or hours or the Sabbath Day. I grant that he brings manners and customs and ideals less refined than the man who has a background of three centuries of America behind him.

Now I have more confidence in the miracle working power of our famous "melting pot" than many profess to have. I know that the daughters of these mothers—the little girls who to-day are in public school will not work bare-footed in the fields. I know the boys will learn of a ten-hour day. I know that the grandchildren of these

The Over-worked Melting Pot

MR. VAN WAGENEN has approached the immigration problem in his article on this page in such a kind and logical way that it is difficult to disagree with him. So we are not going to try. Anyway, we agree with what he says for the most part. For instance, we agree with his thought that the present immigration law is a "wooden law" and works many hardships upon the "strangers" who try to enter our gates. Without doubt, in time the immigration law will be amended and changed so as better to meet the many problems of limiting the great overflow from other countries. As a nation we have had little practice in restricting immigration and it is to be expected that we would make many mistakes when we first start.

We, of course, also agree with what Mr. Van Wageningen says about us all being immigrants once and about the fine people who have recently come to our shores and to our farms, who are making such a splendid effort to become good Americans. America has always been a land of opportunity for the oppressed and down-trodden of other lands, and just because we want it always to so continue, we think care should be taken not to let in so many "strangers" at one time that they cannot be made quickly into American citizens.

Our country stands, as it always has, for certain fundamental principles such as democratic ideals, the speaking of the English language, the education of children, and the high standard of life and living in our family. When the proportion of immigrants become so large that we cannot quickly get them to absorb these principles, then there is real danger that the "United States of Americans" and all that they stand for will cease and will become instead the "Un-united States of Europeans."

Therefore, we are not opposed to admitting the "strangers," but we are opposed to taking them so fast that we cannot pass them through the melting pot of our customs, institutions and principles and turn them out American citizens. With this we are sure Mr. Van Wageningen will agree.—The Editors.

folks will act very much like yours and mine and will mate with them in wedlock. There are Polish families now in the Connecticut Valley far enough advanced so that I personally know of their intermarriage with fine old families of the native stock and moreover nobody appears to be greatly scandalized thereby.

Then too, I hold to the doctrine that perhaps these so-called inferior races may have some genuine contribution to make to our national life. Many readers of the American Agriculturist who have attended Farmers Week at Cornell will remember Mrs. Rose Morgan, that sweet singer of simple songs who has done so much to bring an appreciation of worthier music to our farm people. I have heard Mrs. Morgan say that the Italian was bringing to America a great gift in the way of musical instinct and the love of melody and song. So I am asking if it is not possible that these eastern European races are making a contribution of physical vitality that is also worth while.

Some social studies among the New

England States seem to indicate that the Puritan—the element that Oliver Wendell Holmes very happily called "the Brahman Caste" of New England tends to disappear because it no longer maintains itself numerically. The Puritan was a wonderful race, but a glorious past avails him very little if as a class he "dies at the top," a fate that seems to threaten the most highly civilized peoples. Our highly-trained, intellectual, ultra refined classes exhibit this tendency and our very national perpetuity may depend upon a constant infusion of blood from below—from the less highly organized but more vigorous folk that we complacently designate as the inferior races.

The other day I was piloted over the fields and through the woods by a Polish woman, the mother of a great brood of lusty children who by virtue of birth on our soil are free-born American citizens. She walked with the strong, swinging stride that bespoke perfect physical health and vigor and she said there was no farm task that she could not do. I presume she does not belong to the New Century Club or the Monday Afternoon Bridge Circle, nor has she yet read "Main Street," but she was loud in praise of her husband

who works eight hours a day or night in the paper mill, and then comes home and works eight hours more on the land. Unquestionably they are on the way up and will make good if only no disaster or accident or disease overtakes them. The man reads English, slowly and painfully perhaps and to my surprise and pleasure he subscribes to the Agriculturist and charts his agricultural course by its directions.

When I remember these folks and their happy optimism and cheerful smiles and warm handshake at parting, I am glad that they passed through Ellis Island before the days of the three per cent law.

Now what I have just written must not be construed as a challenge to joint debate. I am sorry that in this particular I cannot agree with what seems to be dominant public sentiment and I believe the conviction of the editors. I suppose the reason is that I have such unbounded confidence in the "melting pot" or call it the digestive capacity of America if you wish. I find it easy to believe that these people who come to us, nearly always out of dire poverty and very frequently from dense ignorance, if given opportunity and encouragement and social justice and shelter beneath our beneficent Democracy are going to be about like the rest of us in three or four generations.

Still, I recognize this—that the alien in the raw is not always a desirable addition to the rural neighborhood. His culture and his social and ethical standards are not ours. Moreover he is not infrequently an invincible business competitor—not because he is a better or even as good a farmer as the native, but because of his willingness to accept a low standard of living and to work himself and mate and brood to unbelievable hours. When he invades the rural community in large numbers he makes hard going for the old Protestant church and it is hard for him to be received or to be willing to enter the old social life. I recognize all this and I can see why it is often not easy to welcome the newcomer. There are parts of Sullivan and Ulster Counties where the Jew has almost displaced the old native stock, just as there are localities in the Connecticut Valley where the Puritan has given place to the Pole.

Nevertheless, for good or for ill, whether we like it or not "it is a con-

(Continued on page 214)

Is Fall The Best Time To Set Trees?

Labor Shortage May Alter the Time to Plant the Young Apple Orchard

THE eastern farmer inclined to fruit growing is confronted at this time of year with the question of setting an orchard—or more orchard, and especially whether he shall go about it in the spare time of Fall, or risk getting this work done in the rush of other Spring work. Probably he has already let several Aprils go by as “too busy,” and in this case is the more ready to listen to sound advice with reference to fall planting.

One hindrance to general Fall orchard setting has been the persistent and foolish statement of the itinerant “tree agent” that it was by far the best time. The intelligent orchardist knows it is not “the best,” nor even as good a time as April for transplanting, yet because of the great leisure to do a thorough job, late September to early October is a highly favorable time, and there should be very few lost trees.

But let the careless worker be warned—if he won't take pains he should never transplant anything in the Fall but fence posts.

A great deal has been said about nurserymen “stripping” their Fall-lifted trees of leaves—that it was a very grave damage, and so forth, but this is nonsense. Vigorous growing stock will not drop their own leaves until some time in November and as early Fall transplanting is three times as favorable for a tree as late Fall transplanting, stripping is inevitable. Otherwise the evaporation from clinging leaves would soon shrivel the young wood. It is the nurseryman's business to know his business, including the care of young, tender trees.

The early Fall-set tree should throw new, “white” roots several inches in length before Winter, and such a tree will never Winter kill.

It is the late-set, carelessly set tree that dry-freezes dead—from zero gales of mid-Winter. If its root connections are so established before hard freezing weather that the top is well supplied with moisture it is sure to live.

Properly speaking, there is no such thing as “preparation of the land” for Fall setting orchards. The more it is plowed and harrowed, the surer it is to Winter wash and become gullied. This is presupposing that the land is more or less on a slant as it should be. Like any other field going into winter quarters, the surface should be thoroughly protected by some cover crop. In Spring setting we throw out three deep furrows along each tree row to save hand digging. We never dare do this in Fall, however, the holes are all hand dug and hand filled.

The Layout

As to general planting distances and the question of fillers, it is not safe to specifically advise. When we began planting (almost thirty years ago) 33 feet was the standard, and ten years ago 40 feet was advised by leading growers almost everywhere. At the present time, the permanent distances advised by experienced orchardists of southern New England and New York State are all above 40 feet, and they sometimes name 48 or even 50 feet, though we consider these extreme. There ought to be room on an acre for

By DAVID STONE KELSEY

30 to 36 standard apple trees according to variety.

Years ago I saw Baldwin apple trees on the upper benches of the Mohawk River (southern Saratoga County) with a spread of 60 to 68 feet—over seventy-five years old and bearing twelve to fifteen barrels of magnificent fruit—yet I afterwards set a thirty acre orchard (in the same county) 28 x 40 feet standards with an equal number of fillers, making the orchard stand 28 x 20, and never regretted these figures, which thin down as follows:

With fillers 28 x 20, 80 trees per acre (allowing for aisles).

With fillers removed 40 x 28, 40 standard trees per acre (or 40 x 35 feet if every other tree is taken from every row, odds from one, evens from next).

Final stand 56 x 40, 20 trees per acre, if they live to need this second thinning.

We are firm believers in the rectangular plan exemplified by the above. It leaves the trees always in “rows,” with room each side for spraying and cultivating. In the Connecticut peach belt for instance, we set 80 peach trees in with these 80 apples, the orchard standing 14 x 20 feet—until the peach trees are rooted out. Land is valuable to us, and time is still more valuable—the time of the spraying gang and team as it passes from tree to tree, the time of the weekly harrow team, and that of the picking and packing gang.

Furthermore, it is natural for all trees to grow in clusters, for mutual protection against gales, the heaping snows of winter, and bare ground—swept of snow and fallen leaves. If the argument of poor air drainage is raised against such thick setting, we attend to that in the first place by never planting even one tree in a frost pocket or upon other than sloping, well air-drained land.

The High Points

We wish to have our trees for fall setting lifted from the nursery rows the last ten days of September, and to personally see that only trees of mature, well-ripened tip buds are then taken. These trees must be immediately stripped, and without exposing the roots to the least drying, packed and taken by truck to the field where they are to be planted and there—also promptly—root puddled and carefully heeled in, no matter when the real transplanting is to begin—whether in two days or three weeks.

This first process is very important. Any young tree so lifted, stripped, puddled and heeled into warm, moist ground will begin to “callous” in a few days. This is nature's process which must precede the growth of new, white roots so necessary to insure that tree's wintering well in its new location. We use the finest clay obtainable, cream-thick, for puddling, first, of course, smoothly cutting all bruised root-ends.

We try to set trees in every hole opened that day so that the soil will not be chilled. A planting gang is a boss and two helpers, one a boy with a

wheelbarrow carrying trees, their roots thoroughly protected. The boss “sets” the tree by placing it in position, with one hand, where it is held by the “wheelbarrow boy” while the other assistant shovels in the finest topsoil, the boss working carefully among the roots with two hands until each is well imbedded, and so covered as to admit thorough tramping, the final operation. The whole taking about two minutes, a good gang should so set 200 trees a day.

The tree is thus left standing in a hollow two or three inches deep and about three feet wide which we are in no hurry to fill. The warm sun striking in through October promotes callous and new root growth.

Ultimately however, one pound of fine bone or acid phosphate is spread about the tree and the whole a little more than filled and again tramped solid. Besides that, later, a number of spades full of solid earth are mounded about the tree trunk itself, to hold it firmly.

We never prune a transplanted tree until after setting, and never a Fall-transplanted tree until Spring. If winds and rains loosen the tree trunk in the ground at all it is mounded again—and more thoroughly. In the Spring the tree is early and properly cut back, but we are in no hurry to level down that “mound,” that is a part of the “handwork” in the growing season.

I will say that I enjoy reading your paper very much, as it always has some good things in it. I enjoy it also because there is so much good reading in it.—Ray L. Cranston, Alabama, N. Y.

“The Truth About Wire Fence”

SOLUTION OF THE MYSTERY THAT HAS COST FARMERS MILLIONS OF DOLLARS

A cedar post outlasts a pine, so two rolls of wire fence may look alike, and cost the same, yet one will last twice as long as the other. Our circular solves the puzzle and shows you how to save that 100 per cent. You can know what you are buying just as surely as you can tell Oak from Poplar.

STANDARD OIL CO. OF NEW YORK
26 Broadway

BEFORE YOU BUY A WINDMILL

Carefully consider the following facts: A year's supply of oil is sent with every Aermotor

The Auto-oiled Aermotor is the Genuine Self-oiling Windmill, with every moving part fully and constantly oiled.

The Auto-oiled Aermotor has behind it 8 years of wonderful success. It is not an experiment. The double gears run in oil in a tightly enclosed gear case. They are always flooded with oil and are protected from dust and sleet. Oil an Aermotor once a year and it is always oiled. It never makes a squeak.

You do not have to try an experiment to get a windmill which will run a year with one oiling. The Auto-oiled Aermotor is a tried and perfected machine. Our large factory and our superior equipment enable us to produce economically and accurately. Every purchaser of an Aermotor gets the benefit from quantity production. The Auto-oiled Aermotor is so thoroughly oiled that it runs in the lightest breeze. It gives more service for the money invested than any other piece of machinery on the farm. The Aermotor is made by a responsible company which has been specializing in steel windmills for more than 30 years.

NEW LAMP BURNS 94% AIR

Beats Electric or Gas

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal oil).

The inventor, R. M. Johnson, 642 N. Broad St., Philadelphia, is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him to-day for full particulars. Also ask him to explain how you can get the agency, and without experience or money make \$250 to \$500 per month.

Park Avenue Hotel

Re-Rooted Three Year Palmetto Asparagus Roots for Fall planting. Rhubarb, Horse-Radish roots, Grape vines. **WARREN SHINE, WOODBURY, N. J. Root Specialist**

League Announces October Prices

New York Farm News—Horticultural Society Reports Fruit Outlook

THE Dairymen's League Cooperative Association, Inc., announces that the prices for October milk will be the same as those of September. These prices were announced in the issue of American Agriculturist of September 1, as follows, quotations being given for milk produced in the basic zone of 201-210 mile zone from New York City for 3 per cent milk:

Class 1—For milk that goes into fluid consumption, \$2.98.

Class 2a—For milk going into the manufacture of cream, \$2.05 per 100 pounds. There will be differentials of from 20c to 35c per hundred added to the price, depending upon the disposal of the skim milk. These differentials hold throughout where the disposal of by-products are concerned.

Class 2b—For milk going into the manufacture of plain condensed milk, ice cream and cheeses other than mentioned in Classes 2c and 4b, \$2.40 per 100 pounds.

Class 2c—For milk going into the manufacture of soft cheeses, \$2.35 per 100 pounds.

Class 3—For milk going into the manufacture of powdered, condensed and evaporated milk and hard cheeses, \$2.25 per 100 pounds.

Class 4a—For milk going into the manufacture of butter, the price will be determined by average New York quotations of that commodity of 92 score.

Class 4b—For milk going into the manufacture of American cheese, the price will be determined by average New York market quotations.

NEW YORK APPLE CROP SHORT

The New York apple crop will be considerably below that of last year, according to R. P. McPherson, Secretary of the New York State Horticultural Society. Mr. McPherson's statement is based upon a survey conducted by the Society among its members. Briefly the report of the survey shows that the crop will be 86 per cent of last year's, and Western New York apples are somewhat below the Hudson Valley. Mr. McPherson's report, is as follows:

"Reports received from 257 members indicate that on or about September 1, 55 per cent of a normal crop of apples was expected. A year ago 64 per cent of a normal crop was expected. This indicates that the total crop in the principal fruit sections of the State is expected to be about 6-7 (86 per cent) as large as that of last year. Outside of the important fruit sections the reduction compared with last year is much greater.

"Quality this year is much poorer than usual in Western New York, and better than usual in sprayed orchards in the Hudson Valley. Members in Western New York report that only 48 per cent of the apple crop will pack as 'A Grade' as defined by the New York State Law. At this time last year they estimated 59 per cent. In the Hudson Valley members estimate that 68 per cent will be 'A Grade,' compared with 59 per cent last year.

"Taking into consideration both the reduction in the total crop, and the reduction in the percentage of sound fruit, the indicated production of 'A Grade' fruit is only 4-5 (81 per cent) of the corresponding indication at this time last year. This agrees closely with the estimates of members regarding the number of barrels of fall and winter apples of marketable quality that they will harvest this year.

"Only a few members submitted reports on prices, most stating that no offers had been received. On a tree-run basis the most common report from Western New York was \$2.75 to

\$3.00 per barrel, but a number of men reported from \$2.00 to \$2.50. In the Hudson Valley \$2.00 was the price most commonly reported as being offered by buyers, other reports running from 80c to \$3.00. Reports regarding the prices being offered for 'A Grade' winter apples, packed, were almost equally variable.

WEATHERBY JOINS THE AMERICAN AGRICULTURIST

It gives us much pleasure to announce that Mr. E. C. Weatherby has joined the staff of the American Agriculturist as manager of the Circulation Department.

One of the fundamental purposes of American Agriculturist is to build up a staff of workers who are or have been

E. C. Weatherby

farmers, whose training has been along agricultural lines, and whose whole experience will give them a sympathy and understanding with all the problems with which farmers must contend. We are very enthusiastic that Mr. Weatherby has consented to come to American Agriculturist because he more than fills all of these qualifications.

He was born in the hills of Tompkins County, New York, on a 250-acre farm, about which Mr. Weatherby says: "This farm has been operated profitably enough to give my sister and myself high school and college advantages and to make a home that is the best place I know to go to."

After graduating from the New York State College of Agriculture, Mr. Weatherby returned to the home farm where he spent two years in partnership with his father. Then in 1917 he was chosen by the Cayuga County Farm Bureau as its county agent, where he remained for three years, becoming known and liked by farm people in every community of that great county. The last three years Mr. Weatherby has been assistant secretary of the Grange-League-Federation Exchange, in charge of organization work and advertising and through that work he has learned the problems of farmers throughout the entire territory to which American Agriculturist goes.

In commenting upon his becoming a member of the American Agriculturist staff, Mr. Weatherby said: "I want the farm folks to know that I am not leaving cooperative work, but just entering another field of service to them. I believe the American Agriculturist editorially

is the best farm paper in New York State. While it has a circulation of over 130,000 farm families, its influence is so good that it needs even more readers, and farmers and organizations need the American Agriculturist. Therefore, my position will be one of service." Mr. Weatherby will begin his service October 1.

We are glad also to announce that Mr. H. L. Vonderlieth, who has had charge of the Circulation Department, will continue with the paper in an advisory capacity. Mr. Vonderlieth, who is also circulation manager of Today's Housewife, has been working during the past year on a part-time basis for American Agriculturist. Under his direction, the circulation of American Agriculturist has increased from 106,000 to 130,000.

The reason Mr. Vonderlieth is unable to continue as circulation manager is, that he could not, because of other work, give his entire time to it. In his service to American Agriculturist, he has made thousands of friends, both in the headquarters office and in the country, all of whom will be glad to know that he is to continue his contact with the paper.

NEW YORK COUNTY NOTES

Cortland Co.—The severe drought of the last two months continues in most parts of the county. Pastures are affording but little feed. Some farmers are filling their silos as corn is drying very badly. Potatoes will probably be a 50 per cent crop. Cabbage is looking good and will be a good crop if it rains soon. Eggs are selling from 38 to 40c, early potatoes \$2 per bushel.—G. A. B.

Oneida Co.—The hay crop, which was good as to quantity and quality, was secured in good condition. Oats harvested quite well. Some threshing done. Recent showers have started after feed. Some good pieces of corn, but mostly below standard. Potatoes have been looking good. Frost did considerable damage in northern part of the county. Fresh eggs sell at 38c, new potatoes \$1.50 to \$2 per bushel. The flow of milk is shrinking.—E. N. A.

Fruit in the Medicine Chest

(Continued from page 209)

be grapefruit, oranges, prunes or some such thing when we cannot get apples, and often when we do have them. If apples from our own orchard fails, as they do sometimes, we know that somebody else has them and we will get them, no matter at what price, for they are our medicine chest. It costs to get fruit when it is scarce. What of that? At any price it is better than a long siege with rheumatism or some other form of toxic poisoning, and a big doctor's bill at the end.

I am convinced that no matter where we live, or what may be the expense, fruit ought to have a place on the table of every family all the time. I have laughed a good many times over a supper I had once at the home of a half-breed Indian in southern Illinois. I was then in the employ of Uncle Sam, and circumstances were such that I was away out in the country for the night, and this was the home at which I must stay. The wife in that home did her best for the stranger within her gates. She brought out fourteen different kinds of sauce and I sampled them all!
